# The Bee-Keeper's Review

for December, 1896, contains a double-page illustration of four out-apiaries located near Flint, and managed by one man for comb honey, with almost no help. A portrait of the owner, and a description of his methods, are also given. There is also a fine picture of bees secreting wax and building comb, made from a photograph taken by the editor. Mr. Taylor has a long article on hives. There is the review of foreign journals by F. L. Thompson; Hasty's three-page review of the American journals; the usual extracts and editorial comments, etc.

The REVIEW is \$1.00 a year, or \$1.25 for the REVIEW and the book, "Advanced Bee Culture;" \$1.75 for REVIEW and a fine tested queen—the queen to be sent early in 1897. New subscribers get the December issue free.

W. Z. HUTCHINSON, Flint, Mich.

## Cheap Freight Rates.

Philadelphia has direct line of steamships to Florida, New York State, and all points in New England.

Remember, Wm. A. SELSER is at the old stand, 10 Vine Street.

Can ship at such low rate and at Root's lowest prices, on all Root's goods that they can be delivered nearly as cheap as if your place was within a few miles of Medina, Ohio.

## The Danzenbaker Hive

Has valuable features possessed by no other, and is surely winning its way; was awarded Special Diploma, and First Premium for COMB

HONEY, at Mich. State Fair, 1896. Address Francis Danzenbaker, Medina, Ohio.

Care The A. I. Root Company.

## Dovetailed Hives.

Sections, Extractors, Smokers, and every thing a Bee-keeper wants. **Honest Goods at Close Honest Prices.** 60-page catalog free.

J. M. JENKINS, Wetumpka, Ala.

## Our '97 Catalog

It will be out January 15th. Send for it. It is full of information.

"Our Supplies are of the Best."

"Our Prices are very Low."

## Southern Bee-keepers

Should write for prices on goods, delivered at their station, freight paid.

Apiary, I. J. STRINGHAM, Glen Cove, L. I. 105 Park Pl., N. Y. City.

## Coming!

The year 1897 is coming, and we are happy to inform our friends and customers that we are now better prepared than ever before to fill your orders for queens and bees. We have the largest stock ever operated by us, and we mean to be ready with plenty of bees and queens to fill all orders without delay that are sent to us.

Bees by the pound, \$1.00; ten or more pounds, 90c each. Untested queens for 1897, \$1.00 each in February, March, April, and May; \$5.00 for six, or \$9.00 per dozen. For larger amounts write for prices. Have your orders booked for your early queens. Safe arrival guaranteed.

Root's goods, Dadant's foundation, and Bingham smokers. A steam bee-hive factory, and all kinds of bee supplies.

The *Southland Queen*, the only bee-paper in the South, monthly, \$1.00 per year.

Send for catalog, which is almost a complete book on Southern bee-keeping, giving queen-rearing in full, all free for the asking. If you want full information about every thing we have, and the bee-book, don't fail to ask for our 1897 catalog.

The Jennie Atchley Co.,  
Beeville, Bee Co., Texas.

BUFFALO, N. Y. Unsurpassed Honey Market.  
BATTERSON & CO. Responsible, Reliable,  
Commission Merchants. 1897. and Prompt.

40,000

## The Nebraska Farmer

has made a contract with the Nebraska Club to print for them 40,000 copies over and above the regular weekly issue, each month for six months, of reliable information about Nebraska.

If interested, send for copy free, to MR. CHAS. E. WILLIAMSON, Secretary Nebraska Club, Omaha, Neb., or

NEBRASKA FARMER CO.,  
Lincoln, Neb.

## Six Months Free==Am. Bee Journal!

We have some extra numbers of the Bee Journal since July 1, 1896 (all complete, making 26 copies to Jan. 1, 1897) which we will send free so long as they last, to the new subscriber who mentions this offer when sending us \$1.00 for the Bee Journal for 1897. This makes 18 months for only \$1. Or, we will mail the 26 numbers mentioned, for only 25 cts. Sample copy free. Address

GEORGE W. YORK & CO., 118 Michigan St., Chicago, Ill.

In writing advertisers please mention this paper.

A JOURNAL DEVOTED TO BEES AND HONEY AND HOME INTERESTS.

ILLUSTRATED SEMI-MONTHLY

Published by THE A. I. ROOT CO. \$1.00 PER YEAR MEDINA, OHIO.

Vol. XXV.

JAN. 1, 1897.

No. 1.

STRAY STRAWS

FROM DR. C. C. MILLER.

ISN'T FIVE DOLLARS a pretty high price to figure for a swarm of bees without any hive, as H. S. Jones reckons on page 892?

L. A. ASPINWALL measured many queen-cells at the time the egg was laid in them, and in every instance he found the measurement across the mouth of the cell was the same as that of a worker-cell.—*Review*.

SEVENTY TO EIGHTY PER CENT as much comb as extracted is what A. F. Brown says he can produce, and he has produced both kinds by the ton. He thinks more comb honey should be produced in the South.—*American Bee Journal*.

AMERICAN BEE JOURNAL reports the case of a young lady whose hands are poisoned by propolis when scraping sections. Scraping sections produces on my wife something like hay fever.

ELIAS FOX, p. 890, says a swarm with a clipped queen will invariably return to the old hive "unless they are joined by another swarm that has a queen." He might add, as another exception, that they may enter any hive to which a swarm has returned but a short time before.

HASTY says it's to please the dealer that sections less than one pound are worked for, and he thinks the dealer will refuse to be pleased the moment the point is reached where nobody will admit they are pounds. Correct. [Perhaps partly; but the dear bee-keeper has something to do in the matter. See my answer to another Straw on this subject.—ED.]

I AGREE with Elias Fox, p. 889, that "Nature has forbidden" the bees to make holes in grapes, the only question being how. I think, by making it a physical impossibility; he, that they are abstainers on moral grounds, if I understand him. It's a small matter anyhow. We agree on the main question, that bees *don't* make holes in grapes, and that's *not* a small matter.

THE *Northwestern Christian Advocate* interviewed officials of 19 leading railroads as to drinking-employees. In every case, drinking while on duty is absolutely prohibited; and with the majority of roads it is clearly intimated that employees who wish to retain their positions, must refrain from the use of intoxicants when off duty as well.

E. E. HASTY, in *Review*, comes to the support of A. I. Root, and says, "And we'll settle on the banks of the pleasant O-h-i-o," is the authentic version. Say, what business have you Ohio fellows to know how we eastern people sang about going west to Ohio? But it may be that when the emigrants from Pennsylvania reached Ohio they couldn't express their feelings without interpolating "pleasant."

A. B. ANTHONY thinks 17 days for development of a queen 35 years ago was all right, but that it has been reduced to 15 now, because, when the old queen leaves with a swarm, the one that matures first kills the rest, so the early-maturing trait has been perpetuated and intensified. But, friend A., if two days have been cut off in 35 years, it must have taken about 35 days for a queen to hatch in the time of Columbus, and I leave you to figure what it must have been in the time of Samson.

SOMNAMBULIST—the one and only—says in *Progressive* that he has private customers not only as far as Texas and Idaho, but as far north as Chicago and as far east as Ohio, and, with a twinkle of defiance, he says something about "next door to the Home of the Honey-bee." Say, Bro. Root, can't we some way combine forces and down that fellow Sommy before he establishes regular agencies at Marengo and Medina? [If he has done it already, we'll establish an agency at *his* door, to get even. But, where, oh where! is Naptown and where is Dreamland?—ED.]

FROM OUT the none too full ranks of our lady bee-writers passed away, Nov. 21, Mrs. A. L. Hallenbeck. Judged by her writings, she was a woman of beautiful spirit. [Mrs. A. L. Hallenbeck's picture appears in the group of bee-keepers as they assembled at Lincoln—see No.

6. The manner of her death—being thrown from a wagon during a runaway—was peculiarly sad. Although she had not figured very prominently in the columns of GLEANINGS, she had written not a little for some of the other bee-periodicals. I well remember, her kindly face and pleasant handshake at the convention.—Ed.]

PROF. COOK says, in *American Bee Journal*, "I think there is every thing to encourage the breeder in bee-keeping. I think that there has been very little real scientific breeding yet practiced. If I am right it is a new field; and a wider, surer success awaits the earnest, conscientious, capable artist in this line of work." [Prof. Cook may be right, but at the same time I can not help feeling that Doolittle, Alley, and the Atchleys have got down pretty near to the scientific methods of queen-rearing.—Ed.]

GRAVENHORST indorses GLEANINGS' advice to melt candied honey slowly, and adds: The more slowly the crystals are dissolved by mild heat, the less the honey loses in aroma and color. [I do not know when we gave such advice; but all the same it is good. Our method of liquefying candied honey in square cans is to immerse a number of cans within an inch of their tops in a vat of hot water, the latter being heated by a jet of steam, and turned off. The cans are allowed to stand thus about half a day, when the honey will be brought to a liquid condition. It is unnecessary to state that we remove the caps before liquefying.—Ed.]

"AS REVEALED by an inquiry in the *American Bee Journal*, the importation of *Apis dorsata* by the U. S. Government is favored by such distinguished apiarists as Prof. A. J. Cook, Mrs. L. Harrison, E. France, J. M. Hambaugh, W. G. Larrabee, G. M. Doolittle, and G. W. Demaree."—*American Bee-keeper*. But please add, worthy A. B. K., that Mrs. Harrison wants it for the Seminole Indians, who never keep bees in a hive; that Larrabee says, "Yes, if they would not turn out like the English sparrow;" and that, while Demaree would be glad to have it done, he fears it might fail. Also that, while these 7 more or less favor it, 14 others on the same page oppose it.

HUTCHINSON thinks there may be some progress in bee-keeping, but hardly expects any thing important. Now look here, Hutchy, no one was hunting for or expecting the extractor when it came. How do you know that surprises of that kind are all over? [It is true, no one was hunting for or expecting the extractor when it came. The same may be said of comb foundation. But I want to tell you that I am hunting for and expecting some startling developments in the way of deep cell foundation, or what some might call partially drawn comb, said comb being within the reach of every bee-keeper, and as light per square foot as the thin

foundation. Hip, hip, hur— Well, I guess I won't just yet. Perhaps the whole thing—well, I am not going to say any more.—Ed.]

□ WHICH IS NICER for the table—square or oblong sections? In *American Bee Journal*, 8 say square; 3, oblong; 7, either; 4, to suit the shape of the plate. [I wonder if the eight ever saw an oblong and a square section side by side. So far as I am concerned I should be inclined to agree with the seven. Difference, if there be any, would be a matter of notion or taste. A square section will not remain on the table very long before a slice will be taken off from one side or end, and then it will look oblong. The oblong will probably have a slice taken off from one end, then it will be square. I do not suppose the housewife ever thinks which looks better on a plate—a square or oblong cake.—Ed.]

MR. EDITOR, you are altogether too modest in your statement on p. 890. I think no one in the last 40 years has disputed that it is a common thing for workers to hold young queens in their cells and feed them there. When there's piping and quaking in a hive, lift out the comb and you'll see the quaking queens thrust their tongues through the slit. "Doolittle on Queen-rearing," p. 77, says, "Put a little honey around the end of the cell, so that she can feed herself before coming out of the cell." [I did not mean to be so modest; but I did not wish to be apparently too positive regarding the number of queen-cells that had been observed on one comb. Yes, come to think of it, it is pretty well established that queens are sometimes confined in the cells.—Ed.]

HON. R. L. TAYLOR put on four colonies 452 lbs. of unfinished sections, fed 378 lbs. of honey, and took 650 lbs. finished sections—1.7 lbs. honey for each pound gained.—*Review*. [The results obtained by Mr. Taylor I think are more favorable than the results generally secured by others in feeding back. In some cases I believe it has been reported that it was necessary to give two and even three pounds of honey for every pound of finished comb honey received back. While there is a good deal in knowing how and when to feed back, as a general rule the average bee-keeper had better let the practice alone. He will usually get more money in the end by cutting out his unfinished combs and selling them as chunk honey, and selling the extracted at market price, than to try to set good money chasing after poor.—Ed.]

□ SOME ARGUE that it's all right to sell sections by the piece, there being no deception in the case. Well, then, if it's right for the grocer to sell them that way, why isn't it right for the grocer to buy them that way? Just tell me that, will you? [Say, doctor, what do you want to rake up that old bone of contention for? I won't argue with you, at all. Yes, I

will, just a little bit. You can not get around the fact that bees fill a thin comb quicker, and that the honey is of better quality. Deep cells of honey do not ripen as well.

The grocer may be a wee bit dishonest, without meaning to be so; but I believe the bee-keeper in many cases finds there is more money in the production of thin combs, outside of any special call for them on the part of the buyers.

Oh, yes! it is all right for the grocer to buy what it is right to sell. We will pull together here. But say, doctor, if you think the thin  $4\frac{1}{4}$  sections are in line with the sunken bottles, what objection, outside of the fact that they won't fit your super, would you have to a tall section that would hold as much as your  $1\frac{1}{2} \times 4\frac{1}{2} \times 4\frac{1}{2}$ , and still be only 7 to the foot thick?—Ed.]

By R. C. Atkin.

Of names there is no end. We have the "Rambles," "The Sunny Southland," "Pickings by the Way," and others, and now comes "Ridgepole Musings." At first thought you may call this a high sounding name; yet in choosing it we have no thought of a "loud" or egotistical heading or title. J. H. Martin appropriated for his general heading the title of "Rambler," a very characteristic name. "The Sunny Southland" also was peculiar, and somewhat of an index to the writings, though many subjects were treated. It was suggested to the writer that "The Woolly West" would be a good heading, but to me it seems inappropriate. Geographically we are located near the center of the United States, not in the West. Again, we are well nigh the top of the ridgepole or backbone of the continent—the Rocky Mountains. Since, then, our point of view is both central and elevated we may speak of many things; and in speaking we desire to be guided to the truth, and to say only that which may be right and for the good of all concerned.

#### ALFALFA.

There is a great amount of misunderstanding in regard to alfalfa; but before we enter upon the discussion of the plant itself, let me speak of some general conditions in the districts where the plant grows.

There is—or seems to be—a prevailing opinion throughout the East, that Colorado and other alfalfa-growing States are a sort of bee-keeper's paradise. I wish to give the fraternity a true conception, if possible, of the facts. Let us begin at the Missouri River and look

over Nebraska and East Colorado to the mountains. Think of the slope of the country from the river westward, beginning at a rise of 6 or 7 feet to the mile; and as you pass on westward the rise increasing until at or near the mountains there is a rise of about 20 to 30 feet to the mile. The average rise between Omaha and Denver is over 9 feet to the mile. The rise is more gradual at first, but quite rapid near the mountains. Now picture in your mind an ordinary rolling country with hills (not bluffs, but a gentle rise from the streams) being from 40 to 100 or more feet high. The slope from the streams may be so gradual as to make a nice farming land and terminate in a tableland, or it may be variegated; but whatever the general characteristics of the face of the country, do not forget that there is a *general* slope, with all streams pointing and flowing rapidly in the one general direction.

Now, a country to successfully irrigate must have the rapidly falling streams and general fall of the face of the country. The ideal place to irrigate would be a country that, in common expression, would be called level, but in fact has sufficient fall to make *good drainage*, the highest points or ridges between streams being low enough that ditches taken from the streams may be carried to the tops of the ridges without having to be many miles in length. Irrigation is accomplished by taking the water from the streams by means of the ditch, with sufficient grade to make the water flow nicely and yet not wash or cut in the channel. Thus the water is brought above (on higher ground) that to be watered, and then carried in smaller ditches and divided and subdivided and spread over the land.

It seems that the general air-currents have an eastward trend. These currents carry moisture, the moisture being caused to precipitate by coming in contact with other or contending cold currents. The combination of heat, cold, moisture, and air-currents brings about our rainfall. Now, the general trend of air-currents being from west to east, they must pass over the Rocky Mountain chain that runs north and south. There is on the mountain-tops intense cold, as at all high elevations, and this cold condenses the moisture in the air, causing it to fall upon the mountain-range and not upon the plain. The air, in crossing the mountain-range, seeks, or is drawn to, the depressions or valleys, carrying more moisture to some parts than others. Reasoning from this you will see that there can not be a full precipitation along the east side of the range; and the higher and more extensive the mountains, the more moisture they catch, and the more dry will be the territory lying east.

Alfalfa is a clover, and a perennial. The other clovers are more or less strictly biennials, and must be continually reseeding if a meadow

is to remain in full growth; but alfalfa differs in the two essential features of lasting for ever, and having a very long thick tap-root that penetrates far in search of moisture. Now, remember that there is a vast territory within the mountains, and east of them, that is subject to drouth because the mountains "catch the moisture" in the high altitudes, and you will see the necessity of a plant that can stand extremes of heat and drouth. Here let me quote from a report of the Kansas State Board of Agriculture as I find it in the *Denver Times Year Book and Almanac* for 1896, page 296:

"Alfalfa is one of the very ancient forage-plants, having been cultivated by Greeks, Romans, and Egyptians in very early times." [Note that irrigation has been practiced in Egypt for ages, being in vogue at the time of Israel's sojourn there]. "In later periods, and especially within the present century, it has been grown by nations in the warmer parts of Europe. It has been known in South America for a long time, and has been cultivated by the people in the arid regions along the west coast. From this region it was carried to Mexico and California, where it has proved a veritable Godsend. Its especial quality is that it can stand a prolonged heat and drouth."

"Inger-oll, of the Nebraska Agricultural Experiment Station, says, 'There is not a crop raised as a farm crop that will pay better returns in cash per acre. Alfalfa, with corn, should be the watchword hereafter in Nebraska.' Alfalfa is a rather slender-growing, branching plant, with leaves much smaller than those of the small June and mammoth red clovers. It is of a peculiar dark, rich green color, and is a marked feature of any landscape where one can obtain an extended view. Like other plants of this class, it has a single strong tap-root, which throws off numerous small branches as it passes downward. It goes to a great depth in search of moisture. Roots have been known to penetrate to a depth of over twenty feet in an open, porous soil. On account of the size and toughness of the root it is not easily broken. For this reason, land selected for alfalfa should be devoted to that crop for a series of years. When broken up, however, the soil is in most excellent condition for wheat, potatoes, or almost any crop. Alfalfa is a nitrogen-producer, and hence improves the land on which it is grown. All clovers, and especially alfalfa, are valuable for the express purpose of renewing the fertility of the soil."

"An Ohio alfalfa-grower, after ten years' experience, says that the land should be copiously irrigated before sowing the seed. This insures prompt and complete germination. This is a point of vital importance, for without a dense and uniform stand of plants it is not possible to make a high quality of alfalfa hay. Another advantage secured by irrigation before seeding

is that it supplies the earth with a reservoir of moisture sufficient to sustain the plants in unchecked and vigorous growth until they are strong enough to bear irrigation without injury. The critical time with alfalfa is the first six weeks of its growth. By soaking the earth before seeding, the plants make vigorous growth until they are ten or twelve inches high, after which they may be irrigated with safety."

"Alfalfa is not safe, as pasture, for either cattle or sheep. This matter has been thoroughly tested until it is admitted that the only safe way is to keep herds out of alfalfa-fields entirely. It is true, however, that both cattle and sheep will sometimes feed on alfalfa pasture for days without ill results. But sooner or later trouble arises. Under certain conditions sheep become inflated like balloons, and die suddenly from eating moist alfalfa. The same Ohio farmer says that horses and swine can be pastured on alfalfa with entire safety, and with profitable results."

It appears, then, that alfalfa is almost a necessity in this arid or semi-arid country, because it is the only forage-plant that can cope with and endure the adverse conditions of climate. It is a splendid crop for hay, both to fatten and to produce milk. For horses that are laboring it is a little too "washy," so that intended for *horse hay* is allowed to mature and become rather woody, being cut at about full bloom; but if wanted for cow feed it is cut before blooming or just as it has fairly begun to bloom. It is rather heavy in growth, being between red and sweet clovers, so if allowed to reach a mature state the stems become quite woody. Horses will eat the woody stems quite freely, but not so freely as mules; but cows will not eat the hard stems unless driven by hunger, so for cow feed it becomes necessary to cut early. For a rather soft fat, and for milk and butter, alfalfa hay is a very fine seed; but to pasture cattle and sheep it seems to be a failure because of bloating. It is *very risky* to turn cattle upon alfalfa.

Now as to the extent to which this plant is cultivated. Observe that there is a vast territory between the mountains and the Missouri River. It is out of the question to think of growing alfalfa or any thing else near the mountains except on the bottom lands, and little there unless irrigated. I have been told that there is quite a little grown in the vicinity of Garden City, Kansas, without irrigation; but it is on bottom land that is all underlaid with water but a few feet below the surface.

The rainfall increases as we get away from the mountains, being more or less in certain districts, owing to height and extent of mountains and distance north or south, until there is sufficient to produce crops with the rainfall alone. East Colorado and West Kansas and Nebraska, to near the center of these States,

are and will be subject to drouth in greater or less degree, as the seasons are generally more or less dry, but always drouthy.

It is evident, then, that the growing of alfalfa (or any thing) can not succeed in Colorado, and only to a very limited extent in West Kansas and Nebraska, except where watered. The streams are *utterly inadequate* to supply the water necessary to cover this whole area, even if all that flows throughout the year be used; and when we remember that the greatest water-supply often comes before it is needed or can be used, you will at once see that *only a very small portion* of the country can be set to alfalfa.

Let me here repeat what I have heretofore written of the alfalfa districts in Colorado (or elsewhere in the mountain districts), that the places where bees will do well on alfalfa pasturage are as garden-spots or dooryards in comparison with the *vastness of the country in which they are found*. The irrigated districts are confined almost exclusively to the valleys. True, water is carried in ditches for 5, 10, 20, and even 50 to 75 miles or more. Many ditches are made 10 to 20 feet wide on the bottom, and carry a depth of 3 to 6 feet.

*Continued.*

## RAILROADS AND COMB HONEY.

COMMISSION MEN AND THE HONEY-PRODUCER;  
BOTH SIDES FAIRLY SET FORTH.

*By C. F. Muth.*

This would be a nice world of ours if everybody knew what he was about and would govern himself accordingly. As it is, we have got to have a certain amount of patience with our neighbors and friends, who, no doubt, have to reciprocate, occasionally, for our shortcomings. By my correspondence with some of our freight agents I am reminded that the discussion of the subject of comb honey might be of some use to a number of our friends. Most shipping-cases received by us this season were almost perfection; i. e., they were neat, showed the honey to advantage, and the inside space was such that there was about  $\frac{1}{8}$  to  $\frac{1}{4}$  inch space between the sections and the walls of the case. Put up in such manner the comb honey is apt to arrive safely if the railroad employees, while loading and unloading, would handle the cases as they would eggs. It is a notorious fact that comb honey is damaged while being loaded on the cars or while it is unloaded on its arrival. If those baggage-smashers would *set* down those cases instead of throwing or dropping them, much loss and annoying correspondence would be saved to shippers and dealers, and relations between consignees and railroad companies would be more pleasant. Unless there is a collision, or cases are upset or flung about, combs hardly ever break while in transit; and they

do not break if hauled in a wagon over a rough pavement. Cincinnati has no rough pavement. I have this morning the assurance of Gen. A. H. McLeod, the General Freight Agent of the C. H. & D. R. R., that all of their employees will be instructed to handle comb honey the same as they would eggs. We are now corresponding with the agent of the Big Four, and will do the same with others as soon as occasion offers. It should be your point, and it should be one of the duties of the officers of our bee-keepers' meetings, to see that every railroad employee receive similar instructions from headquarters.

We received a shipment of comb honey this season, for the damages to which the railroad companies could not be censured. All the cases were smeary on arrival. Not showing much breakage, however, they were washed off and placed in the store. Each case had honey oozing out at the bottom-board, and on each additional day the pool of honey on the floor, under each row, was getting larger. The cases held twelve  $4\frac{1}{4}$  sections, two sections in front row, behind the glass. They were too short and too narrow. The combs were pressed together so that the faces of most of them were bruised. They were not quite  $8\frac{1}{2}$  inches wide, so that the faces of the combs were bruised by pressing in the two sections. I am sorry for the poorly posted bee-keeper putting up his nice white-clover honey in such poor shape.

We are selling most of these nice combs without the sections, put up in butter-crocks and tin buckets. These cases were overhauled twice; but, who will buy a leaky case of comb honey? and leak they would. We have now placed all the good combs in new cases, and feel confident that they will sell in their present shape.

I feel sometimes disgusted on hearing so much of the dishonest honey-dealer and the city adulterators, although those parties are not at home in Cincinnati. I believe that the business is overdone in both directions. I don't remember the time when I have seen adulterated honey, and the public believes that most of the extracted honey is adulterated, because they see it so stated in the papers. It's not all "good sense" the friends of the bee-keeper bring to bear upon the public.

It is impossible for me to believe that the honey-dealer is on a lower level than the bee-keeper. I can believe it no more than that the business man in the city should be more dishonest than the farmer in the country. But there are scalawags in all classes of society and callings. Let us keep away from them, and post our friends how to put up their honey in safe and merchantable shape, and let us lose no time in impressing upon railroad companies the idea that our comb honey needs the same care as eggs. They will accommodate us if in their power. These are the first steps necessary for

a pleasant relationship between bee-keeper and honey-dealer. The next step is to keep away from scalawags, no difference whether they live in cities or in the country.

Cincinnati, O., Dec. 16.

[I am sure our readers will peruse this article with interest, coming as it does from a leading honey-buyer as well as bee-keeper. Friend Muth will perhaps remember that I have more than once taken up the defense of the commission man, and condemned at the same time the slipshod methods of the honey-producer. For instance, I would call attention to page 183, March 1st of our volume for last year. While it is no doubt true that bee-papers have of late put more emphasis on the dishonest practices of some "scalawag" commission houses (and there has surely been reason for it), I do not believe that any of them have felt that the producing class were as perfect as they might be.

Bee-keepers need to have brought to their attention over and over again the folly of putting first-class comb honey in ill fitting or miserably concocted shipping-cases, home-made, to save expense. The modern factory-made cases are almost perfect, and can be bought for less money than the usual home-made good-for-nothing worse-than-nothing substitutes.

Mr. Muth makes a good point in regard to having freight-handlers instructed by the managers of the railroad companies. I trust that commission men all over the country will take the matter up. Here indeed is something for the new Union to undertake.

Friend Muth expresses a doubt as to whether there is any such thing as adulteration of extracted honey. I do not know much about Cincinnati; but I do know, without any guesswork, that there is plenty of that kind of work going on in New York and Chicago, and I do know that our silence all along for several years has given honey-mixers altogether too much license.—Ed.]

---

### THE AMALGAMATION PROJECT.

By Thomas G. Newman.

In reply to Dr. Mason's article in GLEANINGS, pp. 855-7, I desire to say that, being invited to "make suggestions" or criticize the Constitution offered as a basis of amalgamation I candidly pointed out some of its imperfections, without allusion to any person, supposing that was what was being desired; but by the rejoinder of Dr. Mason, and the editorial remarks, it seems that an unpleasant personal controversy is invited. As I have no relish for such, and shall not indulge in it, I silently pass all that has been said. "Measures, not men," is my motto.

While I have no desire to dictate any thing, I certainly have the right to criticize such an important matter as submitting an imperfect constitution to vote. The members of the Union have the right to expect this of me, and I shall not disappoint them. In my criticism I have nothing to change, though I might add much more to it. The points I made are mainly incontrovertible. It is nonsense to state that

I made any decision in the matter of submitting amalgamation to vote; that was the duty of the Advisory Board, to which I immediately submitted the question. Dr. Mason's assertion to the contrary notwithstanding.

It is a fact that I gave an "opinion" publicly, that such an incomplete and imperfect document should be amended before being adopted by the Union, because of the difficulty and delay in amending it afterward. Have I no right to express an opinion? If not, since when?

The unkind personal remarks threatening my defeat at the next election are ungenerous and unwarranted. I never was a candidate for election or re-election. The members voted for me because they wanted my services; and when they want some one else, I shall retire with the satisfaction of having done my duty to the best of my ability. I hope my successor will do the same.

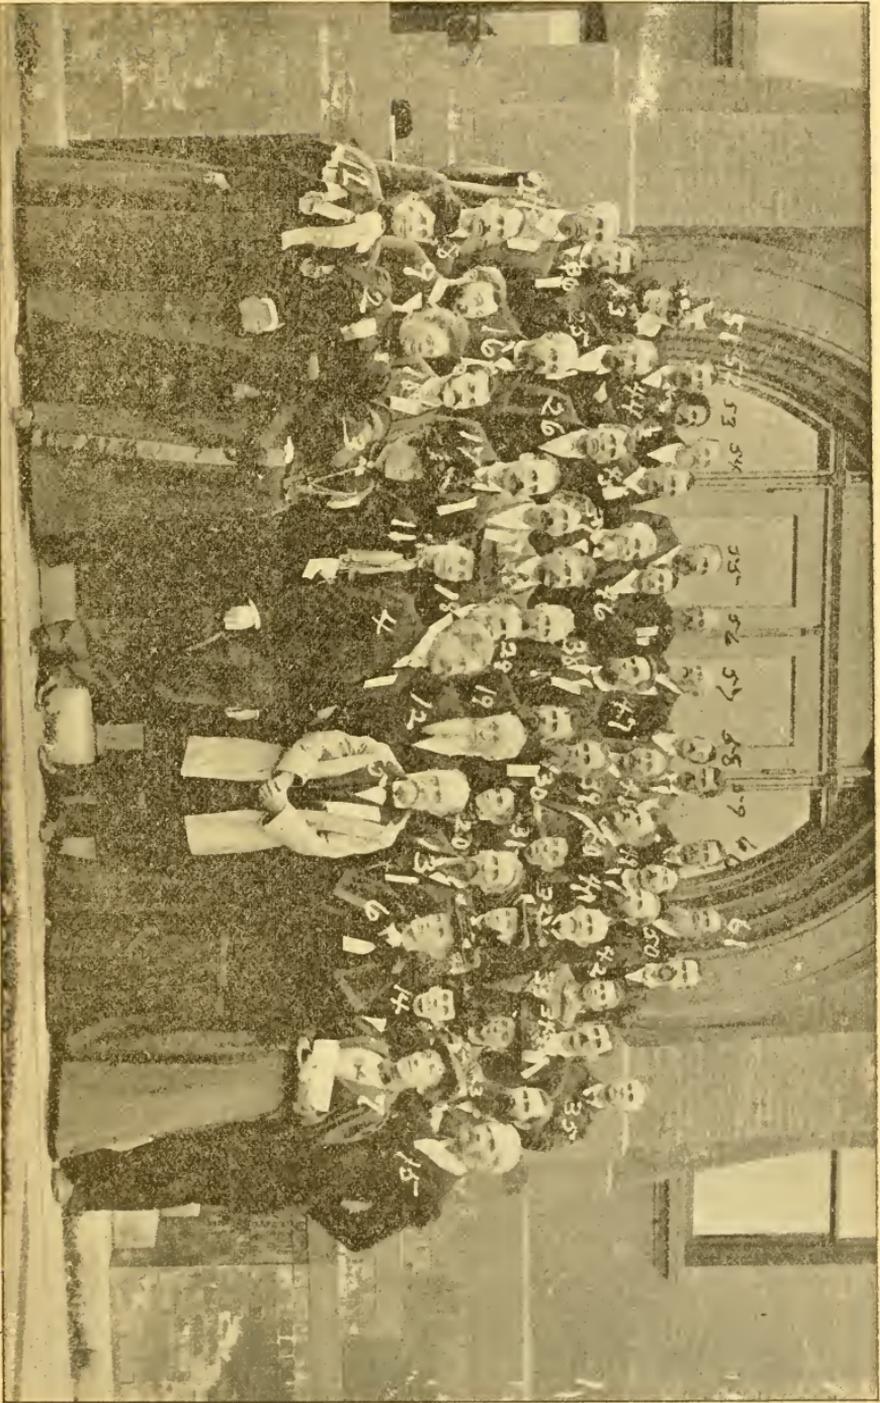

There are seven members in the Advisory Board; three favor submitting amalgamation to vote; three vote against it, and one, after adding many more criticisms than I made, adds: "Many will want to have it put to vote. I should say, submit the criticisms to each voter, and put it to vote." That decides the matter. Amalgamation will be put to vote at the next election.

If the inconsistencies I have carefully pointed out are to be disregarded, and ascribed to my "vivid imagination"—then the consequences must not be charged to me. I have carefully watched the interests of the members of the National Bee-keepers' Union for a dozen years, and successfully defended their rights in the courts of the land—from the police court to the very highest tribunal of the country. My aim is the same to day, by trying to prevent the serious mistake of too hasty and premature action, and thereby avoid the embarrassment which would naturally result therefrom.

[Neither Dr. Mason nor your humble servant had any desire to invite an unpleasant personal controversy. "Measures, not men," was also our motto; but when the man who had the measure in hand proposed to blockade it, then we protested. It may be true that Mr. Newman had no desire to dictate any thing; but when he said there was "nothing left for its advocates now to do but to await the action of the convention next year"—well, it looked like "a decision."

It is all right for him to give an opinion publicly; but what I criticised particularly was giving that "opinion"; too late for action at the Lincoln convention. If he had not apparently desired to blockade amalgamation he could very easily have laid his "opinion" on the merits of the proposed constitution before the Lincoln convention; for, as I have already pointed out, practically the same document was published three weeks before that meeting.

I have been very sorry that it seemed necessary to criticize Mr. Newman's course in this whole matter, but I have believed it to be my duty.—Ed.]

### WOOD VS. WIRE.

#### WOOD STAYS NOT SATISFACTORY IN BROOD-COMBS.

By R. M. Reynolds.

When bee-keepers, a number of years ago, began to use full-sized sheets of foundation in brood-frames they learned that fastening such sheets to the top-bar only was not a real good plan. The foundation, during the manipulations of the bees in the process of building out into comb, was pretty certain to stretch and take on undesirable kinks, twists, and bulges—breaking down sometimes and making a bad muss. To prevent the foundation from stretching and sagging, various devices have been tried; but I believe that wire in the frames has proven, in time, the most efficient, practical, and satisfactory. I have found three perpendicular wires sufficient for a Langstroth frame, if the sheet of foundation is fastened securely to top and ends of the frame. The small tinned wires do not interfere at all with brood-rearing; and while three wires properly spaced will hold the foundation in line and secure nice straight combs, a greater number of wires will obviate the necessity of fastening the foundation to the ends of the frame, and will also enable the combs to stand rougher handling without damage.

The small tinned wires are preferable to larger wires, for the reason that they can be stretched tight without springing the thin bottom-bars of frames much out of line. Now, while wires are to be preferred for brood-frames, wood stays do very well for frames which are to be used exclusively for the extractor. The wood stays which I have used were sawed  $\frac{1}{2}$  square. Holes were drilled in top and bottom bars with a  $\frac{1}{8}$  bit, and the stays pushed up through the bottom-bars, and nailed in both top and bottom bars of frames. Three of these perpendicular wood-stays were used in frames the length of the Langstroth; and about 300 such frames which have been in use during the last 15 years have proven entirely satisfactory. When wood stays are put in and nailed, the thin bottom-bars are held perfectly straight and true; and after the comb is built down and attached to the bottom-bars there is little or no danger of the comb filled with honey bulging out of place if the frame should be turned over sidewise.

But wood stays, with me, have proven entirely and invariably *unsatisfactory* when used in brood-frames. The trouble seems to be that my bees entertain decided views on the matter. If a frame of foundation with wood stays were placed in the brood-chamber when honey was plentiful, the foundation would probably be built out into a nice even comb; but so soon as the bees were at leisure they were pretty certain to cut more or less of the comb away from

the wood stays and then cut away more or less of the wood stays. Of probably 50 frames of that kind which I tried as an experiment, I think that not one comb remained in good condition in two years. Better not invest in a large number of wood stays for the brood-chamber until you consult your bees and learn their views on the matter.

East Springfield, O.

### BEE-KEEPING IN SOUTH AFRICA.

60-CENT COMB HONEY DROPPING TO 36 CTS.; AN INTERESTING LETTER IN REGARD TO HIGH-PRICED HONEY IN AFRICA.

By *Francis J. Haarhoff.*

Some time ago I sent you a short article on bee-keeping in South Africa, in which I stated that we sell honey here at 60 cents per 1-lb. section. Although I spoke the truth at the time, I am sorry now that I did it, as I am afraid I have unwittingly given a wrong impression, as appears from some half-dozen letters which I have since received from your country inquiring for particulars and prospects of success for intending immigrant bee-farmers.

The case is this way: Last season the competition was between myself and one or two other small bee-keepers who did not own fifty colonies between us; consequently there was no fear of a glutted market. And, moreover, honey in sections was something new to most people, and was bought by many as a curiosity, or as something to be looked at for its beauty rather than tasted for its sweets. This season several new competitors have already appeared in the field; and our market being limited to Pretoria and Johannesburg, the result is that the price of 1-lb. sections took a straight drop from 60 cents to 36; and I expect before the season is over to see it down to 24 cts. or under; and any oversupply would soon make the article a drug in the market. Then, again, for the information of intending immigrants I must state that the cost of production is abnormally high, as every article used in the industry is imported from America. I may state that every hive, section, or sheet of foundation, or any thing else I use in my small apiary, has been ordered for me by Messrs. T. W. Beckett & Co., from the A. I. Root Co.

Then, again, as to pasture. We have a long summer and short winter. But it must be borne in mind that nature supplies little or no pasture for bees, as our pastures are all pure grass—no clover, basswood, or honey-producing wild flowers, all our honey being mostly obtained from cultivated gardens, thus precluding the bee-farmer from keeping too many colonies. The only honey-producing wild flowers are a variety of milk-bush, which grows only on old and deserted land or gardens. These are being fast exterminated.

I have written this lengthy letter to correct any mistaken impression I may have created. Pretoria is not all roses. There are many thorns.

Pretoria, South African Republic.

### ANCIENT LEGENDS REGARDING BEES.

ABILITY OF BEES TO DISTINGUISH BETWEEN GENUINE AND ARTIFICIAL FLOWERS; AN INTERESTING ARTICLE.

By *T. S. Ford.*

In the Sunday-school quarterly sent out by the M. E. Church South, and in Peloubet's notes on the International Sunday-school Lessons for 1896, an example is quoted to illustrate the wisdom of Solomon, as follows: "When the queen of Sheba placed two wreaths before the monarch, and asked him to tell which was real and which was artificial, he opened a window; and a bee alighting upon the natural wreath told him what he wished to know." Peloubet quotes this story from Gelkie and Farrar, and Stanley's History of the Jewish Church. It is supposed that these authors got the story from some rabbinical compilation, and it really shows how easy it is to get away from the open book of nature. A Greek historian would never have invented such a story; and if he had found it he would have rejected it at once. The truth is, if Solomon was the close observer that he must have been he would never have permitted an appeal from the verdict of his own senses to those of an insect.

The writer was sitting one day last summer by an open window. A hand-painted fire-screen of enameled cloth hid the fireplace, and upon it was painted in water-colors, upon a dark background, some water-lilies rather clumsily executed, and some passion-flowers (May-pops) which were quite life-like. The whole vine was shown with flowers and fruit hanging. An enormous bumble-bee came buzzing in at the window, and made straight for the painted flower, and clung to it, extending his tongue in a frantic endeavor to get at the supposed nectar. He persisted in his efforts for at least twenty seconds—long enough to call the attention of other members of the family to the scene. Finally he gave it up, and flew straight out of the window, apparently without ever realizing how he had been cheated.

In a contest between two ancient Greek painters, as related in Rollin's Ancient History, grapes were painted so naturally that the birds came and pecked at them; and another great artist painted a mare so artfully as to cause a horse, when led up to it, to whinny. Now, the senses of a bird or animal, reinforced as they are with a higher degree of intelligence, were thus cheated.

In the crest of the king-bird or bee-martin are hidden, under a dark exterior, a cluster of

scarlet feathers which show beautifully when the crest is erected. The current belief among our common people is that this semblance of a scarlet flower on the top of a bee-bird's head attracts the unwary bee to the jaws of the hungry bird; and I have myself seen bees swerve from their line of flight and circle round the sitting bird until snapped up.

It is said that Solomon "spake of trees, from the cedar-tree that is in Lebanon, even unto the hyssop that springeth out of the wall; he spake also of beasts and of fowl, and of creeping things" (insects) "and of fishes." In other words, this great man, who probably had no access to works on entomology and natural history, as do we, was a close observer of all the phenomena of animal and insect life, as he saw them. To say that such a man, gifted above all men who lived before or since in all the faculties of observation as well as reasoning, and therefore a closer observer than Darwin himself, should have been so silly as not to know that any gay color, having the semblance of a flower, will attract a bee, is a striking illustration of why it was that He of whom he himself said, "A greater than Solomon is here," treated with contempt "the tradition of the elders." This story of Solomon's artifice of using the bee to aid him in detecting the artificial from the natural flowers is evidently one of the monkish inventions of the ancient Jewish rabbis, living as far from the real truths of nature as they did from the truth of the Spirit, and who erected a hideous system of ethics, false to the real teachings of the Angel of the Covenant.

The rabbi who, in ancient times, coined the false story of Solomon and the honey-bee, thereby imputing to the insect more acute power of observation than the wisest of men, found his counterpart in a Methodist bishop whom the writer heard in the pulpit on a great occasion, enlarging upon the wonderful faculties which the Creator had bestowed upon the honey-bee. He said the senses of the insect were so acute, and that they were always so sensitive to the approach of rain, that the last individual of the busy hive was always safely housed before the storm began. The idea clothed in his beautiful language (which I can not undertake to quote) was very impressive; but, as every bee-keeper knows, he was far from the truth. Last summer a thunderstorm came up in the middle of the day. There was a furious wind accompanying the first dash of rain; and while probably the great majority of the busy workers reached the hive before the bursting of the tempest, thousands were seen so buffeted by the wind and rain that they took refuge in the shrubbery, many yards from the hives. The writer thinks that the Jewish legends of the several incidents attending the visit of the Sabæan queen are squarely on a

level with the Arabian stories of his dealings with the genii, and that neither is worthy of quotation in the Christian's study of the Scriptures.

Columbia, Miss., Nov. 29.

[When I saw that item in Peloubet's Notes regarding the manner in which Solomon is said to have distinguished between the real and artificial wreath, I said to myself, "The story is very pretty but improbable." A number of the other things that the queen of Sheba is said to have placed before King Solomon, while ingenious are equally improbable. I am surprised that Dr. Peloubet places so many such things in his "Notes," that are studied and admired by Sunday-school workers everywhere. It is this same Dr. Peloubet who, by way of illustration, spoke of the skill of man in manufacturing honey-comb, filling it with glucose, and capping it over with appropriate machinery. The illustration itself, I remember, was very appropriate, but the thing itself very wide of the truth.

I never supposed myself that it was possible to fool even a bumble-bee with artificial flowers, much less those that are painted.

I have seen bees follow bee-martins and king-birds in their flight through the apiary; and I have seen them circle around the birds after they had alighted; but I always supposed this was owing solely to the fact that they were enraged by seeing a swiftly moving object among them. You know it is a great deal safer to walk through an apiary quietly than to run through. One of the first things I ever learned in bee-keeping, in my early boyhood days, was that, if I ran through the apiary to escape the bees, I was more apt to be stung than if I walked through quietly.—ED.]

## EXPERIMENTS IN FEEDING BEES.†

### HOW TO FEED IN THE BOTTOM-BOARDS.

*By F. A. Snell.*

During my 36 years of bee-keeping in this State I have tried many different ways of doing it. I first kept my bees in box hives, and those short of stores were put in the cellar during winter. The hives were inverted, and the bees were fed by placing combs of honey over the tops of the brood-combs, with food enough to carry them through till spring, as advised in Quinby's *Mysteries of Bee-keeping*.

Later I transferred all my bees into movable-comb hives. A few being short of stores the first year, I placed them in the cellar, and two or three were fed on sorghum molasses as advised by some writer. These all died before spring, as well they might have done. The rest were fed on granulated-sugar candy to supplement their stores. These came out in the spring in very good shape. Good seasons followed, and I quit trying rapid increase, and my bees were well supplied with food for winter. I was quick to adopt the honey-extractor when it came before bee-keepers, and ran a part of my bees for extracted honey. Then the honey was taken from the brood-chamber. During the early bloom I kept the combs emptied of honey by its removal once a week.

After the early bloom a drouth set in, and the fall bloom was almost a failure, and, as a result, my bees were short of stores for winter, and I was forced to feed, and tried various ways of doing it. I tried shallow dishes filled with honey. Sticks were laid across to keep the bees from drowning; deeper vessels were tried, also cans filled with honey inverted over plates, and slightly raised, and held in place by small sticks which held the can in place, allowing the feed to flow over the plates from which it was taken by the bees, and stored in their combs. These feeders were all placed over the brood frames, and the heat from the bees retained so far as possible by covering the feeders with pieces of carpets. Later on I experimented with other methods of feeding—not from necessity, but to gain knowledge.

At a meeting of the old Northwestern Beekeepers' Association held at Decatur, this State, in October, 1869, I learned from that veteran bee-keeper, James M. Marvin, his method of feeding. To feed he simply raised the fronts of the hives two or three inches higher than was the rear, and poured the feed in at the entrance, giving about two or three quarts of feed at a time, and doing so just at night, so no robbing would occur; and by morning the feed would be all stored in the brood-combs. This was new to me, and was tried by me at the first opportunity. I found it worked well. The honey or syrup was fed warm, and should be made a little thinner than honey. Fed thus, no bees were drowned. The object was to give the bees a good supply of food for winter, and to do so in as short a time as possible; hence the feeding was done each evening until all had enough to carry them through to spring. This way of feeding for winter is very little trouble. No extra fixings had to be made, and later to take up valuable room. From time to time since, this method has been mentioned in our bee-journals. It is old, but none the less valuable; and where bees have been drowned by so feeding, I believe it was from the feed being given cold and too thick. It should by all means be quite warm, and thinner than ripened honey when given. Very likely those veterans, M. M. Baldrige and R. R. Murphy, fed their bees in this way away back in the sixties. I wish we might hear from them often through our bee-journals.

When entrance feeding is practiced, care should be taken that, in case of rain, no water can enter the hive. The hives must be sealed fast to the bottoms, so no food can leak out and be lost, and induce robbing, perhaps. Late years I have had no occasion to feed for winter, but have experimented during spring with a view to increase brood-rearing or to learn whether such feeding was advisable. I have tried entrance feeders; and for inside, Hill's, Root's, sack, pepper-box, etc., and one of my

own get-up. I now prefer the J. A. Golden. I am now confident that early spring feeding to try to encourage brood rearing is no benefit, but detrimental. If such is of value at any time, I think it is between fruit and white-clover bloom; but I do not know. So far as my experience goes, after all this time I believe that, if the brood chamber is kept well supplied with honey in the brood-combs, other supplies given as by feeders are of no use. I shall continue to experiment along this line on a small scale in the future, as I have done in the past, and hope to gain more light by so doing.

Milledgeville, Ill.

### BISULPHIDE OF CARBON.

HAS ITS VALUE AS A MOTH-KILLER BEEN OVER-ESTIMATED? ITS BAD EFFECTS ON COMB HONEY; AN IMPORTANT AND VALUABLE ARTICLE.

By C. Davenport.

In reading the report of the last convention proceedings of the North American Bee-keepers' Association I notice that bisulphide of carbon is mentioned as a means of killing moths in comb honey. I should like to say a few words about this; for I believe that, if it ever comes into general use for this purpose, it will do more to injure bee-keepers than adulteration ever has or ever will, for adulteration affects extracted honey only. While I believe comb honey represents the largest interests, I do not wish it to be understood that I am not aware of the great harm adulteration has done and is doing to the producers of honey. I most heartily approve of what the members of the association at the last meeting said against and are trying to do to remedy the evil.

As a means of killing moths in comb honey I have experimented with a good many kinds of drugs. While there are a number of kinds that will kill the moths under the right conditions, all that I have tried as yet, which were effective, injured the flavor of the honey, and bisulphide of carbon did so the worst of all. It also has the peculiar property of making it thinner—not only what is in unsealed cells next to the edge, but that which is sealed as well.

Sections of honey that are so well cured that the honey in unsealed cells can not be shaken out by hand will, soon after treatment with bisulphide of carbon, run or drip quite readily from unsealed cells if the sections are turned over on their sides; and the honey in some that I kept a number of months after treatment did not get thick again. But it should be understood that the treatment was very thorough, as it has to be in order to kill the moths. I hardly think any room could be made tight enough for this purpose unless it is one well plastered, and strips of paper pasted over all the cracks

around doors and windows; and the floor would have to be especially good, for the gas or fumes from this stuff try to go down instead of up. I tried it first in a room which I thought was nearly air-tight; but after eight hours, moths in some old pieces of comb which had been placed in the room were as lively as ever. In this case the drug was placed in a large open dish about seven inches in diameter, and it was not all evaporated when the room was opened. I then took a good sound bee-hive, nailed on a tight bottom, and poured melted beeswax around all cracks; in fact, I coated it all over inside with wax, as I did the cover, which was one that fitted very tight. Along the top edges of the hive, on which the cover would rest, strips of rubber were nailed so that, when the cover was on and heavily weighted down, this box was, I believe, perfectly air-tight; and I found that in this box it took about  $3\frac{1}{2}$  or 4 hours to kill moths that were well protected by the comb and their web. Those I took from the comb and placed in an open glass would die in about  $1\frac{1}{2}$  to 2 hours.

In order to kill moths in comb honey it would, of course, have to be left as long as it took to kill those protected by their web and the comb. Moths are much harder to kill in this manner than some things that are larger. A mouse in a trap was put in this box, and at the end of 20 minutes the cover was removed and the mouse was dead. It took but a few minutes to kill a toad and a gopher.

In killing moths with the fumes of sulphur it is much easier to kill the small ones. With bisulphide of carbon the big ones seem to die fully as soon as the small ones.

Moths are very bad here during warm weather. Some one said that, with Italian bees, if the honey were taken directly from the hives and put in a room tight enough so that a moth-miller could not enter, the honey would not be troubled by moths. But I am sorry to say that, in this locality, honey directly from the hives of Italian bees put in such a room, if the room is above ground, and kept as warm as it should be, would often be nearly destroyed by moths if it were not sulphured every twelve days or so for a while during warm weather.

I should like some better method of killing moths than sulphur, but I do not believe it is to be found in bisulphide of carbon; for, to say nothing about its injuring the honey, it is fully as much (if not more) work to use it. It costs more, and, besides, it is a poisonous and dangerous drug to handle.

□ Southern Minnesota, Dec. 1.

[I am glad that Mr. Davenport has sounded a note of warning in time, for of late bee-keepers have been looking toward bisulphide of carbon as the best solution of the moth evil in comb honey; but if the remedy is as bad as or worse than the disease itself, then it is high time we called at least a temporary halt. It is no doubt true that other bee-keepers who have

tested bisulphide of carbon are in a position to prove or disprove Mr. Davenport's statements; but we have learned by experience that he is one of those careful, thoughtful, painstaking bee-keepers whose opinions should be regarded as having considerable weight.

Prior to the use of bisulphide of carbon, sulphur or brimstone had been used, and no bad results, I believe, have ever followed, except in cases where too great a smudge was made—much more than was necessary. It is then that a yellow deposit will be found on the sections and the surface of the honey. This is no real detriment to the flavor of the honey, but it does affect quite materially its appearance for the market, and that is a real damage.—Ed.]

### THAT RAPID BEE-ESCAPE.

By C. H. Dibbern.

I think a little explanation is necessary in regard to the escape described in GLEANINGS of Nov. 15. Up to the time I wrote the article I had experimented with various designs, on the lines indicated, with some very gratifying results; but as the past few seasons have been practical failures I had little chance to put it to actual test. When I read about the multiple-exit escape my thoughts reverted to my experiments with this pattern, and I again made some trials, the results of which seemed to warrant the article I sent you. Since then, however, I have taken off a good many full cases of comb honey, and the design as published has proven a disappointment.

The Porters are entirely right in claiming that bees must first have a strong desire to leave the supers before they will do so. It seems that, in the board described, there was too much connection with the hive; and while, sometimes, it works very well, at other times it has failed entirely. Then, too, I found that, with only two exits, it worked all right, and I am not sure but one exit would be better yet. Then, too, I found that four or five lines of obstructions across the board are better, and it can be greatly simplified. I now use a piece of perforated tin  $\frac{3}{4}$  in. wide, and as long as the board is wide. Get your tinner to turn up  $\frac{3}{8}$  square, and with a common jack-knife cut the tin so you can bend little openings for the bees to pass through outward. Nail four or five of these strips across the board, with the openings fronting to the exits. Nothing more is necessary.

For extracting purposes I believe this plan of getting rid of the bees rapidly offers great possibilities. If a tin slide is arranged to cut the bees off from the hive entirely for fifteen or twenty minutes it will greatly hasten the bees in leaving. This slide can be put over the lower holes, and there will be no danger of smothering the bees, as they can get plenty of air through the perforated strip at lower end of board. It is not intended to nail upper and lower boards together, but can be used for hive

or case-covers by covering the holes till wanted as bee-escapes.

The Porter escape is a very ingenious little invention, and I think the main reason of its success is the fact that it leaves but a very small connection between hive and super. I have produced several escapes that work just as certainly and quickly as the spring escape; but it has been my ambition to produce an escape that will work more rapidly, and with less danger to the bees, and I believe I am in a fair way to accomplish it. If some one else (as the Porters did my original plan) takes up my ideas, and by more ingenuity succeeds, well and good. Bee-keepers will be the gainers as they now are in the Porter escape. Another year I shall experiment further, and make competitive tests, and perhaps in due time have something further to say in GLEANINGS.

Milan, Ill.

#### YELLOW-JACKETS, MICE, ETC.

A correspondent from the South propounds a few questions relative to the apiary, which I will answer under the headings below.

##### YELLOW-JACKETS.

He says he has recently discovered yellow-jackets in some of his hives, evidently stealing honey. He thinks the bees have killed some of the jackets, but is not sure the jackets do not kill some of the bees, and asks if there is any remedy.

If the correspondent has really seen yellow-jackets on the combs, among the bees, eating honey, when the bees were in a normal condition, he has seen something I never saw. Yellow-jackets are very fond of honey; and when it is exposed, by opening hives, etc., they will dive on to the combs and eat it ravenously; but so far as I have been able to discover, when the hives are not molested by the bee-keeper, the bees do not allow them to go on the combs of honey. They annoy the bees to a certain extent; but bees, here at the North, seem to be equal to repelling all attacks from them, so that the apiarist pays little or no attention to them. If they really do enter the hives, as the language of the correspondent would denote, or kill many bees, so that a remedy should be sought, I would suggest destroying their nests or killing them with poisoned honey. If the latter is used it should be kept in a dish covered with wire cloth, the mesh of which will admit the jackets but exclude the bees, else the bees would get poisoned as well as the jackets.

##### MICE.

He next asks: "Do mice ever trouble bees? If so, what is the best way to get rid of them?"

Here at the North mice are often troublesome to the apiarist in winter, inasmuch as they disturb the bees by their constant motion, and gnaw holes in the combs, where left unprotected by the bees, the cluster of which is contracted to the smallest proportions to withstand our cold weather. Mice never trouble when the bees are in the active state, for the bees sting them to death very quickly, and for this reason I should not think they would trouble in the far South, for bees can fly there the most of the time, I suppose. Our remedy here is to trap them in our bee-cellars and fix entrances of metal to the hives which are wintered outdoors, so small that the mice can not get in, while the bees readily pass through. Tin and sheet iron are the materials generally used for this purpose.

#### SIZE OF SECTIONS.

Again, he wants to know what size of honey-frame is best where it is desirable to sell comb honey. By which is meant, I suppose, what are termed "section boxes." If he means what size of frame is best to use while working for comb honey, then I would answer, the Langstroth, for the South. But the question (though not quite plain) evidently means sections, by the term "honey-frame," so I will answer on that supposition.

There are, in quite general use, sections varying in size from half a pound to two pounds, when filled with honey. Each size has its advocates, but probably there are two to one of what are termed the  $4\frac{1}{4} \times 4\frac{1}{2}$  sections (which hold about a pound of honey), when taking all sizes of sections into consideration. This section was mainly 2 in. wide when first brought before the public, but lately many use them of less width, or thickness. This section was made of this size because 8 of them would just fill the Langstroth frame. My own preference is a section  $3\frac{1}{2} \times 5\frac{1}{4} \times 1\frac{1}{2}$  in., this holding a pound as nearly as may be when well filled. This size is used in single-tier wide frames with separators, so as to secure each comb built perfectly in the box. My reasons for preferring them are, that more in number can be set over a given space than can those of less depth; besides, such a cake of honey is of symmetrical proportions, and pleasing to the eye, it being just sufficient to set on the table for an ordinary family, and, covering more surface, apparently, to look at, does not give a scrimped appearance or pattern. Why I prefer them to the larger size is that they bring from two to three cents per pound more in market. If it is desired not to use separators, a thinner section can be used. The advocates of no separators use seven or eight sections to the foot, of the  $4\frac{1}{4} \times 4\frac{1}{2}$ . However, the non-separator plan, as a rule, does not give as nice and uniform combs as does the other. For this reason many grocers object to "non-separated" honey, as the combs get more

or less injured in transit, so that daubing and leaking on counters, etc., is the result.

#### LOSS OF QUEEN.

Lastly he asks: "In case the colony should lose the queen, what would be the result? I find some empty cells in some of my hives, and thought perhaps the queen had died."

If a queen is lost, or dies, when there are eggs or larvæ in the hive, the bees have the means at hand for the rearing of another; for by feeding any worker larva, under four days old, royal jelly, and enlarging the cell, it is changed from a worker into a queen. A colony in this condition is not called "queenless," but yet it is without a "laying queen." By the time this young queen hatches, all of the eggs and larvæ have passed into the pupa state, when it is impossible for the bees to rear another, should this young queen become lost before she gets to laying, in which case the colony would be hopelessly queenless, and must perish with the death of the bees by old age, unless assisted by the apiarist in giving them a queen or larva from which to rear another. The finding of empty cells does not indicate queenlessness, for there are more or less empty cells in the hive at all times, and during fall and winter little or no brood is found. If during the busy season of the year, no brood of any kind is found, the colony may, as a rule, be considered queenless.

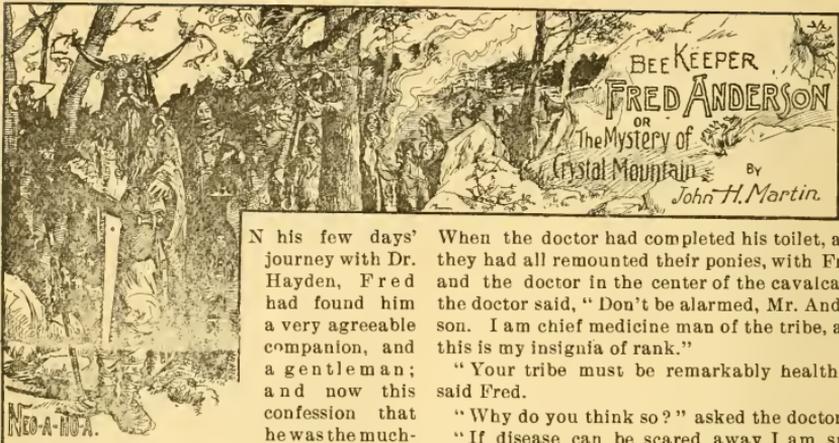

[The following, from Mr. F. A. Salisbury, an other bee-keeper living in the same county with Mr. Doolittle, after having tried the tall section favors the square one. Here is what he says:—Ed.]

#### A SERIOUS OBJECTION TO TALL SECTIONS.

Mr. Root:—In your editorial in Dec. 15 GLEANINGS, in regard to oblong sections, I want to say that I have used them for three or four years, and am getting back to the square, on account of foundation, when being drawn out by the bees, is, in too many instances, fastened to the separators. The sections are  $3\frac{1}{2} \times 5\frac{1}{4} \times 1\frac{1}{2}$ . Now you will see that, on account of the height and narrowness of the section, the foundation, if bees work on one side a little more than on the other, will be swung over so as to strike the separator a great deal sooner than if the section were only  $4\frac{1}{4}$  high. On this account I am changing over to the regular  $4\frac{1}{4}$  section. I think that honey in oblong sections looks a little better than in square sections; but there is too much of fastening of foundation to suit me.

The article you publish, taken from the *Progressive Bee-keeper*, hits the nail. F. A. SALISBURY.  
Syracuse, N. Y., Dec. 19, 1896.

[Mr. Salisbury's difficulty, if the same should be experienced by other bee-keepers, will be a somewhat serious one. But it seems to me the tendency of the starter to lean over to one side can be overcome by side fastenings; but Capt. Hetherington, and a large number of other York State bee-keepers, are using tall sections quite extensively. Mr. Danzenbaker never spoke of any trouble in the line hinted at by Mr. Salisbury, and he fastens starters at the top only. And those who are using the old square sections, and have thought there might be an advantage in change, are very anxious to know whether others have had the same trouble. How many shall we hear from now, both for and against tall sections? Let us have the truth, cut where it may. This is an important matter and I hope we shall hear from many.—Ed.]

N his few days' journey with Dr. Hayden, Fred had found him a very agreeable companion, and a gentleman; and now this confession that he was the much-talked-of bad

man of Crystal Mountain gave him such a shock that he reeled a little in his saddle.

The doctor, seeing his agitation, said, "I trust, Mr. Anderson, that in the few days of our acquaintance I have impressed you with the fact that I possess, at the least, a passable character, and I trust that you can discriminate between character and reputation. Reputation is what other people say of us. If they have received false impressions of me, and even enlarged upon them, and have sent them broadcast through the papers, it affects only my reputation, while my character, to those who know me, is brighter from the contrast. Now, as I told you at the commencement of our journey, if you have any doubts, or if you think I will not live up to my agreements, you can return to Sacramento at my expense. Give the matter careful thought, and give me your final answer when we reach yonder clump of live-oak trees, an hour's journey ahead; for when beyond that point you will not be allowed to return until the expiration of our agreement."

Fred answered not a word; but for the next hour his thoughts were busy. Doubts, one after the other, were thrown aside; and as he cast them away his spirits became more buoyant; and when the party passed under the live-oaks he reined in his horse and clasped hands with his employer, and said, "Dr. Hayden, I will trust you."

"You decide wisely," said the doctor.

Under the oaks they were met by a score of mounted Indians from the rancheria. They all dismounted, and formed in a circle with the doctor in the center. A peculiar leathern box was passed several times around the circle, and at length passed to the doctor. The latter opened the box and removed therefrom, and proceeded to bedeck himself with, the most grotesque outfit Fred had ever laid eyes upon.

When the doctor had completed his toilet, and they had all remounted their ponies, with Fred and the doctor in the center of the cavalcade, the doctor said, "Don't be alarmed, Mr. Anderson. I am chief medicine man of the tribe, and this is my insignia of rank."

"Your tribe must be remarkably healthy," said Fred.

"Why do you think so?" asked the doctor.

"If disease can be scared away I am sure your habiliments will do it. My heart even throbs now at the sight of you."

"Yes, yes; I understand," said the doctor. "Your disease, then, must be of the heart. Well, we will see if the things about Crystal Mountain will not prove a cure-all for you."

Upon arrival at the rancheria the whole cavalcade entered a sort of plaza that was well surrounded by circular houses; old men, squaws, papposes, and dogs seemed to spring out of the ground on every side. The horsemen circled around the plaza several times, keeping up a monotonous chant. The doctor, now Neo-ah-o-a, or medicine man, kept time by rattling a gourd, and at regular intervals giving it a tremendous whirl over the teeth of a saw-fish, which was a part of his regalia. His head-dress of long steer horns had obsidian rattles at the tips that glistened in the sun, and also kept up a rhythmic tinkle with every movement. At the conclusion of the chant, the bundles from the pack-ponies were deposited with the doctor, and, with the aid of the chief, the various articles, useful and ornamental, that had been purchased in Sacramento, were distributed to the various parties for whom they were purchased.

At the completion of the distribution our medicine man, with Fred and two of his immediate helpers, retired to his own tent-like structure. Here he discarded his outlandish dress, and said to Fred, "You see that we live in a rather primitive way here. This portion of the rancheria that I occupy is like all of the rest, except in size; the ground is our floor; our fire is made in the center, and the smoke escapes through the hole in the roof. The Indians roll up in their blankets and sleep in the surrounding space; but I have cots, as you see, and you can occupy the one in yonder nook."

"But, doctor, I can not imagine how you, the only white man here, could obtain the confi-

dence of these Indians and become their medicine man."

"That was a very simple matter," replied the doctor, "and it all happened through a swarm of bees. For several years my travels have led me among the different tribes of Indians all up and down this coast; and in many of them I find the snake recognized as a symbol for either good or evil in their religious rites. When I came here a few years ago I was surprised to find this tribe having traditions much like the Moquis of Arizona, and, like the Moquis, they had a snake-dance. I had learned the Moqui language, and found it easy to converse with these people, whose language was similar; and, being a physician, I affiliated as far as possible with the medicine men. With this tribe, in-

Neo-a-ho-a made a valiant defense; but as bees were unknown in this portion of the State up to that time, he was fighting an unknown enemy at a great disadvantage. The whole rancheria was aroused; but every one who ran to the aid of Neo-a-ho-a ran back howling with half a dozen bees on his or her face or hair. For a short time it looked as though there would be a complete stampede of all of the occupants of the rancheria.

"I had been a manager of bees in the East, and, taking in the situation as soon as I heard the commotion, I made a smudge, and, taking a large blanket, I brought the medicine man to a place of safety in the center of one of the large huts. I saw at a glance that the poor fellow could not live. My remedies were few,

The burial of Neoahoa. The New Neoahoa.

R. J. TURPIN, CIV. D.

stead of courting the favors of a venomous reptile, as did the Moquis, they performed their rites with the harmless gopher snake, and for this purpose kept half a dozen in as many different stone cages in the cliff near the rancheria; and at planting-time their rites required them to be all huddled into one cage or small cave. A few days after my arrival, while the medicine man Neo-a-ho-a was performing some rite over the snakes, with sweet-smelling herbs, an immense swarm of bees settled upon the entrance to the little cave where the snakes were kept. As a result, the new comers took possession, and, being no respecters of persons or snakes, even if the latter were pampered as divinities, there were in short order six dead snakes.

simple, and ineffective. I called the chief and old men into the hut, and informed them of the fact; and while I was bent low chafing the poor fellow's body, in the throes of his last gasp for life, he threw his regalia over me, exclaiming, 'Neo-a-ho-a,' which meant that I would be his successor; and while I was all the time fearing that these simple people would lay all of the untoward circumstances to the presence of a white man, strange to say I was accepted by the head men of the tribe without a murmur of dissent. 'There is a providence that shapes our ends, rough hew them as we may.' I exclaimed, as I arose with my new insignia of office upon my shoulder. After many years' wandering after a beloved object that had

eluded my search it seemed to come to me like a flood of light from above that, if I would take the place of the Neo-a-ho-a and wait here, the object would come to me, and for many years I have waited. Of this world's goods I had plenty, and now as medicine man I would try to lead the whole tribe up to such a moral height as their natures and surroundings would permit. The moment was ripe for a change. I had but to put in my sickle, and reap.

"After much ceremony in removing the sacred snakes from the little bee-cave, and burying them with Neo-a-ho-a, I found that, in substituting a swarm of bees as an object of worship, I had an excellent foundation from which to lead up to Christianity. Here in this little insect-community I found industry, cleanliness, love, fidelity, order, providence, alertness, patriotism. The fathers of the tribe were slow to give up their old traditions; and to please them I still wear the regalia; but to the younger members of the tribe I have thoroughly inculcated Christianity. How I have succeeded you have in part seen at Sacramento, where their conduct was far better than that of many of their white brothers; and as the weeks roll by you will learn much more."

"And you are the bad man of Crystal Mountain!" said Fred.

"I am the bad man of Crystal Mountain," replied the doctor, with a sad smile.

"In the matter of good morals and good works, doctor, you remind me of my good friend Prof. Buell."

"Certainly he is a kindred spirit; for whenever you mention his name my heart warms toward him. I believe you said he had an invalid daughter. What was the nature of her disease?"

Fred hesitated a moment for a reply, and, with an evident effort, he said, "Doctor, she is insane."

"Sure, sure, that is grievously unfortunate; and, Fred, what is the young lady's given name?"

"Her name is one among thousands; it is Alfaretta."

"Alfaretta! did you say Alfaretta?" shouted the doctor, springing from a recumbent position in his easy-chair. "Alfaretta, did you say?" grasping Fred by the shoulder.

"I certainly said so," replied Fred, with evident alarm; "her name is Alfaretta Buell."

"Strange—strange!" said the doctor; "and that name *Buell* comes up every time. If it were Bull, plain Bull, I believe the mystery would be solved."

Then the doctor walked back and forth across the room with head bowed. At length he stopped suddenly, and said:

"Fred Anderson, did you ever hear the name of Adrietta mentioned by the Buells?"

"I never did," replied Fred.

"Let me tell you, Fred Anderson" —

Here the doctor was interrupted by the rattling of gourds without, and, hastily donning his regalia, he said, "Surely I had forgotten

A PRISONER

our evening council. As this council pertains to your advancement, Mr. Anderson, you will have to remain here. My helpers will bring you your supper, then you can rest; and do not be surprised if I tell you that we start for the bee-ranch at midnight."

"After the last few days' experience I will try to allow nothing to surprise me," replied Fred.

"Good! good!" said the doctor, with unusual warmth as he grasped Fred's hand, and then immediately left the tent.

Fred, not being fully recovered from his recent illness, sought his couch early; but for a long time he lay awake speculating upon the episodes of the afternoon, and especially upon

the effect the name *Alfaretta* had upon the doctor. Sleep at last came to the tired body; but in the mind it was dreams, dreams, one after another.

It must have been near midnight when he was sporting with *Alfaretta* and the mermaids, and then with Matt Hogan, as on the night of the tempest, gliding swiftly down the river. The motion seemed so real that he awoke with a start, and then a struggle. He was securely bound to his cot, and was being borne rapidly along by several dusky persons. In the darkness he could not distinguish that any of them were his former traveling companions, and in utter desperation he shouted, "Dr. Hayden! help! help!" The night air fell cool upon his face, but not a reply came to his appeal save the dogged trot of the Indians. Fred was now fully aroused; but finding that neither struggles nor shouts made any impression upon his captors he submitted through sheer exhaustion. When one set of carriers tired, another set relieved them, and the trot, trot, continued. It seemed an age to Fred before his cot was halted and set down. His bands were here loosened, and he was motioned to arise. He noted that the Indians around him were not the same that he had seen in the rancheria, and the stopping-place was where many huge boulders reared their ungainly forms; and near one of them was what appeared to be a long low adobe cabin; near it a few Indians were kindling a fire. Fred had no more than taken in this situation than he was closely held by two of the Indians, his arms pinioned, and a tight bandage placed over his eyes.

I WOULD call special attention to the article by Mr. Davenport, in this issue, regarding the danger arising from the use of bisulphide of carbon in destroying moths in comb honey.

In this issue, under "Ridgepole Musings," R. C. Aiken gives some interesting and valuable facts about alfalfa. Much of what he says regarding this famous honey-plant will be new to many.

THE EDITOR OF THE BRITISH BEE JOURNAL IN CALIFORNIA.

THE editor of the *British Bee Journal*, Thos. Wm. Cowan, whose name I have often mentioned in these columns, has been making a hurried tour across our great and beautiful country. I knew that he was expecting to make the trip, but he was surprised to receive a letter from him so soon, not from "Merrie England," but from our beautiful State of California. Here is the letter, which I have taken the liberty to give our readers:

*Dear Mr. Root:*—I am pleased to say that Mrs. Cowan and I arrived here after a very pleasant journey via the Sunset Limited, and were much interested in all we saw by the way. I am very glad we came by that route, for we found it very cold in New York, and I am afraid we should have found the northern route rather unpleasant at this time of the year. I shall hope in the spring or early summer to travel by that route and stop off to see some of my bee-keeping and other friends. I see GLEANINGS of Dec. 1, and observe that you have made a very good copy of the illustrations of my pamphlet on "Foul Brood." I also notice that Mr. A. I. Root has gone to Arizona, and I shall look forward with interest to his account of what he sees. I should have liked to stop some days there to study the cacti, and to have collected specimens, but I hope to do so some other time. THOS. WM. COWAN.

Loomis, Cal., Dec. 21.

Mr. Cowan is without doubt, the most distinguished bee-keeper from abroad who has ever visited our country. Indeed, for scholarly and scientific attainments I doubt if he has an equal among those who love and study bees. Bee-keepers all over this broad land will be glad to extend him a warm welcome.

#### THE LINCOLN CONVENTION GROUP.

I HAD hoped to get the group picture of the Lincoln convention, shown on page 11 of this issue, long before this; but I have been waiting to get the names, in answer to request, corresponding to the numbers; but so far they have failed to come to hand. I can give a few of them from memory; but as I find Mr. York, in the *Am. Bee Journal*, gives a larger list than I can recall, I copy his list entire.

- |                           |                        |
|---------------------------|------------------------|

| 8. E. B. Gladish.         | 30. H. E. Heath.       |
| 9. Ernest R. Root.        | 31. Mrs. E. T. Abbott. |
| 10. George W. York.       | 32. S. H. Herrick.     |
| 12. Dr. A. B. Mason.      | 34. J. C. Stewart.     |
| 13. Rev. E. T. Abbott.    | 37. J. C. Masters.     |
| 14. Mrs. Eugene Secor.    | 38. E. Kretschmer.     |
| 15. Hon. Eugene Secor.    | 40. W. C. Frazier.     |
| 16. J. C. Knoll.          | 41. Rev. Clay C. Cox.  |
| 17. A. Laing.             | 43. Mrs. E. Whitcomb.  |
| 18. Dr. C. C. Miller.     | 53. Charles White.     |
| 20. Mrs. Compton.         | 54. M. A. Enslow.      |
|                           | 57. L. M. Brown.       |

At the close of one of the sessions we assembled on the steps of one of the college buildings (the Library Hall, I believe), and one of the members of the Lincoln meeting, a Mr. Lovell, professional photographer of Omaha, Neb., as well as a bee-keeper, made the "shot."

Many of the faces bring back to me pleasant memories, and I should like to give some of the little incidents, chats, and handshakes called forth by many of the faces, some whose names I can't even now recall; but space, and the fear of ignoring some just as deserving, forbid. One pleasant *good* face brings back a feeling of sadness, and that is the likeness of Mrs. A. L. Hallenbeck, whose untimely death I have already spoken of in a footnote to one of the Straws in this issue. Quiet and unassuming though she was, she will be remembered by all who attended that meeting.

THE NAME OF THE BIRD THAT PUNCTURES THE GRAPE.

You will remember that a neighbor of ours captured a peculiar kind of bird that was caught in the act of making pinhole punctures in grapes in Medina Co. One specimen was sent to Prof. Lawrence Bruner, whose biographical sketch appeared in our last issue, and this is what he says of it:

The bird seen is the Cape May warbler (*Dendroica tigrina*). While the bird's beak is admirably fitted for such work, that it really is the culprit seems a surprise, since the warblers are supposed to be practically insectivorous in their food habits. Just at present I do not happen to have a life-history of this bird at hand. I would suggest that you write to Dr. Merriam, of the U. S. Department of Agriculture, Washington, for a statement of grape-puncturing birds.

LAWRENCE BRUNER.

Lincoln, Neb.

As Prof. Bruner is a very thorough student of nature I am sure he is right in giving the name. Moreover, I find the Standard Dictionary gives the following:

It is an American insectivorous mniotiltoid bird, usually brilliantly colored, and with little powers of song, as the common summer or yellow warbler.

The species seems to be somewhat rare in this vicinity; but there are enough of them, from present indications, to puncture every grape on a vine. As I pointed out in our last issue, bee-keepers should put their fruit-growing neighbors in possession of these facts, and thus take the blame off from the bees and put it where it belongs.

BEE-STINGS, AND THEIR PHYSIOLOGICAL EFFECTS.

A SHORT time ago Dr. R. S. Lindsay, of Philadelphia, wrote us, asking for information regarding the effects of stings on the human system. I spent considerable time in looking over our back volumes; and as the reply I made to the doctor may be useful to others I decided to put it in permanent form, and here it is:

Dec. 10.

Dr. R. S. L., Philadelphia—

Dear Sir:—The average bee-keeper is not at all affected by swelling after being stung. He experiences the same sharp pain, but no fever or other unpleasant effects follow after two or three minutes. The system seems to become inured. But occasionally, when the bee stings along a vein there is an effect as explained on page 68 of our issue for January last. We do not know to which school of medicine you belong; but the homeopaths use a great deal of *apis mellifica* in the form of a tincture. We have been supplying Boereck & Tafel, of New York city, with bee stings in lots of 10,000 at a time. We are supplied with a wide-mouthed bottle holding about 2 ounces, and filled about two-thirds full of sugar of milk. A comb of bees is placed before a window, and from this comb the bees are picked off one by one with one pair of tweezers, while another pair removes the stings, the latter dropping into the sugar of milk. The bee in each case is crushed immediately before the removal of the sting. In this way the stings are removed until the whole number are in the jar, when it is corked and sent to the parties named. The apiarist can usually work only about three or four hours a day at removing the stings; and even then he experiences pain in the eyes, and a sort of sickness from inhaling the odor of the poison.

As you see by the references below, there can be no question but that the stings do relieve certain kinds of rheumatism; but just what kinds I am unable to say. A letter addressed to the persons whose names are attached to the articles would

probably secure the desired information. The following is a list of the journals referred to:

1896, Jan. 15, pp. 51, 68; May 15, p. 386; July 15, p. 528.  
1894, Aug. 15, p. 661.  
1893, Sept. 15, p. 713.  
1892, Sept. 15, p. 699.  
1891, Sept. 15, p. 748; June 1, p. 486; April 15, p. 306; Dec. 15, p. 961.

The doctor is investigating the subject very thoroughly, and has promised to send us an article later on, giving the physiological effects of bee-stings, especially so far as they relate to the cure of various kinds of rheumatism.

"BEE-KEEPER FRED ANDERSON."

In all there have been just three persons who have protested against Mr. Martin's story, out of the large number who have spoken very highly of it. Perhaps these three friends (and there may be others who think as they do) have not even read the story. Perhaps they never read *any* stories, from conscientious scruples. With such I have no argument at all. While I know there is a class of novels whose tendency is demoralizing and bad, Mr. Martin's serial is both instructive and moral in its tone. The author himself is an earnest Christian and an active temperance man, and believes in inculcating Christian ideas and principles in every thing that he has to do with. Only the other day we received a letter from a Christian missionary, congratulating us on the excellent moral tone of the serial.

I said the story was instructive. In all that Mr. Martin has written, I do not believe he has ever portrayed California life and incidents any more faithfully and vividly than he has done in this story. Indeed, I believe it is nearly all based on facts, and that the characters that he writes about have been, in some instances at least, real.

It is impossible to please all. Indeed, a few, very few, object to the Home Papers, and a few also can't see any use of the footnote; but the very great majority have expressed themselves emphatically in favor of both.

WINTERING, AND THE VARIATION IN CONSUMPTION OF FOOD.

DOOLITTLE makes the point in the *Progressive Bee-keeper*, that the consumption of food is very much less during the first part of the winter, or when bees are quiet, than later on, when they become uneasy; that it is about a pound a month at first, and from five to eight pounds a month after they have become uneasy. This is entirely reasonable and probable, though I doubt whether there are many other bee-keepers who have noticed the difference—certainly I had not.

I do know that, when I was sick some two years ago, and on the verge of nervous prostration, I was starving to death with plenty to eat. It seemed to me as if it were necessary to eat two or three times as much food in order to keep up my strength (and then didn't do it) that it

now requires while in perfect health (thanks to the beef treatment).

The bees, during the fore part of the winter, are in a condition of health; but later on, the retention of the faeces causes a concition of ill health, uneasiness, and, consequently, a larger consumption of food.

Mr. Doolittle, in speaking of the difference in the amount of food consumption, probably had reference particularly to cellar wintering. Bees, if wintered outdoors, especially in localities where they can have occasional flights, probably will not consume much more toward spring than they would in the fall, the reason being that they have an opportunity for a cleansing flight.

The whole question is interesting and practical; and if we can keep down the tendency toward disease in the spring—that is, by feeding them pure wholesome sugar syrup—then I think the food consumption will not vary greatly from the early to the latter part of winter.

#### MR. BENTON AND APIS DORSATA. □

PROF. A. J. COOK, in the *American Bee Journal*, deploras the action taken at the Lincoln convention against the importation of *Apis dorsata*, and wonders whether the prejudice against one of the employes of the Agricultural Department, Mr. Frank Benton, was not really the foundation for this action. If there were objections to the person who would be likely to be employed by the general government, then he would "make the objections to the individual, and not try to balk the enterprise."

It might be stated, however, that, if Mr. B. is a *persona non grata* to the mass of bee-keepers, or their leaders, there is another man, Mr. W. K. Morrison, who is, perhaps, just as capable of performing the task. He is anxious to undertake this work, and his plan has been already outlined in these columns. Perhaps it is not necessary to repeat that I have been all along in favor of this plan, because it does not involve the expenditure of money on the part of the government. What Mr. Morrison does need, however, is personal influence of men in high standing in the councils of our nation. He would expect to secure the coöperation and assistance of other nations in a similar way, and all countries alike would share equally in the benefits, or in proportion to the assistance rendered. I do not believe that bee-keepers as a rule would be opposed to such a movement, and perhaps this would satisfy the desire of Prof. Cook.

#### THAT HONEY-JUMBLE RECIPE A SUCCESS. □

□ IN our last issue, page 884, Dr. Miller gave us, under the heading of Straws, a recipe for making honey-jumbles. You will remember I said in my footnote, the getting hold of this recipe was a real acquisition: but I feared that the

women-folks of our homes would not be able to duplicate the jumbles sent out by the large bakeries, in quality and lightness. Well, it seems the women-folks in Dr. Miller's family have made some jumbles that, to my notion, are fully equal to those we have been in the habit of buying. Indeed, the flavor is a little superior, owing to the better quality of honey used. Well, here is what the doctor says:

I send you by this mail a sample of honey-jumbles made from the recipe given in "Straws," Dec. 15, the only difference being that, instead of considering 4 ounces of soda the right thing for a barrel of flour, the cook insisted it should be 4 pounds. I've no doubt that's correct. Of course, we didn't use the whole barrel of flour at the first trial. If you like them as well as I do, I think you'll admit that there must be some unselfishness in me to send you the last of the batch—they were made several days ago—instead of eating them myself. I've eaten four to six at a time without killing me. If this crowded season ever gets by so there's more time for cooking I want to have the same recipe tried with less water and all honey, instead of honey and molasses. The only trouble with this lot was that the dough was so soft it was hard to handle.

After testing them myself I gave samples to our printers, and they all united with me in pronouncing them to be as good as the best jumbles ever made. "Barney," the head printer, would have to get his wife to make some, and I am of the same mind.

It seems there was a slight mistake, probably, in the recipe. One of the ingredients was carbonate of soda, 4 ounces, and it appears that it should have been 4 pounds. The whole recipe, then, with this correction, will read as follows:

□ Flour, 196 lbs.; lard, 3 lbs.; honey, 12 gallons; molasses, 3 gallons; carbonate of soda, 4 lbs.; salt, 1 lb.; water, 3 gallons; extract of vanilla, 1 pint.

Of course, the proportions in this recipe are too large for domestic use; and for the convenience of our women-folks I have reduced it to one-fortieth, figuring 12 lbs. to the gallon of honey and syrup. The recipe will stand thus:

Flour, 5 lbs.; lard, 4 oz.; honey, 3¼ lbs.; molasses, 14 oz.; carbonate of soda, 1¼ oz.; salt ½ oz.; water, 1 pint; extract of vanilla, ⅓ gill.

If the honey is not of heavy body, increase the quantity slightly. Perhaps the women-folks would prefer to have this reduced to "cupfuls;" but as such a measure is very indefinite, we can get at the result more exactly by giving the figures in pounds and ounces, and I suspect it important that the proportions be as near exact as possible. I believe it would be possible to use all honey instead of molasses and honey.

If all the women-folks can succeed as well as Dr. Miller's have done, this recipe is going to be of great value to bee-keepers. Every bee-keeper who has honey to sell ought now to be able to offer to his customers honey-jumbles, homemade, and they will sell like hot cakes.

It might be well to call attention to the fact that jumbles will keep almost indefinitely. Indeed, they seem to improve with age. If they get a little dry, shut them up in a bread-crock and then see how moist they will become.

#### AT THE ATCHLEYS.

Dec. 8.—I omitted to mention that the bees by the office door have not only become accustomed to people passing, but so used are they to the tramping on the floor that stamping and jarring the floor has no effect on them whatever. They have apparently forgotten how to sting; and although they are handled repeatedly without smoke or veil, no one has ever been stung by them.

#### A MULE WITH A BEE-VEIL.

In unloading bees it is often desirable to drive right in among the hives. Well, bees seldom trouble a horse more than to buzz about his head; therefore the mule trained for this work wears a bee-veil made on purpose for him, and thus equipped he goes anywhere without any reluctance whatever.

#### THEIR 500 NUCLEI.

The Atchleys have a little more than 500 hives now, devoted to queen-rearing; later on they will be divided so as to make a full thousand. They are located in six apiaries, four to seven miles apart. Yesterday we visited the Cyprian apiary, the Holy Land apiary, and the Carniolan apiary. So far as I can learn, they have a locality here that furnishes honey to some extent every month in the year. They do *not feed*, and with any decent care there need be no robbing. I have looked over hundreds of hives, and there were almost no weak ones, and none but that are well provisioned. As a rule, eight frame Dovetailed hives are used. I suggested that these were larger than necessary; but, all things considered, I believe they are about right. With smaller hives there would be more trouble on both extremes—getting out of stores, and getting the hive full of honey or full of eggs and brood before the attendant got round. During 1896 they have raised about 3000 queens and secured about 10 tons of honey. Our veteran readers may remember I once advocated, pretty strongly, putting the hives on the ground, with *no bottom boards*. Well, here is a whole large apiary worked on that plan. It is Willie Atchley's apiary of Holy Land bees. It stands on a sandy knoll shaded with wild grapevines and live oaks. The sand is banked up a little around the hives, and the entrance is contracted by sand piled up a little on either side. It seems to work admirably. In a damper soil I would prevent rotting the hives by a small stone or half-brick under each corner, then make it tight around the bottom by clean sand that will dry out quickly after a rain. Any kind of bottom-board is pretty sure to make a harbor for insects, to admit cold air underneath, to rot, warp, or be in the way. This stock (100 colonies) of Holy Land bees has all been reared from a queen from Baldensperger, direct, in 1894.

There isn't a trace of bee-paralysis or foul brood anywhere in this part of Texas. I have looked the apiaries over carefully, but didn't see any thing of the symptoms of paralysis.

#### HOW TO CUT PERFORATED ZINC FOR ENTRANCE-PASSAGES.

Have the strips so that a *very narrow* piece rests down on the bottom-board. It is like this: It bothers a horse to step over a board a foot wide, but he can step over a strip 3 inches wide, when set edgewise on the ground, without any trouble. So with the bees. To get the correct

spacing there must be just a little zinc left on the lower edge, so as to exclude the drones but to admit a worker loaded with pollen; don't trouble him to raise up his heels so he can get over a board more than "knee-high."

#### THE TEN-YEAR-OLD BEE-KEEPER AND ENGINEER.

Leah Atchley, ten years old, has just been showing me through her apiary of ten hives. She can lift out the combs and find the queens as deftly as almost any one whose eye meets this. Not only this, but when the factory was started up to fill a small order she took her post as engineer and fireman. It is worth a lot to see her black eyes sparkle as she showed me she was as much at home here as with the inside of a bee-hive. Her father says he would rather trust her to keep up steam, and see that every thing is "O. K.," than any hired man he can get. As the boiler is 12 horse power and the engine only 10, it is not very hard to do the firing.

It is in just this way that the whole family help in the business. While Leah looks after this department, Charley, aged 17, runs the planer, saw, and other machines. Miss Amanda is cashier for the firm; takes charge of the funds, does the banking, pays off the help, etc.

You must not think from what I have written that their children are all work and no play. If you could hear them now you would think from the childish voices and merriment there was no lack of recreation. It is  $2\frac{1}{2}$  miles to school, it is true; but "Nick," aged 13, just brought me his department-card, to show that he stands from 90 to 96 in nearly all his studies. The 96 was for penmanship, and he got it by doing business *with a pen* in his father's office. His "arithmetic" was almost as high.

#### THE CLIMATE OF SOUTHERN TEXAS, ETC.

Beeville is about 30 miles from the Gulf, 50 miles by rail; Corpus Christi is about 60 miles by rail, and quite a business is now growing up there in early vegetables for the North. Before the freeze I have spoken of, tomatoes, wax beans, summer squashes, etc., were being shipped daily. This freeze during the last of November was a very unusual thing. Many winters pass without frost enough to damage the most tender stuff. During the great Florida freeze of two years ago the orange-trees about here were either killed or greatly injured. I have now been here three days, and the temperature has ranged from 46 to 76. On Sunday, Dec. 6, the sun was so hot I was glad to see it go down. During the day a shade-tree was very refreshing.

#### THE EXPERIMENT STATION.

Yesterday we visited a branch of the Experiment Station, under the management of F. A. McHenry, about five miles from Beeville. He is testing oranges, lemons, pineapples, grapes, etc. Nearly a hundred varieties of grapes and as many of peaches are being tested. By the way, friend Atchley had so many peaches last year that bushels were allowed to go to waste. One reason was, however, they needed marketing at just their busiest time with the bees. The fruit is rather smaller here than further north. I was told by some that garden stuff didn't do well; but with plenty of water they get fine crops on the experiment farm.

Before Mr. McHenry was given the management he sold \$227 worth of cabbage from two-thirds of an acre, on a little garden-patch in Beeville. Not only this, but he produced similar crops on the same land year after year. Of course, he used large quantities of stable manure, and water when needed; and yet most

people around here will tell you stable manure won't answer—"no good in this climate." This may be to some extent true, without water. On the station farm, McHenry makes a 12-foot windmill water about three acres very well; but I think the wind is more regular every day here than in the North. The canagarie root does finely here, as, in fact, do all roots, pretty nearly. Sweet potatoes and yams (including the vineless) are right in their home, and, of course, no irrigation (as a rule) is needed. They bring 50 cts. a bushel now. Irish potatoes can be grown only in early spring, and they must be used pretty soon, for they won't keep through the summer. McHenry made last spring \$75 from an acre of early potatoes. The variety that did best was the Triumph—the same I have placed at the top of the list for an early potato in the North. The numerous varieties of non-saccharine sorghum, kafir corn, and all the rest, would puzzle a botanist, let alone a farmer. The chicken-corn sorghum will grow two crops in a season. Just cut it when the seed is ripe enough for chickens, and another full crop springs right up from the suckers. If you break the stalks down, the chickens will do the harvesting. Eggs are 20 cts. a dozen, and chickens can be batched every day in the year.

Now, you need not all move down here, for both McHenry and Mr. A. assured me there are any quantity of folks here, just as there are up north, who are going about complaining they can't find any thing to do. Apples won't do here, but plenty are grown in the northern part of the State. W. C. McDowell has a very pretty irrigated garden right in the town of Beeville. I was pleased to see a beautiful stand of transplanted onions. They are red Bermudas. He says they will mature in April, and he often gets a nickel apiece for onions averaging 1 lb. each.

A great variety of hardy vegetables stand out all winter. Cabbage was considerably injured by the freeze, but this does not often happen. Cotton cloth is used over the plant-beds, but is more to keep off the hot sun than to protect from frost. Winter cabbage brings 5 cts. per lb. at retail. We saw a few heads ready to cut, and fresh cabbage brings the above price this month. McDowell scatters fresh manure, both stable and poultry, very liberally through his cabbages; then he cultivates it in thoroughly, turns on water, and says the manure never hurts *his* cabbage. When I was introduced to the manager of the experiment station he said he had just purchased our tomato book, so you see we received a warm welcome, both from himself and his good wife. The State has given him 100 acres of beautiful land, and his work is to see what can be grown on it profitably.

Beeville is a town of windmills. They get water at about 50 and also at 100 feet deep. The deep vein washes nicely with soap, but is somewhat alkali, after all. The price for drilling wells here is only 50 cts. per foot, the owner paying for all pipe needed to case off the surface water.

I must not forget the fireflies of South Texas. One warm night they were scattered over the ground so that it literally sparkled with twinkling jewels. When I tried to catch them they either "went out" or hopped like a cricket. I am told they are a sort of snapping-bug fireflies.

Somebody brought Mr. Atchley some grape cuttings from California. They were planted in his garden in front of the house, and in less than *one year* he had a few bunches of ripe grapes, and these were cuttings only—no roots at all to start them.

Dec. 12.—Here I am at Tempe, Arizona,

among the grand old mountains once more. If the chap who wrote—

I love thy rocks and hills

had taken a trip through Arizona he could have found lots to love, especially as far as "rocks" are concerned. Next to the mountains come the great alfalfa-fields, kept as green and bright with the sparkling water as was ever a clover-field in May or June. It made me think of the words of Scripture, "He maketh me to lie down in green pastures; he leadeth me beside the still waters." I really do not know of a more refreshing and reviving sight than a field of alfalfa in the month of December; and then to see droves of cattle, sleek and happy! In crossing the Texas plains, somebody told me they figured it wanted five acres to a cow on those ten-thousand-acre pasture-lots. My impression is that some of the alfalfa-fields well irrigated might reverse the proportion, and put five cows on *one* acre.

By the way, the past season has been a grand one for alfalfa honey. Mr. J. P. Joy, Secretary of the Bee-keepers' Exchange, produced from 500 colonies, in only two apiaries, 50,000 lbs. of honey. Mr. J. Nippert and others have done as well or better. This organization has been for some years past purchasing the cans for their members by the carload, and in the same way the secretary makes sales and ships the combined product of all its members; and from what I gathered at the convention I think it has been of great benefit in both ways. They have regular meetings four times a year.

#### SUPERSTITIOUS MOUNTAIN.

Dec. 14.—Before daylight my brother, J. H. Root, Mr. John Nippert, of Phoenix, and myself, started out—I on my new Columbia wheel, and the others in friend Nippert's buggy. Jess (my brother) and I rode the wheel alternately; but toward noon I went on ahead so as to get my nap before dinner, and be in good trim for the mountain climb in the afternoon. The day was most beautiful, like all the days so far in Arizona, although the morning was rather cool. After passing the beautiful town of Mesa, and getting clear out on the wild desert, I found the most beautiful wheel-riding I have ever found in the world. It is true, I have seen gravel pikes, shell roads, and asphalt pavements equally good, but never before have I seen the whole wide country so I could go where I would and find it equally good *everywhere*. There had been just rain enough to form a crust on the surface of the sand, and this seemed to leave hardly a trace to show where the rubber tire had passed. There were bushes, but so scattering they made one think of a tastily arranged garden; and the broad, constantly curving walks between the shrubbery made an ideal ground for the wheel.

As we neared the mountain, beautiful flowers began to appear, of varied colors and of different form from any I had ever seen. At different points along the way the song of birds rejoiced my heart, and with it all the fascination of the beautiful weird mountain that came nearer and *nearer* every moment caused me to sing again and again, "Praise God, from whom all blessings flow."

It is 35 miles from Tempe to the mountain, but the latter seemed so near about 10 o'clock I felt sure I should soon be there. But the nearer I came the more the road seemed to unwind, or lengthen out, until I began to think there was some ground for giving the mountain its name. I was always *almost* there; and the road seemed always dipping down into a ravine just at the foot of the mountain; but the "downhill" didn't seem any easier, and finally

I began to get both tired and hungry. When I did at length fetch up at the store at Goldfield I was told my road had been *uphill* all the way, and that, in fact, I was on ground 200 feet higher than Tempe.

I was soon at the mining boarding-house, and disposed of a cup of coffee and a piece of pie in a very short space of time. None but a wheelman can tell how really delicious a little refreshment is after such a ride. The obliging Chinese cook then placed at my disposal quite a dainty cot on which to take my nap. It was in a cool tent outside, and, in fact, all the buildings in the town, nearly, are roofed and sided up with cotton cloth. It gives air and light both, and seems to be warm enough for this climate.

Jess and Mr. N. came around in about half an hour, and then we had dinner for sure. Although everything is hauled here by team from Tempe (the nearest railroad station) we had nice meals at an average of only 33 $\frac{1}{2}$  cts. each. We were told a whole day is needed to climb the mountain and return, but we decided to make the best we could of it in half a day. A large canteen of water and a basket of lunch was all our luggage. When a man said it was still two miles to the foot of the mountain we could hardly believe him. Why, there were those great towering rocks *right in front of us* now. Really we tramped hard for an hour before we were in the trail at the foot of the canyon.

Let me say right here, that we got into several sore troubles by carelessly losing the trail. Whatever you do, don't lose the trail, when there is one, in climbing a mountain.

I told you the mountain always seemed nearer than it actually was. Well, when we were right before it, a column of rock that might be a thousand or more feet high seemed to bend over and menace us by threatening to fall on our heads. There was something weird and uncanny about it, but awful in its grandeur. I can't tell now whether that rock is straight up and down, or whether it leans out from the mountain. Again and again I gazed at it and then sat down to gaze at my leisure, and finally voted the sight of it alone was worth the whole trip. With its strange domes and spires and fanciful turrets and battlements, I think it should be called the *Enchanted Mountain*.

The trail first led up a canyon, and I tell you it is work indeed to climb it, even if you follow the trail. If you get off it, look out. At every turn, however, you are rewarded with new beauties, lofty rocky spires of ever changing form and color; and a little further along, pools of deliciously cool water, in the water-worn cavities of the rock. At one point you walk over a tiled floor almost smooth, only on an incline. The tiles are diamond-shaped because of checks or cracks in the rock, and they have been smoothed and polished by the gravel that has washed down over them for ages. The slope of this smooth floor is so great at some points that we crept on our hands and knees, and finally we had to leave the bed of the dry canyon and work along loose rock at the side, without any trail for a guide. My plan was to reach the backbone of some of the lower cliffs, and then crawl up on the ridge; but when I got so as to look through the "fins" on the backbone I was terrified at seeing the other side was a fearful steep cliff almost straight down 500 feet or more, and only sharp and needlelike spires of rock on the summit. By dint of crawling, careful climbing, and helping each other, we managed to get up at the very top of every thing, except a rock that looks like the crowning turret or dome, when the

mountain is seen about 50 miles away. We sat at the foot of this dome and looked up. From our position it looked like a whole and complete mountain; but from the valley it was only a sort of "knob" on top. I rather wanted to scale this too; but my companions said if we did we should have to stay up there all night, and we had no blankets, etc. I consoled myself by taking a nap for a few minutes, with the old rocky mountain for a pillow. The sun had warmed the rock so it was quite comfortable.

Then down we went. We essayed to take a shorter cut, but several times we were brought to a standstill by a precipice straight down, right in our path, and then we went back and tried another route. I slipped once and barked my shins; then I got a cactus, with its spines, into the other leg and in one arm. These cactus spines are barbed like a fish-hook. They go into the flesh very easily; but if you try to pull them out, "Ouch!" It is really worse than a bee-sting if you try to draw them out slowly. If you jerk them out quickly, however, it is much better; but each spine leaves an ugly wound. The ball of spines looks like a chestnut-burr, but they are larger. Twice the spines went clear through the leather of my boot, and pricked my feet. Jess sat down on one while sliding down the rocks. He said I shouldn't tell: Mr. Nippert stood the tramp better than either of us. We found many beautiful flowers on the mountain peak, never found in the valley below; and friend N. found an Italian bee clear on the top. The view from the top, of the valley below, and the mountains on the East piled peak upon peak, was grand. The little town where I am now writing looked like a small apiary of queen-rearing bee-hives.

This is a new mining town away off in the mountains. There are about 60 hands, and the stamping-mill runs day and night.\* A very pretty little reading-room has just been put up, and it is here I am writing. I feel considerably bruised and sore from the severe exercise of the day; but my appetite is tremendous, and my digestion excellent; I am getting in training for my final expedition to the Grand Canyon of the Colorado, 280 miles distant over the mountains.

#### PURE DRINKING-WATER.

In New Orleans, in Beville, and in San Antonio, Texas, the water I drank was more or less brackish, or alkaline; and even though I drank boiled water I had a metallic taste in my mouth, and began to feel a longing for rain water, which I could seldom get in traveling. Later I was troubled with painful eruptions all over my body. My brother, who is a druggist, suggested it was the change in drinking-water, and went to the Tempe ice-factory and got me some distilled water. I can't tell you how delicious it was. I drank it again and again. In 24 hours the bad taste in my mouth was gone, and in another day the eruptions began to disappear, and now they are all gone. A large canteen of this pure water was carried up the mountain, and it added to my comfort and enjoyment very materially. I do think rain water boiled, or distilled water, would of itself cure many of our troubles with poor health. On p. 752 we pictured an apparatus for producing

\* Gold is mined here by sinking shafts and running out drifts, much as coal is mined in the East. The rock is then pounded up by a great stamping-mill. By means of water and quicksilver the gold is extracted. We found abandoned mines, holes of all sizes all over the valley and up the sides of the mountain. No one knows how much the stamping-mill is producing; for if it should get out that they had "struck it rich," everybody would be crowding around them.

distilled water at very little expense, and I fear not enough attention was given to a very valuable invention.

There, I have done a big day's work with muscle, and a pretty good evening's work in writing it up, and yet I feel tiptop.

Good-night, and may God bless you all, dear friends and readers of GLEANINGS.

---

## OUR HOMES.

---

The Spirit of the Lord is upon me, because he hath anointed me to preach the gospel to the poor; he hath sent me to heal the broken-hearted, to preach deliverance to the captives, and recovering of sight to the blind, to set at liberty them that are bruised.  
—LUKE 4:18.

A bee keeper asked me to take a ride with him. We were going quite a long trip, and I expressed fear that his light young pony might not be equal to the task. He said we would let her take her time, and he guessed she would make it all right. She seemed very docile and willing, but I noticed she was only partly "broke." She was rather poor in flesh, but he explained this by saying he had owned her only a short time. Our road was right along the track; and when a train came in sight we unhitched her, and my friend had quite a little tussle with her; but he held her so she could face the danger, was very kind and gentle with her, and it was soon over. He calls her "Pet," and I soon found he and Pet were getting to understand each other better and better every day.

Pet's sad story was something like this: Her owner happened to want a horse when she was about three years old. Because she didn't seem to understand, and wouldn't pull on a heavy load the very first day she was put into a harness, he whipped, pounded, and clubbed her, until there was almost nothing left of the poor little colt. She came of highbred stock, especially for *speed*, and not for heavy work; and so when her master didn't succeed in getting her to pull he in disgust sold her, or what was left of the poor thing, for only \$12.50. My friend, who is a Christian man, found her at this stage, and gave \$20.00 for her. Bruised and bleeding, he (like a good Samaritan) took her home, won her little horse heart by treating her kindly, and she soon became a "pet" indeed. He bought a light, strong covered buggy, a neat little harness, and Pet soon showed her gratitude by just making the rig "spin" as she carried him back and forth between his apiaries. On our last trip, as he was hitching her up I noticed he had trouble in getting the crupper in place. When asked about it he replied:

"Why, Mr. Root, you surely have noticed how her back down near the crupper is caved in; well, this was done by a heavy blow with a club before I got her."

I had noticed this, and had wondered if it was a result of the pounding. But, notwithstanding, pet seemed in a hurry to get started, and she carried us two men almost 50 miles in a day, and seemed as bright and fresh, almost, during the last mile as she did the first. The whip was never used once, to make her go, and she never once slackened into a walk unless her master made her do so. During the week or more that I knew her she had picked up amazingly, although it seemed as if a large doublehandful of oats was about all she required at a feed.

Does your heart boil with indignation as you read this little story? I know of at least one

little *woman* whose mild gray eyes (ordinarily mild) will fairly blaze as she reads this; and sometimes they blaze to good purpose, too, in behalf of the bruised and pounded horses. What is the remedy, friends? We have a Humane Society, I know, and it is doing a grand work; but the greatest work is to be done along the line of our text in "setting at liberty them that are bruised." We want more "good Samaritans;" but, above all, we want the horse-men and the horse-owners converted to the Lord Jesus Christ, then we change the hearts of these fiends in human form, and thus bring "deliverance to the captives" for both man and beast.

Not very long ago, in a town of 10,000 inhabitants the Salvation Army was holding meetings. While they were singing "Is your name written there?" one of the workers noticed a young woman in the audience, looking very serious. In a gentle voice some one said to her: "Dear sister, would you not like to have your name written there?"

"She did not reply, but burst into tears." When further pressed she replied:

"Oh if it were only *possible!* but it can never, *never* be written there," and then she sobbed again convulsively.

Reader, what do you suppose those Salvation Army workers brought to light that night before they were done? Something like this: Some years ago, when this girl was only a child of about 14, having no home she went to keep house for a relative, a man grown. This person (*not a man*) set to work to *rob* the child, whom he was expected to protect. To rob her of her *money*? Bless your heart, she had no money, and that is why she was obliged to work out. She was too young to work for strangers, and so she was to have a home with a relative. Besides, this relative belonged to some kind of a religious organization—at least, I think he did; but those who knew him best were aware that he was a bitter skeptic. He was one of that hard sarcastic kind who call all Christians hypocrites. Why, I have seen so much of this in my life that I have begun to think that, if I were living a life of daily *crime*, I wouldn't talk against Christians and the Bible, for fear folks would suspect something. Before that girl left the meeting she made a full confession, accepted Christ Jesus and him only, and started out on the new life, bearing a cross that few of us can even comprehend. Let us see: She had by this act cut off every friend she had in the world, unless it was the Salvation Army people she had just become acquainted with. She was keeping company with a good young man, but of course *he* would drop her at once and for ever. Well could she say in the words of that grand old hymn:

Jesus, my cross have taken,  
All to leave and follow thee;  
Naked, poor, despised, forsaken,  
Thou, henceforth, my all shall be.

Her new friends found her a home, and she has ever since lived a consistent Christian, so I am informed. She lost friends and station in society. The great world turned against her. No, no! Not the *Christian* world. *God forbid!* On the other hand, her load of guilt and sin was gone. That burden she had borne for so many years in silence was lifted, and the love of Christ Jesus shone into her hungry soul. Now her name *could* be "written there." Oh glorious thought! Under similar conditions the dear Savior had said, "Her sins, which are many, are forgiven."

Let me use again the closing words of a well-known hymn:

He looked on that lost one, "her sins are forgiven,"  
And the sinner went forth in the beauty of heaven.

Just a few thoughts in closing. The Salvation Army are noted the world over for just this kind of work. Dear reader, if you have ever spoken ill of them, don't do it again. Are *you* a follower of Christ Jesus? are you a member of any church? then stir yourself, as in the language of the text. Look after the horses, and make yourself felt in your community. But don't stop there. Look after the fatherless and motherless girls. I am sure there is need of it. Within the past year, two cases such as I have mentioned have come to my notice, more than a thousand miles apart. Do you say there is a law? Yes, there is; both cases were up in court. In one the gray-headed sinner got clear, so people said, because he had lots of money, and the poor girl had none. In the other, he paid the girl some of his money, and is supporting her child. In the latter, my advice was asked about keeping the girl after the facts of her former history came out. I simply asked:

"Is she doing her work well? is she faithful and efficient?"

"Oh, yes! she is the best help I ever had. This thing happened years ago, when she was a child. There has never been a breath of reproach against her since."

"Then keep her, *by all means*. Give her all the help and encouragement possible. When Christ Jesus has forgiven, it'll become any of us to judge or condemn."

Now, then, let us all help on the work of "healing the broken-hearted," "deliverance to the captives," and giving "liberty to them that are bruised."

#### CHILD-TRAINING.

[The subjoined paper bearing the foregoing title was read originally at the Congregational Conference at Mallet Creek, of this county. As there was a general desire to have it given again, it was read before the Parents' Meeting of this place, which meeting I had the pleasure of attending. I decided in my own mind that it ought to be heard by a much larger circle of readers, and at the close of the meeting requested that I might have it for publication. I had scarcely made this request before there was a general expression on every side to have it put in pamphlet form, as nearly all of the auditors had friends whom they wished to read it.

Miss Smith is superintendent of the primary department of our Medina public schools, for which position, by her beautiful Christian spirit, her special training, and long experience, she is exceptionally well fitted. I wish she might be heard by every mother and father in this land; and those who feel as I do about it I hope will see that it is distributed among friends. After this journal it will be put in the form of a neat little booklet, at a price just above cost; viz., 2 cts. per single copy; 17c for 10, or \$1.50 per 100, all postpaid. At 2c we will send single copies to any address given in this country. Every family ought to have one, and I hope our Christian readers will help scatter it. Remember that the time to train a man, and so cover a multitude of sins, is when he is a child.

N. B.—We shall have room to publish only half of the paper in this issue, and it will, therefore, be concluded in our next.—ED.

#### CHILD-TRAINING.

What is a child? and how shall he be trained? are two of the most important questions that can be asked. "What is this lump of flesh, breathing life, and singing the song of immor-

tality?" If we could answer this question perfectly we might say to the child as Tennyson said to the little flower plucked out of the crannies:

Little flower, if I could understand  
What you are, root and all,  
I should know what God and man are.

Patterson Du Bois, in "Beckonings from Little Hands," says of his four-year-old boy, "I would not have hurt him for the world, but I did not know what a child was, and consequently could not shield him from myself." Think of it, parents and teachers, helpless childhood wholly dependent for guidance and protection upon those who, like this father, do not know what a child is, either mentally, physically, or spiritually, consequently can not shield him from their ignorance, biased judgments, and moral deformities.

I often marvel at God's confidence in human nature as shown by the responsibilities he has placed upon us. I can imagine the angels in heaven demurring at his conferring free moral agency upon frail, sinful man, saying, "It will never do. Man with his selfishness and downward tendencies will wreck the moral universe if given the power of choice." But I marvel more that he trusts sweet innocent childhood to the care of weak blundering humanity. It must be for our sakes, that this responsibility may stimulate us to our highest and best; that the father, feeling his need of divine help in bringing up his family rightly, may himself be led to the Strong for strength, and to the Wise for wisdom; that the mother, desiring for her children the privilege of prayer, may herself call first upon the name of the Lord.

What is it to train a child? I was glad to find that Webster bears me out in saying that it is not thwarting, breaking, scolding, or subduing, as many seem to imagine, but guiding, leading, drawing, and directing. It is to form by practice. There is a good deal of so-called training which is only repression. Training develops, strengthens, and builds up. Repression weakens, discourages, and stupefies or hardens, and makes the child rebellious and deceitful. If, instead of "Johnny, sit still," and "Johnny, don't tease the cat," and "Johnny, you make me nervous," you would only find something that Johnny might do, how happy he would be, and what a relief it would be to your tired nerves! If you knew what a child is you would know that every muscle in the little body aches to be on the move, and every nerve tingles with life and energy, and that it is your work to direct these into right channels, not repress them. It is the empty hands, heads, and hearts that go astray. It was the empty house swept and garnished, you remember, into which the seven wicked spirits entered. If we will only occupy hands, heads, and hearts with the good and the true, we need to concern ourselves very little with the bad and false. For example, if a child is inclined to be cruel to birds or other animals, instead of talking to him so much about his cruelty, endeavor, as you have opportunity, to interest him in the many curious habits of animals, the building of their nests and homes, and the devotion of the mother to her young. Picture to him the life of constant fear and danger that these timid creatures live, never safe, always alert. Call his attention to the provision made by our heavenly Father for their safety. Tell him of the preparation made by the wild animals for winter, reminding him that no such preparation is needed for the domestic animals, as they have been entrusted to our care. With suitable stories lead him to sympathize with them in their suffering when robbed of their young, or

otherwise mistreated, and teach him that it is the privilege of the strong to protect the weak.

Sometimes our "don'ts" suggest to the child the very course we wish him to avoid, and which but for us he would never think of. No doubt many a poor fly has lost his legs and wings because some child had been repeatedly told that was a thing he must never do. "The thought is the first step in every act. Every thought has a tendency to repeat itself. Every repetition of the thought strengthens the desire for action. Hence to suggest the thought of a wrong deed is to sow the seed of a wrong action."

Another danger of "don'ts" is that they antagonize the child, and prepare the way for a spirit of opposition and rebellion. Mrs. Hannah Whitall Smith tells of a little boy who said to his playmate, "Let us cut ourselves with this knife." When asked why he wanted to do that he said, "Because mother told me not to!"

Judicious praise is a great help in child-training. Commendation of a generous deed will incite to greater generosity than a whole book on the meanness of selfishness. A bad person may fill us with disgust, but only a good one can inspire us with noble purposes and high aims. Nothing can save like high ideals. That is what God gave us Christ for.

Nor must we forget that character is formed by *practice*. There is positively no other way. Every time we succeed in getting a child to make a right choice, or voluntarily do the right thing, we strengthen the upward tendencies of that life, and make it stronger to resist the next temptation. It is as true in the moral world as in the physical, that exercise strengthens and neglect weakens. It should be our care to strengthen the good by exercise, and weaken the bad by neglect.

Much valuable time is usually lost before the work of training the child begins, because parents do not realize the strength of habits and the rapidity with which they are formed. I know a child who is being allowed to become confirmed in a disagreeable trait because the mother is hoping the child will grow ashamed of it as she grows older, and correct it herself. She may, but it will be at the cost of much mortification and loss. Too many wait till the fair garden is well covered with weeds, then attempt to pull these up and sow good seed. The results from this course are so meager that such soon grow weedy, and then ease their conscience with such old saws as "Theories are all right until you attempt to reduce them to practice;" or, "What is bred in the bone stays long in the flesh;" or, "The child is just like his father's folks; it's no use to try to do any thing with him;" or, "He's no worse than other boys. Boys will be boys;" and then with a pious resignation that the Lord never asks for, they pray instead of working, and trust God to do that which he has given them to do.

Many fail to accomplish all they might in this work for the child because only half believing in the possibilities of child-training. According to your faith and skillful persistence will it be unto you, and your persistence will depend upon the measure of your faith.

I was trying at one time to teach a left-handed pupil to use the right hand; and as it was an especially difficult case I asked an older brother if he would not help me by taking some pains at home to teach his little sister to use her right hand. He cheerfully consented, but came the next morning to tell me that it was no use to try to do any thing about it, for he tried a whole hour the evening before, and she was just as left-handed as ever. While some, like this boy, lack persistence, others are too

much inclined to bow to heredity, thinking if a child inherits a bad trait nothing can be done about it. But heredity is not like the laws of the Medes and Persians. It can be changed. Heredity is a powerful factor in any life, and should be considered; but I am convinced that environment and training are much stronger forces. We are born with tendencies only, not cast-iron bands or molds. The very ignorance and helplessness of each new life is a pledge of opportunity to advance in spite of all that has gone before. When horses, dogs, and monkeys are being trained, shall we leave the child ren to simply grow up? Notice the results from physical training—chest are developed, muscles strengthened, stiffened joints made supple, and the whole carriage changed from awkwardness to grace and ease by a few minutes' daily practice of correct rules; and one of the delights of the teacher is to see dull eyes brighten with intelligence, stupid faces grow thoughtful, and dull minds quicken by simple adherence to the here-a-little-and-there-a-little method kept up day after day, week in and week out. I know character may be changed by this same method, for I have seen the quarrelsome grow peaceable, the quick-tempered gain self-control, the impatient become patient, the impudent grow respectful, and the careless and inattentive grow studious by persistent, skillful, loving management. O fathers and mothers! how I wish you might all realize what a wonderful opportunity you have when God places a little child in your midst, and says, "Train this child for me"! It might well humiliate you to the dust with a sense of your unworthiness, and raise you to the skies with a sense of the high honor conferred upon you. It should send you to God in prayer, and lead you to scrutinize your life and practices as never before. Notwithstanding, how often this sacred experience is treated as a joke, or a matter of family pride and ambition, and the child regarded more as an object of pleasure to parents and family friends than as a new life to be molded for eternity. The work that might engage the powers of an angel is undertaken unhesitatingly by the thoughtless and ignorant. Herbert Spencer says, "Is the unfolding of the human being so simple a process that any one may superintend and regulate it with no preparation whatever?"

Mrs. A. M. Diaz, in "Domestic Problems," supposes a philosopher in disguise on a tour of observation from some distant isle or planet to visit us. Among the objects that attract his attention are the little children drawn along in their carriages.

"Are these beautiful creatures of any value?" he asks of a bystander.

"Certainly; they are the hope of the country. They will grow up into men and women who will take our places."

"I suppose there is no danger of their growing up any other than the right kind of men and women, such as your country needs?"

"On the contrary, there is every danger. Evil influences surround them from their birth. These beautiful creatures have in them possibilities of becoming mean, base, corrupt, treacherous, deceitful, cruel, false, revengeful; of becoming, in fact, unworthy and repulsive in many ways. Why, all our criminals, our drunkards, liars, thieves, burglars, murderers, were once innocent little children like these."

"And whether these will become like those, or not, depends on chance?"

"Oh, no! It depends largely on training. Children are like wax to receive impressions, like marble to retain them."

"But who among you dare make these early impressions which are so enduring?"

"Oh! the mothers always have the care of the children. That is their mission—the chief duty of their lives."

"But how judicious, how comprehensive, must be the course of education which will fit a person for such an office!"

"Do you think so? Hem! Well, it is not generally considered that a woman who is going to marry and settle down to family life needs much education."

Our philosopher next questions a young mother:

"Where were you prepared for the duties of your mission?"

"I had no preparation."

"But are you acquainted with the different temperaments a child may have, and the different combinations of them? Are you competent to the direction and culture of the intellectual and moral nature? Have you thus, un-instructed, the power, the knowledge, the wisdom, requisite for guiding that mighty force, a child's soul?"

"Alas! there is hardly a day that I do not feel my ignorance on all these points."

"Are there no sources from which knowledge can be obtained? There must be books written on these subjects."

"Oh, yes! but I have no time to read them."

"Do not husbands provide their wives with books and other means of information on this subject?"

"Generally speaking they do nothing of the kind."

"But," adds the writer, "if our philosopher continued his inquiries into the manners and customs of our country he must have felt greatly encouraged; for he would have found that it is only in this one direction that we show such blindness and stupidity. He would have found that, in every other occupation, we demand preparation. The individual who builds our ships, cuts our coats, manufactures our watches, superintends our machinery, takes charge of our cattle, our trees, our flowers, must know how, must have been especially prepared for his calling. It is only character-molding, only shaping the destinies of immortal beings, for which we demand neither preparation nor a knowledge of the business. It is only of our children that we are resigned to lose nearly one-fourth by death, owing to ignorance and injudicious nursery management."

But the loss by death is the smallest part of it. Think of the multitudes mentally crippled and morally warped because of the lack of knowledge of those to whom they have been entrusted! The farmer, stockman, dentist, physician, each has his professional paper. The teacher expects to read and study the subjects pertaining to her work constantly; but how few parents take a paper or buy a book on the subject of child-training!

But all lack in child-training is not due to ignorance and lack of preparation. We do not do as well as we know. I once overheard a man on the train say, "I know how to bring up children." I hastily thought, "Oh! no doubt you are the man, and wisdom shall die with you!" But I listened attentively for his next remark. It was this: "Let parents be themselves what they desire their children to be." And I thought, "Amen!" It is not precepts children need so much as example. Every child is born with a God given passion for imitation, and copies not only your actions and words, but your very spirit, long before he is six years old. It is possible for you in some unguarded moment to undo the verbal teaching of years. A little child was once heard to pray, "O Lord, make us very stylish." Do you not see the spirit of that home in spite of the re-

ligious teaching? Listen to another mother as she is getting the children ready for Sunday-school. "Have you got your Bible, Mary? I wish your father hadn't got your new shoes a mile too big. Can you say your golden text, Susan? Here's your hat. Be careful of it. It is the prettiest hat in the whole Sunday-school. I wonder if Mrs. Jones will let Ella wear that same hat another season. Now, John, behave yourself in church, and mind what the minister says. I suppose I ought to go with you to keep you straight, but I am too tired to go to church to-day. I worked too hard yesterday."

Do you want to know what she did yesterday? She made onion pickles, chili sauce, and ginger-snaps in the morning (she calls this feeding the hungry); in the afternoon she put five rows of inserting in Mary's new dress, tucked Susan's skirt, and ruffled an apron (this she calls clothing the naked). In the evening she attended a card party (this might possibly be called visiting the sick, as most of them were too sick to attend church the next day). How much moral weight will her Sunday words carry? Not so much as the down on one little thistle seed.

## HANDY PATCHER.

54 sq. inches "Mending Tissue" for binding or mending fine Silk and Dress Goods, Kid Gloves, Umbrellas, &c. Does NOT, strong, invisible work in a fourth the time of needle and thread.

# Gleanings in Bee Culture

## American Agriculturist

Weekly. Original, Progressive, Practical.

**Both One Year Only \$1.25.**

By special arrangement with the publishers, we are enabled to offer the *American Agriculturist* in combination with *GLEANINGS IN BEE CULTURE* at the unparalleled low rate of \$1.25 for both papers one year. The *American Agriculturist* is published in five editions. The N. E. Homestead, the Eastern, Middle, and Southern editions of *American Agriculturist*, and the *Orange-Judd Farmer*. Each contains matter relating to its own locality, as well as the latest and most accurate market reports for the country in general. It has departments relating to all branches of farming, articles written by the most practical and successful farmers, supplemented with illustrations by able artists.

Short stories, fashions, fancy work, cooking, young folks' page, etc., combine to make a magazine of as much value as most of the special family papers.

A SAMPLE COPY WILL BE MAILED FREE by addressing *American Agriculturist*, Columbus, Ohio, or New York, N. Y.

Taken separately these two papers cost \$2.00, consequently every subscriber under this offer will get

**\$2.00 IN VALUE FOR \$1.25.**

**PREMIUM BOOKS.** For 10 cents extra, as postage, you can have your choice of any of the following standard books FREE: "Profits in Poultry," "Farm Appliances," or "Farmer's Almanac" (ready December 15). Send your subscription direct to

THE A. I. ROOT COMPANY, Medina, Ohio.

## Two Papers for the Price of One.

The *Farm Journal*, of Philadelphia, a monthly agricultural journal of 16 pages, sent **one Year Free** for one subscription to *Gleanings*, with \$1.00, paid in advance, either new or renewal. In the case of a renewal, all arrears, if any, must be paid in addition to one year in advance.

The **FARM JOURNAL** is now in its 20th volume, and takes the lead among all the *low-priced* agricultural journals of this country and of the world. It gives no chromos, puffs no swindles, inserts no humbug advertisements, lets other folks praise it, and makes good to subscribers any loss by advertisers who prove to be swindlers. The editor was born on a farm, and reared at the plow-handles, and the contributors are practical men and women.

The regular price of this excellent journal is 50 cents a year, and it is well worth it; but by special contract with the *Farm Journal* we are enabled to make the above very liberal offers.

The A. I. Root Company, Medina, Ohio.

## A Bargain!

We have made arrangements to furnish **THE OHIO FARMER**, of Cleveland, O., and **GLEANINGS IN BEE CULTURE**, both papers, for only \$1.50.

**The Ohio Farmer** is well known as one of the very best, largest, and among the leading agricultural papers of America. A 20-page, 80-column paper EVERY WEEK in the year; employs **THE VERY BEST WRITERS** that money can procure; a strong, fearless defender of the agricultural interests of this country, and **CLEAN** in both reading and advertising columns. **IT HELPS MAKE THE FARM PAY.**

THE A. I. ROOT CO., Medina, O.

#### BEEWAX MARKET.

The beeswax market is a little easier of late, and brokers are offering at about 1c per lb. less than a few weeks ago. The tide may turn again before long. It is hard to say. For the present we lower our price 1c per lb., and offer 24c cash, 26c trade, delivered here, for average wax.

#### VANDEUSEN FLAT-BOTTOM FOUNDATION.

There are those who still prefer to use this style of foundation. We have a few boxes, taken in trade, which we offer at lowest wholesale price to dispose of it. Our stock is of the No. 3 thin, about 11 or 12 sq. feet to the pound; 25 lbs. in a box; and we offer it at \$10.50 per box. You can order from here or from Chicago, as we have it in stock at both places.

#### CLUBBING RATES.

On and after this date clubbing rates with the *American Bee Journal* and *Bee-Keepers' Review* will be \$1.75 for new names and \$1.90 for renewals. For example, a subscriber to GLEANINGS, but not a subscriber to the *American Bee Journal* or *Bee-Keepers' Review* may send us \$1.75 and receive GLEANINGS and either of the other papers for one year; but if that person is a subscriber to both papers the price will be \$1.90.

#### MINIMUM CHARGE ON FREIGHT SHIPMENT.

The new issue of the Official Classification going into effect this date, and which governs all freight traffic east of Chicago and Mississippi, and north of Ohio River, contains a new rule which will affect all small freight shipments for short distances. Formerly the minimum charge on any shipment, by freight, was 25 cents. This is now changed to read 35 cents. Those who have been getting small shipments through heretofore for 25 cents will be reafter have to pay 35 cents. This should have a tendency to induce customers to send larger orders, or club their orders, so as to make a large enough shipment to get the benefit of the lowest rate available.

#### HONEY FOR SALE.

We have only a few cases left of 1895 alfalfa extracted, and most of that is in one-gallon square cans, 6 in a case. This we offer at \$4.75 per case; 2 case lots or more, at \$4.50. There are several cases of two 5-gallon cans, amber color, which we will close out at \$7.20 per case.

We have choice new basswood or willow-herb honey in 60-lb. cans, 2 in a case, at 7c per lb.

Buckwheat at 5c per lb. in cans, kegs, or barrels at 4½c.

No. 1 white comb honey, in lots of 100 lbs. and up, at 13c per lb.; buckwheat at 10c; 200-lb. lots of either, 1c per lb. less. Inquiries solicited from those in need of honey.

#### SMALL WIRE NAILS.

In our last issue we gave the revised price list of standard wire nails. We were not at the time posted on the new prices of fine wire nails. We now give them in the following table:

*Cement-coated, except first four.*

L'gth.	Wire Gauge.	No. in 1 lb.	Wt. of		Price of		
			1 lb.	5c pk.	1 lb.	10 lbs.	100 lbs.
¼ in.	No. 21	17,500	2 oz.	.25	\$2.00	\$17.00	
¼ "	" 20	10,000	2 oz.	.20	1.50	13.00	
½ "	" 18	7,500	2 oz.	.15	1.20	11.00	
½ "	" 19	4,200	4 oz.	.12	1.00	9.00	
¾ "	" 18	2,700	4 oz.	.10	.85	7.00	
¾ "	" 18	2,350	4 oz.	.09	.80	6.50	
1 "	" 18	2,000	4 oz.	.09	.75	6.00	
1 ¼ "	" 17	1,200	4 oz.	.08	.70	5.50	

#### COMB-FOUNDATION MILLS.

We have the following second-hand foundation-mills, which we offer at the low prices annexed, to close them out.

Six-inch hexagonal, No. 1467. Price \$10.00. Suitable for extra thin foundation. In good condition.

Six-inch hex., No. 1461. Price \$7.00. This mill has had more use, but will still make good surplus foundation, and is cheap at the price.

Ten-inch round cell, No. T.T. Price \$10.00. This will make good medium brood foundation, and is in good condition.

Ten-inch, round cell, old style, No. V V. Price \$8.00. While this has had very little use, and is practically as good as when first made, it is quite inferior to our present make. For a small amount for home use it will answer nicely.

We have also a number of new 6-inch mills which are not suitable for extra thin, but which will make good surplus foundation; also, by adjustment, they would do fairly well for half sheets of light brood. We offer these to close out, at \$10.00 each.

We have also one or two 12-inch round-cell mills for medium brood, which we will sell at \$22.50, and one or two 14-inch similar that we offer for \$25.00 each. These mills are a bargain to any one who can use this style; shall be pleased to submit samples of the work of any of these machines to any intending purchasers who are interested.

I not only named, but first offered

Mastodon Corn  
Freeman Potato  
Prizetaker Onion

Tell Dr. Miller, as it is now winter back in Illinois, I think he might lengthen his Straw column, as I enjoy reading *Stray Straws* very much.  
**Encinitas, Cal., Dec. 5. J. M. CROW.**

Your last shipment of bee-supplies, October 6, is received, and merits praise for its workmanship. All the parts united nicely. I have them all put up and ready for the coming season, with the exception of some painting yet to be done. No mistakes in the parts manufactured so far. How can it be otherwise when "In God we trust" is the motto of The A. I. Root Co?  
**Bloomdale, O., Nov. 10. M. N. SIMON.**

The watch (\$8.85) I ordered from your catalog is at hand, though it must have been delayed, as I was on the point of writing you when it arrived. I have run it a few days, and it is a *dandy*. It is a much handsomer watch than I expected to see; and if, on further trial, it proves to run all right, it is a bargain for that money. Such a watch bought at the store would cost \$12.00. I know, for I priced them. I take pleasure in sending a money-order for the amount.  
**Montague, Mass., Sept. 29. F. C. FULLER.**

I have taken your little paper for lo! these many years, and like it much. It is always bright and sparkling, and never dull; and as variety is said to be the spice of life it must therefore be a spicy little journal. In it one may find discussed not only honey but fruit and vegetables; and last, but not least, it sets forth our duty to God as well as man. Well, I was always extremely fond of sandwiches; and what is better than honey, fruit, vegetables, and religion, with "Straws" for toothpicks?  
**Los Alamos, Cal., Oct. 8. JOEL HILTON.**

# Our TREES

Etc. advertise themselves. The best always cheapest Elegant catalogue, magazine size, 168 pages free. Gives the cream of the new and the best of the old in vegetables and flower seeds, fruit and ornamental trees, grapes, shrubs, roses, hardy perennials, bulbs, and greenhouse plants. Immense quantities. No finer assortment of fruits in America, with more acres of ornamentals than any other nursery can show. Nurserymen, florists, dealers and planters are cordially invited to call and inspect our stock. Seeds, plants, bulbs, small sized trees, etc. by mail postpaid, larger by freight or express. Safe arrival and satisfaction guaranteed. Send today for catalogue, free, it will save you money. 43d Year. 32 Greenhouses. 1000 Acres. **THE STORRS & HARRISON CO., Box 91, PAINESVILLE, OHIO.**

## Honey Column.

### CITY MARKETS.

SPRINGFIELD.—Honey.—Fancy white, 12; No. 1 white, 12; fancy dark, 10; No. 1 dark, 10. Demand fair.  
PERKINS & HATCH,  
Springfield, Mass.  
Jan. 11.

ST. LOUIS.—Honey.—Fancy white, 12½@13; No. 1 white, 11@12; fancy amber, 9½@10; No. 1 amber, 9; fancy dark, 7@8; extracted, white, 5½ in cans; in bbls., 5@5½; amber, 4 in bbls., 5 in cans; dark, 3½@4; beeswax, 23@25½. Stocks of honey not large, but the de and is very light except for low grade. Bakers take it.  
WESTCOTT COM. CO.,  
213 Market St., St. Louis, Mo.  
Jan. 9.

CHICAGO.—Honey.—Fancy white, 13; No. 1 white, 12; fancy amber, 11; fancy dark, 10; No. 1 dark, 9; extracted, white, 6@7; amber, 5@5½; dark, 4@4½; beeswax, 26@27. Demand not very active. Stocks light.  
S. T. FISH & CO.,  
189 South Water St., Chicago, Ill.  
Jan. 8.

CHICAGO.—Honey.—Fancy white, 12@13; No. 1 white, 11; fancy amber, 9@10; No. 1 amber, 8; fancy dark, 8@9; No. 1 dark, 7@8; white extracted, 5@7; amber, 5@6; dark, 4½; beeswax, 26 Comb honey sales are of small volume.  
R. A. BURNETT & CO.,  
163 So. Water St., Chicago, Ill.  
Jan. 7.

DETROIT.—Honey.—No. 1 white, 13@14; fancy amber, 11@12; No. 1 amber, 10@11; fancy dark, 9@10; No. 1 dark, 8@9; white extracted, 5½@6; amber, 5; dark, 4@4½. Beeswax, 25@26.  
M. H. HUNT,  
Bell Branch, Mich.  
Jan. 9.

ALBANY.—Honey.—Fancy white, 12@13; No. 1 white, 10@11; fancy dark, 8; No. 1 dark, 7@7½; white extracted, 5@6; dark, 4@4½. There is very little activity in the honey market, and an ample supply of dark comb and white. Fancy white is not plentiful. We expect an improved demand for extracted soon.  
CHAS. MCCULLOCH & CO.,  
Albany, N. Y.  
Jan. 8.

MILWAUKEE.—Honey.—Fancy white, 13@14; No. 1 white, 12@12½; fancy amber, 10@11; No. 1 amber, 9@10; fancy dark, 7@8; white extracted, 6@7; amber, 5@6; dark, 4@5; beeswax, 23@25. The demand for honey is not very good—sales seem to drag. We reasonably expect larger consumption at this season; hence, think it will come. The supply is very good, quantity and quality. Our quotations represent fairly the market, yet we realize some in order to push off stock and make sales reduce prices. We always try to maintain fair remunerat e values.  
A. V. BISHOP & CO.,  
Milwaukee, Wis.  
Jan. 7.

SAN FRANCISCO.—Honey.—Fancy white, 10@12; No. 1 white, 9@10; fancy amber, 7@8; No. 1 amber, 6@7; fancy dark, 5@6; No. 1 dark, 4@5; white extracted, 5@5½; amber, 4@4½; dark, 3@3½; beeswax, 24@25. Market is quiet, but stocks are not larger than requirements. Beeswax firm, but in poor demand and light supply.  
HENRY SCHACHT,  
San Francisco, Cal.  
Dec. 27.

BOSTON.—Honey.—Fancy white, 13; No. 1, 11 12; white extracted, 7@8; amber, 5@6; beeswax, 25. There is a fair demand with a full supply of No. 1 and off grades, but only a fair supply of fancy stock. Beeswax, light supply, and we advise shipments.  
E. E. BLAKE & CO.,  
Boston, Mass.  
Jan. 7.

CLEVELAND.—Honey.—Fancy white, 12@13; No. 1 white, 10@11; fancy dark, 8@9; extracted, white, 6@7; amber, 4@5; beeswax, 22@27. Honey continues to move very slowly. Living in hopes it will soon be better.  
WILLIAMS BROS.,  
80 & 82 Broadway, Cleveland, O.  
Jan. 7.

PHILADELPHIA.—Honey.—Fancy white, 13@14; No. 1 white, 12@13; fancy amber, 11@12; No. 1 amber, 9@10; fancy dark, 8@9; No. 1 dark, 8; white extracted, 6@6½; amber, 5; dark, 4; beeswax, 27. Little more call for comb honey.  
W. A. SELSER,  
No. 10 Vine St., Philadelphia, Pa.  
Jan. 9.

DENVER.—Honey.—Fancy white, 11; No. 1 white, 10; fancy amber, 9; white extracted, 5@6; beeswax, 25. Our market is still filled with dark and granulated honey, which tends to keep the price and demand down.  
R. K. & J. C. FRISBEE,  
Denver, Col.  
Jan. 9.

MINNEAPOLIS.—Honey.—Fancy white, 11@12; No. 1 white, 10@11; fancy amber, 9@10; No. 1 amber, 8@9; fancy dark, 7@8; No. 1 dark, 6@7; white extracted, 6@7; amber, 5@6; dark, 4@5; beeswax, 22@25. There is a ready demand for comb honey, and all sound unbroken lots sell readily on arrival. Extracted is slow, but nominally unchanged.  
S. H. HALL & CO.,  
Minneapolis, Minn.  
Jan. 9.

COLUMBUS.—Honey.—Fancy white, 13; No. 1 white, 12; fancy amber, 9; fancy dark, 7.  
THE COLUMBUS COM. & STORAGE CO.,  
409-413 N. High St., Columbus, O.  
Jan. 8.

KANSAS CITY.—Honey.—Fancy white, 13@14; No. 1 white, 12@13; fancy amber, 11@12; No. 1 amber, 10 @11; fancy dark, 10; No. 1 dark, 8@9; white extracted, 6; amber, 5@5½; dark, 4@4½; beeswax, 2@22. Sales are slow.  
C. C. CLEMONS & CO.,  
423 Walnut, Kansas City, Mo.  
Jan. 8.

FOR SALE.—Extracted buckwheat honey, in kegs of 160 lbs., at 4½ per lb.  
J. F. MICHAEL,  
Greenville, Ohio.

FOR SALE.—600 lbs. extracted honey, in new cans and cases, \$375.00. Speak quick; who wants it?  
ELIAS FOX, Hillsboro, Wis.

FOR SALE.—A carload of white extracted honey from basswood and willow-herb in 30-gallon barrels and 60-lb. cans. Purity and safe arrival guaranteed. Price, 6½ cts.; in quantity, 6 cts.  
FRANK MCNAY, Mauston, Wis.

FOR SALE.—Ten barrels good white-clover extracted honey at prices to suit the times. Can put it up in any style of package desired. Write for price, stating quantity wanted. Send stamp for sample.  
EMIL J. BAXTER,  
Nauvoo, Hancock Co., Ill.

FOR SALE.—15 boxes fine heartsease extracted honey. Price per lb., 6c. Also 14 boxes last season's honey at 5c a lb. Boxes have two 60-lb. cans each.  
JNO. A. THORNTON, Lima, Ill.  
eitt

## Dovetailed Hives.

Work for All. Send your address on a postal card to **HANDY MFG. CO.**, Detroit, Mich. They will tell you what to do.

# See what **NEW SUBSCRIBERS** are Offered.

New subscribers are what every journal most earnestly desires. As a matter of course, if the journal is good, most of the old subscribers will stay by it; but to get new subscribers, to get the journal into the hands of new men, that they in time may thus become old subscribers, is what every journal strives for most earnestly. To this end I make the following offers. For \$1.00 I will send the *Bee-keepers' Review* for 1897 (and throw in the December, 1896, number, which is especially good) and the 50-cent book, "Advanced Bee Culture," or, in place of the book, 12 back numbers of the *Review*. For \$1.50 I will send the *Review* and a fine, tested, Italian queen—queen to be sent early in the season of 1897. For \$2.50, the *Review* and 1000 No. 1 first-class one-piece sections. But, remember, these offers are only to those who are not now subscribers to the *Review*, and as a special inducement for them to try the *Review* at least one year.

W. Z. HUTCHINSON, Flint, Mich.

## It is here.

The year 1897 is here, and we are happy to inform our friends and customers that we are now better prepared than ever before to fill your orders for queens and bees. We have the largest stock ever operated by us, and we mean to be ready with plenty of bees and queens to fill all orders without delay that are sent to us.

Bees by the pound, \$1.00; ten or more pounds, 90c each. Untested queens for 1897, \$1.00 each in February, March, April, and May; \$5.00 for six, or \$9.00 per dozen. For larger amounts write for prices. Have your orders booked for your early queens. Safe arrival guaranteed.

Root's goods, Dadant's foundation, and Bingham smokers. A steam bee-hive factory, and all kinds of bee supplies.

The *Southland Queen*, the only bee-paper in the South, monthly, \$1.00 per year.

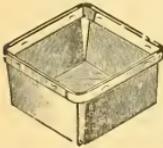

Send for catalog, which is almost a complete book on Southern bee-keeping, giving queen-rearing in full, all free for the asking. If you want full information about every thing we have, and the bee-book, don't fail to ask for our 1897 catalog.

The **Jennie Atchley Co.**,  
Beeville, Bee Co., Texas.

In writing advertisers please mention this paper.

Vol. XXV.

JAN. 15, 1897.

No. 2.

**STRAY STRAWS**  
FROM DR. C. C. MILLER.

THE HONEY-GEM recipe given on page 883 has been tried on a small scale at our house. I don't like it so well as the jumbles—too much taste of molasses.

IN REPLY to your question, Mr. Editor, I don't know of any objection to tall sections aside from not fitting supers; but then, I'm not acquainted with them.

BUCKWHEAT HONEY, as a food for bees, according to Herr Thiedemann, in *Centralblatt*, helps to prevent foul brood. I wonder if there can be any thing in that

J. B. KELLEN, editor *Luxemburg Bienenzeitung*, advises the use of pasteboard floors in hives in winter. Handy to draw out to clean the hive, without disturbance.

THE LEHIGH VALLEY is a railroad after A. I. Root's own heart. It not only prohibits the use of intoxicating liquors by employees while on duty, but tobacco also on passenger trains and at stations, and smoking in or about the shops.

WOOD STAYS wouldn't stay in brood-combs for R. M. Reynolds, p. 12. I reported exactly the same experience. Friend Reynolds, please tell us if you ever had any failure with stays boiled in beeswax. With such I've had success so far. But I use only one-fourth as much wood as you.

THERE IS a connection or relation existing between honey and buckwheat that does not occur to most people. The bees gather the honey from the buckwheat blossom, and the nectar is again returned to the buckwheat when it is eaten in the form of cakes.—*Farm Furrows, in Homestead.*

THE ANNUAL OUTPUT of honey in Europe is given in *Progres Apicole* as 80,000 tons, worth \$11,000,000, with 15,000 tons of wax worth \$6,000,000. Seems like a pretty big yield of wax, to get one pound to about five of honey. [These figures may be correct, but the amount of wax

seems to be rather larger for this amount of honey. See estimate of the annual product for the United States at the close of this department.—Ed.]

STOP YELLING about deep-cell foundation in the way you do on page 6, Mr. Editor, then stopping short just as we're ready for some disclosure. It's aggravating. If you've got scent of any thing worth while, tell. [Just have (*patients*), doctor. That is what a good doctor has, is it not?—Ed.]

HONEY VINEGAR in 14 weeks. Mr. T. W. Cowan tells in *British Bee Journal* how he makes it. Put in a cask 1½ lbs. honey to each gallon of water; add vinous ferment or common yeast; set in warm place; two months and three weeks from first mixing, clarify with isinglass, and in two weeks it's ready for market.

THE *British Bee Journal* says that the idea that Italians have longer tongues than blacks is now considered a fable, careful measurements showing no difference. [I suspect the *British Bee Journal* is right—at least, I doubt whether any living bee-keeper is any better able to decide this question than its editor, Thos. Wm. Cowan.—Ed.]

HERR GUENTHER has found, in 50 years' experience, that queens fecundated late in the season prove good layers, while those raised and fecundated early seldom last long. [This is a good point, if true. As long as there is a probability of it, so much is to be gained or lost that it would be a good idea for our American bee-keepers to experiment, and decide the point beyond a question or doubt.—Ed.]

PRES. N. E. FRANCE, at the Wisconsin convention, speaking of packages for extracted honey, said, "Some people advocate waxing the barrels to keep them from leaking; but my father says wax the cooper until he can make a barrel that won't leak."—*Amer. Bee Journal.* [Yes, I remember when I called on the Frances the old gentleman was very emphatic in saying that a barrel for honey did not need waxing. Their honey-barrels are made in advance, and

stored in a dry room. Just before the honey is put into them, the hoops are driven down solidly. Mr. France assured me that they never had any trouble from leaky barrels.—ED.]

TWENTY FIVE CENTS used to buy a corn-husker. Now the best machine for that purpose costs several hundred dollars. But think of the work it does! It takes the corn—stalks, ears, and all—as fast as two men can feed it, husks out the ears, and loads them on a wagon, then tears the leaves and stalks all to shreds, and carries them upstairs into the barn. And it never grumbles because there's no pie for dinner.

A MISTAKE occurs in that first recipe on p. 23. Instead of 3 lbs. it should be 10 lbs. lard. [Mrs. "Barney" made some most excellent honey-jumbles from the recipe given in GLEANINGS. I am rather of the opinion that the jumbles will be just as good with less lard—certainly much more wholesome. You know lard, or at least the excessive use of it, in cookery, is tabooed now by nearly all the medical fraternity.—ED.]

HONEY-JUMBLES. For the benefit of those who may want to try them on a smaller scale than that given p. 23, here's the recipe: 2 lbs. flour, 1½ oz. lard, 1½ lb. honey, 6 oz. molasses, ½ oz. soda, ¼ oz. salt, 1 gill water, ½ teaspoon vanilla extract. [It would be a good idea for you, doctor, to put all three of these honey-jumble recipes in your honey leaflet, then the family can pick out the size that will best suit its requirements.—ED.]

ONTARIO BEE KEEPERS at their convention raised the question of government's "compelling bee-keepers to put upon the market well-ripened honey." I don't like that sort of compulsion. If I've only enough honey for my own family I don't want to be compelled to put it on the market just because it's well ripened. But if it means I sha'n't sell unripe honey, that's all right. Why not a law against unripe honey just as much as against "unripe" veal?

FAILING TO FIND any thing else to fight with you about, Mr. Editor, I arise to continue the quarrel as to the time for development of a queen. Seventeen days is an old belief, and it is known that it is not now true and never was true. Fifteen days is found to be the truth under normal conditions, and is so put down in such reliable books as Cowan's. Now, what business have you to strike an average between that error and that truth, and then say 16 days is about right? [I just won't fight at all—simply give up.—ED.]

R. F. HOLTERMANN, of the *Canadian Bee Journal*, is stirring up things by trying to get Canadian honey on the British market—shrewdly giving members of the Ontario Association some advantage—and by getting a meeting of honey-vinegar makers and consum-

ers at the Toronto convention. [If Mr. Holtermann does not "look a little out" he will be stirring up the wrath of his British cousins. They do not take kindly to the importation of foreign honey into their market. What excites their indignation particularly is that the inferior grades of foreign honey have been sent to England and palmed off as English; but I presume the goods that Mr. Holtermann had in mind were first quality; but by a letter I have received from an eminent bee-keeper in England, it seems to be apparent that little if any thing, from a money standpoint, will be gained by the experiment.—ED.]

WISCONSIN reports for 1896 1,800,000 pounds of honey, and 20,000 pounds of beeswax. [These figures seem tremendously large, but they are within the range of possibility, for Wisconsin is certainly one of the very best honey-producing States in the Union. If every State averaged as well as this, then the total amount of honey would be 86,400,000 lbs.; but according to estimate made last fall (see Oct. 1st GLEANINGS), on the number of sections sold in the country, 50,000,000 (for both comb and extracted) would be a nearer figure. If this is correct, then Wisconsin produces 1 $\frac{5}{8}$  more honey than the average of the States. Indeed, there is no doubt there are single counties in Wisconsin that produce more honey than some whole States. But Wisconsin probably does not produce the largest amount of honey. California, by reason of its larger area, longer seasons, and greater variety of honey-producing plants, would run considerably in excess. I believe that somewhere rough estimates have been made as to the annual output for California, but I can not now put my finger on them. Granting it is in the lead, New York and Pennsylvania, and perhaps Illinois and Iowa, will each hold its own alongside of Wisconsin. But there are other States, such as Colorado and Arizona, that are rapidly coming to the front.—ED.]

PLEASE, SIR, Mr. Editor, what makes you box my ears for things I never did? On p. 7 you go to arguing about "sunken bottles" and things, and I never said a word about them. Go for Hutch. He's the "sunken bottle" man. Bless your heart! I'm for thin sections just as much as you, I suppose. What I'm fighting is the thievish plan of selling light-weight sections for full pounds. And I say if the grocer sells them that way, why shouldn't he buy them that way? [It is true, doctor, you may not have said any thing regarding the sunken-bottle matter; but what I was "boxing your ears" for was not that, but because you persist in saying the plan of selling thin sections is "thievish." I do not believe it is true that consumers have the idea generally that such sections weigh a whole pound; but 10 cts. is a nice even change; and if a section of honey is only

10 cts., people will buy it in preference to one that costs 15 or 18 cts. The dime is usually handy, and it is very easy to throw it out on the counter and walk off with the goods. The point that I think you overlook is this: Consumers are more apt to buy goods in ten-cent packages than in 15 or 25 cent sizes. That is the reason why manufacturers almost universally, where they can, try to put their products in such shape that they will retail for an even dime.—Ed.]

Then we have to get news from England about the uses of honey in our own national household.

The new Union evidently has a field here for the exercise of its talents, and a wide field it is, to find out where honey is used, for what purpose, how much, what quality, and at what price; and also where not used, and why.

Please tell Anthony Opp to desist from telling any more bear-hunting stories. They have a demoralizing effect upon Mr. Wilder, my friend and celebrated hunter. We prefer Mr. W. to stay in California; but that story, 18 bears in 20 days, leads him to cast longing eyes toward Arkansas. I have traveled with Mr. W. I know just how he feels—he feels for his rifle.

The fiber of the common nettle is attracting some attention as a commercial product. Nettle-farming might be a very profitable industry in this State, for they grow to an enormous size, and bees gather a good quality of honey from the blossoms. A nettle-farm and an apiary would work well together, and the bee-keeper would be perfectly at home with the stinging vegetable.

There is much said of late about drawn combs, and I should like to know just what is meant by that term. Must we understand that a drawn comb is drawn to the full depth of the cell, and ready to cap as we find it in an ordinary section? or is a drawn comb merely a piece of foundation started or drawn out half an inch or thereabouts? From my experience I can recognize the value of the latter, but I have never had good results from comb drawn full depth, or from which honey has been extracted. Furthermore, bees will not work upon a section with full-depth cells as readily as they will upon new foundation. The late B. Taylor recognized this fact, and hence the invention of his comb-leveler. Therefore, please state the most profitable depth of cell in drawn combs. [By drawn comb we have meant deep-

cell foundation, or comb with cells only  $\frac{3}{8}$  inch deep. Full-depth combs are not desirable or practicable for comb honey.—Ed.]

By R. C. Aikin.

#### ALFALFA-GROWING; ITS VALUE AS HAY; SOIL; IRRIGATION; A VALUABLE ARTICLE.

Since leaving my home at Loveland, Sept. 2, I have traveled through the territory just east of and parallel to the mountains nearly 200 miles. In that distance there is a large per cent of the country unsuited to bee culture because of lack of pasture. All that distance we were crossing the streams from the mountains that supply that district with water. For nearly 200 miles down the Arkansas River there is a strip of country from almost nothing to perhaps 10 or 12 miles wide that is partially irrigated and planted in part to alfalfa. Either side of the Arkansas River for many, many miles out from the irrigated strip, is a large territory covered only by buffalo grass, and would not support bees at all.

About the culture of alfalfa outside the irrigated land, it is somewhat experimental as yet, though it is grown in many places in a small way. I have found it in small fields in Eastern Nebraska and Western Iowa. A few days ago I saw a nice little patch in Page Co., Iowa, that was planted for hog pasture. It looked quite flourishing.

The alfalfa plant seems quite tender the first few weeks after it comes up, and then is the time it is most likely to be killed. In my own locality they usually plant it in the spring with spring wheat. The wheat does not come off till July, so the plants get quite well rooted by that time, but give no crop that year. The second year it will give two fair cuttings of hay, and the third year three cuttings. I suspect some have become discouraged because it is slow at the start. Do not give up and destroy it the first season unless it is *very* thin. Remember that the roots enlarge for two or three years, and that a two-year-old root will grow two or three times as large a head as a one-year old. Sow it in the spring with grain, and the next year it will begin to "get there."

Perhaps this will seem to many a large amount of space to devote to a description of country, irrigation, and alfalfa culture; but I think when you have read this and what follows, you will feel that it is important enough

to find a place in the columns of a bee-journal. There are many apiarists in the alfalfa regions, and nearly every one of them is familiar with honey-plants and conditions outside of alfalfa; but there are thousands who know little or nothing of the alfalfa districts and the habits of the plants. Within the last year or so the bee-journals have reproduced cuts of alfalfa as they appear in Mr. Frank Benton's recent work. These illustrations are good, and I doubt whether they can be much improved. I will now speak of the plant in relation to honey production.

#### ALFALFA AS A HONEY-PLANT.

I count alfalfa as an unquestionably good honey-plant. I think it will probably not yield as rapidly as many other plants do; but for reasons that will appear later, it is perhaps as much to be depended upon. I have now spent seven seasons in Colorado in the alfalfa districts. In that time I have taken two big crops, one fair crop, and the others poor to very poor. The best crop in the seven years gave a gain per day of about 4 lbs., with the best days only 6 to 8 lbs., and such days *very* few. The average seasons the gain per day has been from 1 to 5, a gain of 4 and 5 lbs. limited to two or three days. In the poor seasons we could hardly get a gain of 4 lbs., the usual run being one to two per day. Why it is that the yield is so slow I do not know; but my observation so far shows that to be a characteristic of the plant. I have never known pollen to be gathered from alfalfa; and when the yield will give a pound and a half per day there is no pollen to speak of carried in from any source.

As explained in the former article, there is but little rainfall in Colorado except in mountains. This naturally gives much clear sunny weather, so that the bees can work almost every day. The nights are cool, as a rule, and possibly this is one reason why the daily gain is light, for the bees do not get out as early as when the nights are warm. There are some conditions under which the plant will not yield, though the bloom be full and apparently healthy and vigorous. The two seasons just passed I thought I should have a good flow, for the bloom was abundant, apparently the best for several years; yet this year (1896) the crop was the lightest in seven years, being almost a complete failure so far as surplus was concerned.

I have noted that some who have patches of alfalfa in the East report that the bees do not work on it. Mr. Hagan, of Rocky Ford, Colo., says his experience is that, on dry ground—that is, unirrigated, and of course suffering for moisture—there is very little nectar gathered. Some others also report no nectar upon non-irrigated land. I can not believe that these adverse reports are at all conclusive. The reports from the East are very limited, and possibly there was other bloom in greater

quantity at the time which would naturally take the force. The fact that the non-irrigated fields in the West do not yield would be perfectly natural. We can not and do not expect any plant to yield when not in prime condition.

Irrigation, it seems to me, to some extent overcomes some weather conditions. The natural condition of weather in Colorado would be clear and dry, which would soon result in a complete stoppage of nectar secretion; but to turn on a refreshing stream of water until the moisture permeates the ground and all about the roots, it seems to me ought to produce nectar secretion. Clear, warm, and sunshiny above, and plenty of moisture beneath, is a condition we find present in some degree at all times here. Some water is being applied every day in the honey season, so that *some* fields ought to yield, even though a neighboring field be too dry. So far as I know, irrigated districts never have a complete failure of nectar there being sufficient to give winter stores if no more. I believe that alfalfa would yield in the East, and would be worked by the bees, if it were extensively cultivated. However, it does not seem to be a special favorite with the bees so as to attract them regardless of presence of other bloom. Sweet clover yields both honey and pollen, and is for some reason an especial favorite with the bees. It will be visited when in bloom, no matter what else is open; but alfalfa yields no pollen, and is not particularly attractive to the bees, and consequently does not make a showing when other bloom is more abundant.

As I have previously shown, there is a very large territory in Colorado that does not grow alfalfa. More than this, where it is grown, but a small per cent only gives pasturage. The first hay crop (I speak of the territory north of Denver, more southern latitudes come in earlier) is cut in June, just as the crop begins to bloom. This hay is generally counted on for horse feed, being rather coarse. The second growth is cut just before blooming, or at the very beginning of the bloom, is not quite so coarse as the first growth, and makes good cow hay. The third growth does not usually reach bloom, but is cut at the close of the season, making the finest and most watery or washy hay of the three crops, and is by many counted the best of the three for milk, but entirely too "soft" for work-horses.

In the rotation of crops, alfalfa meadows are broken and planted to wheat. Wheat and alfalfa are the main crops. The thick, tough tap-roots that go straight down into the earth are very hard to cut off; hence in plowing up these meadows so many of the roots slip by the plow, or for some reason grow again, that often a wheat-field will have in it a fair stand of alfalfa. Wheat harvest does not come for a month or more after the alfalfa begins to bloom, thus there is quite a little pasturage

for the bees from that source where such fields exist. Here and there will be fields grown for seeds. For a seed crop they prefer a field not too thickly set and not too wet. The scattering plants grow great spreading bushes, as it were, a single plant often occupying a circle of three feet in diameter when not crowded by others. These seed fields will be in bloom from one to two months, like the sweet clover, having both bloom and ripe seed at the same time, though not so much so as the sweet clover.

Now observe the foregoing conditions, and you will see that the simple presence of alfalfa is no guarantee of pasturage. There is always some in fence-corners, on roadsides, ditch-banks, and other out-of-the-way places that matures bloom; but aside from this it depends upon the use made of the crop, and whether the farmer is "up with his work" and cuts promptly, what amount of pasturage the bee-keeper gets. So far as I know, the conditions here described are in the main true of alfalfa districts in general, though there may be some conditions that change the details somewhat. The Arkansas Valley is nearly 200 miles further south than Loveland, and has a season almost if not quite a month longer. There is also quite a difference in the soil and water supply. Much more seed is also grown there than in my own territory, hence it is at present a better field for honey than my own. Water supply, soil, demand, whether for seed or hay, etc., determine whether seed or hay be grown, and these bear upon the pasturage question.

---

#### OUR GRADING-RULES CRITICISED AGAIN.

FOOLISH FADS IN GRADING; SHIPPING-CASES, AND SNOW-WHITE SECTIONS.

By B. J. Thompson.

In GLEANINGS for Oct. 15, pages 758-9, you have a short article on B. Walker's opinion of the rules of grading honey, and call for an expression of the opinion of your readers.

I heartily agree with Mr. Walker in his opinion as stated in that article, that "all of the grades are too strict over unimportant details." In GLEANINGS, Dec. 1, page 864, the editor speaks of the snow-white dress for sections and shipping-cases as a "foolish fad, and the sooner it dies out the better." Now, it seems to me if the demand for snow white sections is a foolish fad, then a set of grading-rules which demand that "both the wood and comb shall be unsold by travel stain or otherwise" is a "fad" and a very foolish one at that, and especially so when it is next to impossible to obtain honey that will fill the requirements of those rules.

In all the years of my bee-keeping I can not remember of having any honey that would exactly fill the present rule for "fancy," and very

little No. 1; and yet every dealer who has ever handled my honey has given me credit for having as fine lots of honey as he ever handled. (I do not write the above to boast, but to show why I think the present rules of grading too strict and unjust.) If a person can secure a crop of "snow-white" honey, all right; but to make a grade of that kind when such crops are the exception instead of the rule is not just to the large majority of bee-keepers.

White honeys are not all of the same degree of whiteness, if such an expression is allowable; and some seasons the honey can be secured in whiter, nicer shape than others. Both of those factors should enter into the consideration of a set of grading-rules, to be just to all in all parts of the United States.

If sections that are not snow-white are just as good as the snow-white (and I can not see any reason why they are not), what possible harm can there be in having travel or propolis stains on the wood, provided they are properly cleaned? Furthermore, I can see no detriment to the comb being slightly discolored even for fancy grade. The fancy grade calls for "All sections to be well-filled; combs straight, of even thickness." When a section is "well filled, comb straight," I can not see of what use the condition "of an even thickness" is, unless it is a point in favor of those who use separators. (I use 7-to-foot sections without separators.) If a comb is straight, and sections well filled, the condition of "an even thickness" is unnecessary, and only gives the purchaser a chance to be more particular, or find fault if he chooses.

Let us have a careful revision of the grading-rules, and let them be such that they will be a good practical guide to honey-producers. Give us something practical, and that we can use, even if some points have to be left to the decision of honey-producers in various parts of our country. The practical bee-keeper's good common sense will not let him go very far astray.

Waverly, Wis., Dec. 7.

[I believe all that you and friend Walker say is true. Acknowledging, then, that our present rules are faulty, what we need to do is to set them right. I wrote to friend Walker, asking him to submit to us another draft of the same rules, with all the objectionable features eliminated; but he was so crowded with work that he could not get to it. I therefore call upon you, friend T., to take them and redraft them. You have both the experience and ability to do it.]

The *scheme* of our present rules is excellent, and all we need to do is to lop off some of the impracticable or impossible requirements. A slight change in the wording here and there will be all that is necessary, in my judgment. I said the *scheme* of the present rules is all right—that is, having several grades, such as "Fancy," Nos. 1, 2, etc., and then designating the source by "White," "Amber," "Dark," etc. Our commission men and bee-keepers have become used to the present rules, and, so far as possible, we should retain these features.—Ed.]

## FOREIGN BEES.

LITERATURE RELATING TO BEES IN BRAZIL,  
EAST INDIES, AND AFRICA; GOVERNMENT  
AID TO BEE-KEEPERS.

By W. K. Morrison.

It seems that many of your readers want to know more about the foreign bees mentioned by me previously, so I shall add a little to what has already been said, to reinforce some of my former statements and show what has so far been discovered. We will start first with South America.

Capt. Hall, in the account of his travels in the southern continent, gives a most minute account of the keeping of stingless bees by the natives; but as this book is easily accessible I will pass it by now. The same may be said of Capt. Beechey. The works of Azara and Geoffrey St. Hilaire are not common, and I have not seen them for some time; but Azara had a good deal to say about the bees of southern South America, and first mentioned the now celebrated honey-gathering wasp. The Europeans said that Azara was either fooling or had been imposed on; but Azara held his ground, saying he was not mistaken. Geoffrey St. Hilaire was able, however, to corroborate all that Azara had said, and there the matter rests. Spix and Martins, the great explorers of Brazil, seem to have come across honey-bees of different sorts. Their book costs so much (\$170) that I have been unable to get to see it. Bates, the author of that fine book, "A Naturalist on the Amazon," mentions the fact that he saw a native take two quarts of honey from a nest of *Melipona fasciculata*. He says that the hive consisted of an immense number of individuals. He further says that they work pretty much as ours do, only they seem to use mud instead of propolis. They have no sting, but their bite is nearly as effective in keeping off intruders. The largest size he saw was a little less than our bee. I have tried to get these bees from British Guiana, but without success.

Mr. Paul Marcoy, who has written one of the finest books of travel ever penned, mentions bees. He is an artist, a naturalist, traveler, and ethnologist all in one, and, as might be expected, his book is a model (Blackie & Sons, Edinburgh). Here is what he says:

"Two kinds of wax are collected by these *Sensis*—a white and a yellow. They have a third kind, black; but as they obtain it by mixing lampblack with the natural varieties, we may pass it by. The white wax is produced by a bee called the *mitzqui*, the yellow by the *yacu*. The first of these hymenoptera is not larger than a small fly; the second is about the size of the common bee. The habits of the two insects are similar. They establish themselves in the hollow interior of cecropias (a tree), which are almost always pierced where the

branches spring from the trunk, selecting by preference such of these trees as grow around the lakes of the Ucayali (between Sierra Blanca and Nauta), rather than those on the banks of the great river. This preference is accounted for by the tranquility which they enjoy in the interior of the country, where the waters are rarely furrowed by the canoes of the natives. To possess themselves of the wax and honey of these bees, the *Sensis* set a light to a pile of green wood around the cecropia, to which they have tracked them, and, after having dispersed, suffocated, or burned the laborers, they fell the tree and appropriate the fruits of their industry."

My own opinion is that the *Melipona* would succeed where moths and ants are troublesome, and it is generally considered that the difference between them and *Apis*, structurally speaking, is very slight. They would seem by all accounts to be good wax makers. I have seen several species, but never a nest of the large kinds. The honey of the small kinds is very good, and most of the bee-hunters of Venezuela prefer it to our own kind.

In regard to the East Indies, we are well off for information. Many travelers have touched the theme. Dr. Alfred R. Wallace, the friend and collaborer of Darwin, has given us a most graphic account of *Apis dorsata*, that leaves little to be desired. You will find it in his well-known book on the Malay Archipelago.

Here is what Forbes says in his "Naturalist's Wanderings" about *Apis dorsata*:

"During the brief twilight, after the sun had disappeared, the air for some twenty minutes was suddenly filled with the hum of bees (*Apis dorsata*) as if a swarm had alighted among the flowers of the gum-trees. Just before daybreak, while it is still dusk, the morning air is in a similar manner inundated with their noisy hum. This singular habit of these bees in feeding in the sunless hour of the morning and evening I was totally unaware of till I came to live at Fatunaba, where, close to our door, a grove of these trees grew. In the evening the *melaleuca* (a fine honey tree) certainly becomes more fragrant than it is at mid-day; but I could not ascertain what would be very interesting to know, if its flowers exude their nectar or shed their pollen more freely late in the evening and early in the morning."

This query is easy enough to answer. The rays of the tropical sun bear down so directly as to dry the nectar out of the flowers by 10 o'clock A. M. Moreover, there is hardly such a thing as twilight in the tropics, and bees soon get to know that, when the sun goes down, there are only a few minutes left to get their fill and fly home, otherwise they will have to stay out all night, so they troop home just as they do when a shower is coming. Again, during the night the flowers collect more nec-

tar; and as the sun rises all at once, the bees simply "swarm" to their work and "make honey while the sun is obscured by morning mists." That keen observer, Mr. F. W. Burbidge, in his "Gardens of the Sun," gives us a short but excellent account of the apiaries he saw in the East Indies. He says:

"Here at Kian, as at all the Dusan villages along our way, we noticed large quantities of tame or domesticated bees. These are kept in cylindrical hives formed of a hollow tree-trunk, and are placed on a shelf fixed under the overhanging eaves of the houses. In several instances the hives were on shelves inside the houses, a hole being made through the "ataps," corresponding with the hole in the hive, so as to allow egress and ingress—a plan similar to that adopted by the bee-keepers of Kashmir." Who says the house-aplary is something new? It is certain the bees seen by Mr. Burbidge were not *Apis dorsata*. What were they? And yet there is no more wide awake man in the world than the gentleman just mentioned.

Next on our list is Africa, and one quotation will do for this continent. In "Through the Kalahari Desert," by Farini, he has this little narrative:

"'Are you sure, Klas,' said I, 'that it is a bees' nest and not a wasps'?'"

"'Yes, Sieur, it is a bees' nest, and there is plenty of honey. I'll show Sieur where it is, and then he can see for himself. We find them in aard-vark holes and clefts of rock in the mountains, the comb quite open, and the bees clustering outside.'"

"This was something so entirely new to me that I made Klas take me next morning to the spot, while the Bushmen organized a bee-hunt. Taking a little water in a broken ostrich-eggshell they placed it near a bunch of flowers, and watched for the bees coming to drink. The thirsty insects are always on the outlook for water; and as soon as one finds it he quenches his thirst and goes off to call his friends and neighbors to the spot.

"It was not long before first singly and then in twos and threes, and lastly in dozens, the bees came and settled on the top of the eggshell, which one of the Bushmen then took up and held aloft as he slowly followed the direction in which the insects took their flights, the thickest of which the water-bearer followed, while others were told off to track out the others. This was now no very difficult task, for the bees were so thick that their flight could be traced by the sound of their humming.

"At last we came to a wait-a-bit bush, round which clustered myriads of bees, just as if they were 'swarming' there; but the Bushmen said there was a comb inside. They did not take any notice of us; so, after watching them for a bit, I took a bunch of grass and set fire to it, causing a dense smoke to arise under them.

This had the desired effect. Those outside became stupefied and fell down, while the others, filling themselves with honey, offered no resistance as I reached carefully into the bush so as to avoid disturbing them, and at the same time to prevent the terrible thorns from tearing my hands. The combs, seven in number, hung crosswise from the branches—the middle ones the longest, and the others growing shorter the nearer they came to the outside. Both comb and honey were as white as snow. It must have been a young swarm, as there were no young bees, and the comb was new, never having had brood in it to discolor it. I gathered up some of the bees and put them in a reed, but, unfortunately, was not able to secure the queen."

Schweinfurth noted that the bees in Central Africa were closely related to the Egyptian race. Slatin Pasha, who has recently escaped from Khartoum after ten years' imprisonment, says in his new book, "Fire and Sword in the Soudan," that one of his carriers was killed by bees he attempted to rob. He says the poor fellow died in great agony. I suspect that Africa is the original home of our bees; and, in fact, it is extremely likely, since the modern anthropologists are pretty well agreed that Africa was the home of our race, though we used to be told once that we were Asiatics. Has the bee followed us in all our wanderings?

Now as to government aid to bee-keepers. I for one am not opposed to it; but we must be careful. The hunt for new species alone would furnish a great chance for a number of junketings and also a lot of nonsense. We shall have to get a very much better administration of the Agricultural Department than we have had heretofore; in fact, I distrust their ability altogether. Why is the apicultural division put in with the entomological department? Scientific men generally class bee-keeping as belonging to botany; that is, the fertilization of flowers. The botanist can tell us more news than the entomologist. Hermann Müller and Darwin have placed this beyond the shadow of a doubt. Pasturage is the great problem of the future. But this is another story.

I think if the government were to give the Smithsonian Institute a grant of money for this object for a term of years, it would satisfy everybody, the money to be granted on the express purpose of making experiments on the different species of bees, and their influence on flowers. The Smithsonian could attack this job better than any one else, and, moreover, get the assistance of the whole scientific world. They would be able to see the job from all sides. Still, there would be plenty left for the Agricultural Department to do, such as gathering statistics, getting uniformity among hives, promoting the sale of honey, and so on.

As to getting new bees, the Smithsonian can

do it better than any one else, and at less expense. We can keep our weather eye open.

There are many other references on bees in modern books of travel; in fact, some just published mention them, like Lawrence's Kashmir, where the bee-men know enough to feed millet meal for pollen, and keep the hives inside; but enough has been noted to show how matters stand.

Devonshire, Bermuda.

### DEFUNCT BEE-JOURNALS.

THE FIELD OF BEE JOURNALISM IN GENERAL;  
IS IT A BAD POLICY WITH THE OLD RELIABLES  
TO BOOST ALONG NEW RIVALRY?

By Dr. C. C. Miller.

Some time ago a friend of C. J. H. Gravenhorst, the able editor of the German illustrated bee-journal, applied to the latter for a list—for what purpose I don't know—of bee-journals that had started and had ceased to be published. After making up a rather long list of such journals that had lived and died across the water, Mr. Gravenhorst referred to me to give a list of such American journals. I in turn asked help of the inhabitants of Medina, and it has occurred to me that it might not be a bad thing to make some sort of permanent record of this list before some of the names are entirely forgotten, and possibly the few not here given may have their names supplied by some one else. Here is the list, so far as I can give it:

	Began.	Discontin'd.
<i>Bee-keepers' Magazine</i> , -	1873	1889
<i>Moon's Bee World</i> , -	1873	1877
<i>Bee-keepers' Guide</i> , -	1876	1890
<i>Bee keepers' Exchange</i> , -	1879	1883
<i>Western Honey-bee</i> , -	1879	1880
<i>American Apiculturist</i> , -	1883	1895
<i>New England Apiarian</i> , -	1883	1884
<i>Kansas Bee Journal</i> , -	1884	1885
<i>Bee-keepers' Advance</i> , -	1889	—
<i>The Bee-hive</i> , -	1893	1893
<i>National Bee Journal</i> , -	—	—
<i>Canadian Honey Producer</i> , -	—	—
<i>The Queen</i> , -	—	—
<i>California Apiculturist</i> , -	—	—

The above list of the dead considerably outnumber the list of the living. Old age was not the cause of death, the oldest being the first on the list, and that died when only "sweet sixteen," while GLEANINGS shows no signs of decrepitude as it enters its 25th year; and the only older one, first-born of all, the *American Bee Journal*, which first saw the light in 1861, 36 years ago, was never in so full vigor as now.

Bee-keepers are likely to be enthusiasts, and once in so often enthusiasm leads to mania. Sometimes it's a mania for invention. Indeed, like the chickenpox and measles, every bee-keeper must go through a more or less severe siege of this mania for invention. Possibly there's a defect somewhere in the make-up of a bee-keeper who never thought *he* could invent

a hive. Then there's the mania for entering the list of supply-manufacturers and queen-breeders. For a considerable time I have been conducting a department in the *American Bee Journal* in which I attempt to answer all sorts of questions about bee-keeping, and you would be surprised to know how often it happens that questions of the most elementary character, showing that the man has neither knowledge nor experience, come from one whose card on his envelope proclaims him "Breeder of Choice Italian Queens." Not long ago I had a letter reading somewhat after this fashion: "I began this year for the first time with 6 colonies, and increased to 16. Next year I intend to increase to 75, and to go into the business of queen-rearing." He may not get his 75; but the probability is that the list of queen-breeders will be increased by one more. But what kind of queens?

The mania for publishing a bee-journal comes later in the life of a bee-keeper, is not so widely spread as other kinds of mania, but more disastrous in results. The victim is cured of his infatuation only at the expense of a goodly number of dollars, belonging either to himself or to some one else. It seems a little strange that men of bright parts and apparently good judgment should be deceived into making a losing venture in plain view of the wrecks of the majority that have preceded him. Probably the allurements are not the same in all cases. In many cases a new journal is started because of apparent local needs. The bee-journals already in existence fail to fit the needs of the county in which I live, in some particulars. What's the use of occupying space with talk about sage and alfalfa honey, when there's nothing of the kind within hundreds of miles? So it will be the wise thing to have a McHenry Co. Bee Journal, in which the wants and needs of McHenry Co., and of McHenry Co. alone, shall be considered. But when I come to start the paper, which at the utmost could have only 500 to support it, and get only 100 of the number as actual subscribers, the thing begins to look different. True, I had all sorts of encouragements from every one whom I consulted. "Just the thing, and you're the man to take hold of it." Why couldn't some have the courage, the true kindness, to say to me, "The field's already overworked. Others have lost time and money by it, and the chances are greatly against your success"? It might be a good thing for the bee-keepers of Ohio if they could have an able journal devoted entirely to the interests of their own State; but the field is so limited that Ohio bee-keepers will do better to join hands with Alabama, California, and other States, in supporting one or more journals of more general character.

In some cases a bee-journal comes to the birth, not because of a crying need for it, but because the would-be editor recognizes in him-

self a born fitness for editorship such as doesn't yet exist. There is a lack in bee-literature. The bee-journals already published are not what they ought to be. He will give the fraternity just what they need, something progressive, and not keep thrashing over old straw from which the grain was winnowed years ago. But after he has fairly launched on the sea of journalism, it begins to dawn on him that, in spite of his great talent and peculiar fitness, bee-keepers can not be made to see it in the same light, and will still persist in being satisfied with the old standbys. Subscriptions do not pour in as he anticipated; and as something more than two or three hundred subscribers is needed to pay for setting the type, to say nothing of ink and paper, there's nothing left to pay for editorial labor; so, after the struggle of a few months or years, the project is given up, and the brilliant journalistic talents allowed to rust because their owner was born in an unappreciative age.

Bee-journals already established are themselves to blame somewhat for some of the disappointment and loss resulting to those who never should have entered the field. Not to appear underhanded in my accusations, I will arraign GLEANINGS on this charge. Now stand up in a straight row, Mr. Editor, listen to my charge, and see if I don't tell the truth. There comes the initial number of *The Front Rank Bee-keeper*, and you feel that you must give it a free advertisement. If you don't, the publisher feels defrauded of his natural and inalienable rights, and does not hesitate to mention in print the mean spirit you have shown. Now, what kind of business policy is that on either side? Suppose Smith starts a store in a new place where Jones has been for years the leading merchant. Jones rushes to the newspaper office and pays for the "ad" that Smith has had inserted. Some might praise Jones for his courtesy, but more likely he'll be called a fool. Merchants don't do business in that way. Is there any reason why the code that prevails among rival merchants should not prevail among rival papers?

You may say that, whether the code should be the same or not, the fact is that it is *not* the same, and that it is only newspaper courtesy to make kindly mention of a rival enterprise; at least, if it is not common courtesy it is sometimes done, and it's an act of kindness to mention favorably the new candidate for public favor. I beg pardon, it *isn't* kindness; at least, it generally isn't. In your heart you know there isn't one chance in ten, if in a hundred, that the venture will be profitable, and the sooner the publication stops the less will be the loss. But your words of commendation — and you try to commend all you can without lying — help to keep up hope; for if an o'd journalist approves, there is certainly no reason for discouragement.

Then, too, your mention makes more or less call for sample copies, and possibly a few subscriptions are sent in just on the strength of your recommendation. So you have helped to keep up the delusion just a little longer, and what good have you done? — merely helped to prolong the agony in a case where you were almost sure death must inevitably come. Better let your silence help to kill it the sooner, and thus end its misery.

Marengo, Ill.

[When you asked me to furnish you a list of the bee-papers that had once lived and died, I thought perhaps half a dozen would very nearly cover the number; but when I came to look over our back volumes, representing all the bee-papers, both living and dead, I was surprised that the list should be so large. Surely, in the bee-journal line also the dead greatly outnumber the living.

There were some bright progressive men who were at the editorial helm of some of these bee-papers — men, too, of experience in the publishing business. If *they* have made a failure of it, those with no experience who are contemplating embarking in such a doubtful enterprise would do well to pause long enough to never embark.

With all the experience the editors of the old existing bee-journals have had, it is doubtful whether, if they were to sever their connection with their papers, they would be able to start another bee-paper that would live and pay expenses. The fact of the matter is, the old reliables have come to be so thoroughly entrenched that the new rivals have almost no chance whatever — at least, that list of the dead as compared with the living seems to look decidedly that way.

The trouble is, the number of bee-keepers in the country is comparatively small; and among that list the number who take a bee-journal or bee-journals is smaller still. We have on our books something like 100,000 names of *bona-fide* bee-keepers. Of this number, not over 12,000 take any bee-paper. As a general rule, one or two bee-journals seem to be all that they will take. What show is there, then, for a new candidate, without experience, without much capital, without the coterie of experienced writers, to go in and divide that patronage, especially when the price charged is often equal to that asked by the stand-by existing journals?

In saying this I am not trying to throw bricks at new bee-papers over the shoulder of Dr. Miller; neither am I afraid they will cut down our patronage, for they have not. Indeed, our circulation, until these hard times came on, kept right on at its old pace the same as *before* the rivals were in the field; and even now it reaches very close on to 8500.

Well, doctor, since you have asked me to stand up in a straight row I shall have to confess that, when GLEANINGS has acknowledged the arrival of a new rival, it has done so purely out of editorial courtesy, and because it would have looked mean, as you intimate, to ignore its appearance upon the field; but I believe, as you say, that it is not courtesy nor a kindness. For instance, suppose that the old established journals had refused to recognize the initial numbers of many of the above defunct list; the probabilities are they would have died sooner, and thus saved their publishers a considerable amount of money. Whether those same publishers would have appreciated that at the beginning is very doubtful; but if living now, I am sure they will realize the truth of it as they never saw it before.

### WOLVES AND WILDCATS.

SOME "LIVELY" EXPERIENCES.

*By E. France.*

Forty-one years ago this winter I went from the State of New York to live in Iowa. I was then 32 years old. I settled on the east bank of the Des Moines River, 27 miles above Ft. Dodge. There were very few settlers there at that time. I took up a quarter-section of government land, built a log house, and worked on the farm summers and trapped winters. Wild animals were plentiful there at that time.

The first and second year that I was there we had very hard winters—cold, and deep snows. The wolves hovered around the settlements in hopes to get something to eat. I would see them almost every day—single, or two or more together. At one time I saw 13 in a drove. At another time I wounded a deer just at dusk, but did not get it that night. I went the next morning to find it. I found its bones, but all the meat was gone. Away from the bones ran a troop of wolves and foxes. They ran across the narrow river bottom and up on the grassy bluff, then stopped to look. I counted 32 wolves and a few foxes, so you see there were plenty of wolves in the country. Were they dangerous to human life? Not much danger from a single one; but when in packs they were a little risky.

There were five persons killed by them in Iowa in the winter of 1856. But the trappers soon thinned them out.

The second winter that I was there I got a little scared one night when I was trapping up a creek near my place. I would go up as far as I could, and get home in one day. I wanted to go farther up the creek, so I took some bed-quilts and something to eat, intending to go up as far as I could, stay over night, and come back the next day. I went up about 15 miles. The upper part of the creek was all prairie. After I got above where I had trapped I found a large beaver settlement among the ponds. There were three quite large willow-trees, about 25 feet high. I thought that would be a good place to camp near those trees. In case the wolves got after me in the night I could climb the trees. But I had a few traps yet not set, and I wanted to see more of the creek further up; so I went on up five miles further, and got all of my traps set. Then by the side of a beaver-pond, in a little clump of small willows, I fixed my camp. I cut with my knife a large bunch of dry grass for my bed, wrapped my blankets about me and lay down to sleep, and was soon dreaming about wolves gathering to devour me. I woke up, and, sure enough, the wolves were howling in every direction. I was sorry that I had not stopped down by those three willow-trees. In fact, I was quite uneasy. But I could not reach the

trees now, and made up my mind to stand my ground. This was in November. The ponds were not frozen over, and the grass was not burned off. I had no gun, but had a good hatchet and knife, and a big dog. I could set the dry grass afire if I must, but did not want to if I could help it. The wolves came nearer, and appeared to be more of them. The dog growled and barked. Pretty soon the wolves stopped howling. Were they sneaking in on me, or had they given up the job? I lay there. The moon came up. The dog went to sleep, and so did I. I heard no more of the wolves. I got up at daybreak, ate my breakfast, and started down the creek to see my traps. The first trap I came to, set for a mink, baited with beaver-meat, had a wolf in it. I skinned it, and skinned three more near there. I have thought, since then, those four wolves getting trapped that night saved me, or, at least, saved me a fight with them. I stayed in my camp there several nights after that, but was not disturbed again.

The next winter I trapped on the same creek again, but had a horse to ride, and many a chase I had that winter after wolves on the prairie—not much snow. My dog was a large half-breed grayhound, and liked the sport as well as I did. The horse was a good runner, and liked the fun too. The wolves would be lying in bunches of unburned grass; and when I came near they would start out, then here we would go. I seldom ran over a mile—usually not over half a mile. The dog would stop the wolf and fight him. I would come up soon, and with my hatchet finish the wolf, skin it, and then go on. Sometimes the horse would see the wolf first. He would then jump ahead so suddenly that I would be thrown back behind the saddle; and once I remember I went clear back over the horse's tail on to the ground. I alighted on my feet, but was soon in the saddle again in full chase after the wolf.

I will tell you a little laughable story of a wildcat capture. I was trapping on the Little Sioux River in the winter time, in company with a young man. We had caught several cats in our traps. One day, after a little fall of snow, we were walking up the river on the ice. We saw a cat's track going up the river, and we followed it. It went straight up the steep bank of the river, and went into a hole under a cottonwood-tree. As I had a trap with me I went up to the hole to set it to catch the cat when it came out. I had my gun in my hands, and I poked the muzzle into the hole, and put my head partly into the hole to see what I could see in there. It so happened that the hole went back only about six feet. The cat was back in the further end. It being dark in there, or may be I was snow-blind, I did not see the cat at first; but soon my eyes began to see, and just then I saw two bright eyes, and heard a

deep growl. I knew the cat was coming out, and there was hardly room for it to pass my head. I had my right hand on the gun-lock. I raised my head and gave the cat a "snap shot." The ball struck it in the breast and killed it. But in her spring to get out she landed on my left shoulder, bleeding like a stuck hog. My dog, always at my heels, bounded up and grasped the cat, and also got my coat collar in his mouth. Being a heavy dog, and stout, he took cat and hunter down the steep bank on to the ice, and tore half my coat off. There we were, hunter and dog, cat and gun, all whirling around in the light snow. The blood from the cat was all over in the fresh snow. My partner was terribly scared. He got hold of me as soon as he could, and helped me up. He did not stop to see that the cat was dead. He thought I had shot myself, or that the cat had hurt me. He thought all the blood was coming from me. I just looked and laughed, and examined myself, and found that I was not hurt.

"Well," said my partner, "if that is the way to capture wildcats, you can have all the fun to yourself. I don't want any."

The wild cat is a pretty savage chap if you get it cornered, but usually very shy, and will keep out of your sight if it can. If caught in a trap it is ready to fight if you give it a chance. Walk up to one in a trap, and it will come toward you as far as the trap-chain will reach, and stand ready to fight, and growl like a big dog. I take my hatchet in hand, go up as near as I can and be out of reach of its paws, then make a few false blows near it, with the hatchet, as soon as it will let you do that without striking back at you, then reach a little further, and hit it on the head. It is not hard to kill. A quite small blow will drop him.

Once saw one that was tamed. It was taken when very young. It was four years old when I saw it. It was a great pet, and appeared to be as safe a playfellow as any other cat. There was a four-year-old boy in the family, and boy and cat were great friends, and played together, rolling and tumbling about the floor, sometimes the boy on top and sometimes the cat. The boy would pull the cat's legs, and get his hands in its mouth, but the cat did not bite or scratch him. But let a strange dog come around the house, and the cat would bounce on to him and comb his hide in good shape. Very few dogs can whip a wildcat.

My story is getting almost too long. I was intending to write up some of my adventures with wolves in Wisconsin, but will leave that for another chapter.

Platteville, Wis.

[Some time ago our friend Mr. France wrote us, asking if a wolf-story or two, drawn from his own experience, would be acceptable for GLEANINGS. I replied that it would, that variety was the spice of life. He is one of the old

pioneers, and one at whose feet it is a pleasure to sit and listen. As I know by experience when I visited him, he is full of the experiences of pioneer days; and if what he says does not relate to bee-keeping, it is a bee-keeper of no mean order who is telling the story. If our readers do not like such "diversions" let them speak out.—Ed.]

#### A NEW SYSTEM OF TAKING COMB HONEY.

HOW TO GET THE BEES TO FILL THE OUTSIDE SECTIONS AS QUICKLY AND AS NICELY AS THOSE IN THE CENTER OF THE SUPER; A VALUABLE ARTICLE.

By S. T. Pettit.

Doubtless all close-observing comb-honey producers have noticed that the bees generally commence work at or near the center of the super, and that the work extends outward, the front generally being reached and finished first. From this we can readily understand that, while the center and front sections are ready to receive another super under them, they must wait until more work is done upon the side and back sections.

Now, as the bees come in they generally go up somewhere near the center; and as they find the sections advanced well nigh to completion, the honey must go beyond. Bees pass slowly and reluctantly over well-filled combs or capped honey in search of store room. It is obvious that this causes delay and loss of time, and is a strain upon their energy and industry. In course of time another super is given, and a similar process, though in a less marked degree, is repeated.

If by some simple means not distasteful to the bees we can cause them, as they come in from the fields, to separate and distribute themselves to the sides and back end of the super, work at these points will generally commence and keep pace with the work at the center.

Right here I may be allowed to say that my new system accomplishes this desirable feature most admirably, and I will now proceed to give it.

I get out two wedge-shaped pieces of pine or basswood for each hive I expect to use during the season. These are one inch square at one end and one inch wide at the other end, which is brought down to a feather edge, and of the same length as that of the hive. Now, when the bees begin to suffer with heat and for want of more air, with a suitable lever, after giving the bees a whiff or two of smoke, I pry up the front of the hive and slip under each side of it one of these wedges; this gives an entrance  $1\frac{1}{2}$  inches by the width of the hive. This large entrance and elevated hive, by supplying lots of air and ample roominess, comforts the bees and retards swarming.

But the *particular point* to which I desire to draw attention, consists in the trick played upon the bees, which causes them to distribute

themselves to the sides and back end of the super. For a short time after raising the front end of the hive, the bees, as they come from the fields, will seem a little confused when they find the bottom-bars out of reach; but they will soon find a new way up, some going to the right and some to the left, going up the sides of the hive instead of the middle, as formerly. The wedges close the openings and form continuous passages up, and some will march right along toward the back end until they can reach the bottom-bars. This places the bees with their loads just where wanted. Now see—this is all quite simple, and not at all objectionable to the bees.

Permit me to say I have carefully watched the process of comb building and filling under this system; and in some cases, though they are the exceptions, I have found the outside sections rather ahead of those near or at the center—one very important point gained.

But there is yet another new and valuable feature to be described. First, however, allow me to say that we have often, to our sorrow, found that the outsides of the outside sections, though fairly well filled, are, at least a good many of them, but poorly capped. This has often been a sore trial—so many poorly finished sections after looking so repeatedly and waiting so long.

It always seemed to me that, if more room could be furnished, more bees could be present, and thus a more uniform and the necessary heat kept up day and night at the outside of the outside sections; then the bees would feel and act like those farther inside, and would go on and finish up the job "in a workmanlike manner." But the difficulty would always come up that, if more space was given, it would only be filled with honey in poor shape.

At length I conceived the idea of giving two bee-spaces by putting in a divider to divide the extra space into two bee-spaces. Following up the idea I set myself at experimenting to test what seemed to me so full of promise. After experimenting with a good many different devices with more or less success, I tried the one which is here described, and it has given very good satisfaction indeed.

It is simply as follows: A piece of basswood or pine, about a sixth of an inch thick, and just the width and length of a separator, is bored as full of  $\frac{1}{8}$ -inch holes as the wood will stand and not split to pieces, and five  $\frac{1}{4}$  inch strips are nailed across it. These are turned outside against the wall of the super, thus forming two bee-spaces instead of one. The bees cluster on both sides of the divider, and pass freely both ways through the holes, and the work goes right along in good shape.

I tried a few with  $\frac{3}{8}$ -inch holes, with satisfactory results.

Notes.—Nothing is gained by giving more than two bee-spaces.

Dividers made of slats  $\frac{1}{2}$  inch apart leave the sections ridgy, reminding one of a miniature washboard, and, besides that, some brace-combs appear between the sections and divider.

I coined the word "divider," or, rather, applied it to the new device. I hope it will do. This system is applicable to all kinds of hives, and the cost is a mere trifle only. I have no supplies for sale, nor have I any interest in that line of business. Free to all.

Belmont, Ont., Dec. 26.

[Mr. Francis Danzenbaker has for several years advocated the use of deep entrances in the production of comb honey, and accordingly on all his hives he has what he calls his reversible bottom-board, one side of which has raised a rim making a  $\frac{3}{8}$ -inch space, and on the other side a deep rim, making a 1-inch space. In hiving swarms, or in the production of comb honey, he uses this deep space; but his argument has been that it forces the bees to get their honey away from their entrances, where it is cold, up into the top of the hive or super, where it is warm. I believe he never claimed for it, however, that it resulted in the equal distribution of comb-building and comb-filling.

As I understand it, your long wedges accomplish practically the same results as Mr. Danzenbaker's reversible bottom-board, only that he has a space of equal depth under the frames from front to rear. I hope others will report upon this during the coming season, and give us the result of their findings.—Ed.]

#### WINTERING BEES IN A BEE-HOUSE.

*Question.*—Would bees winter safely in a house built for them, where the temperature might be nearly as low inside the house as outside, providing it were so constructed that each colony would be inclosed in chaff packing, the same as in a chaff hive, with arrangements to close the outside entrances on the approach of cold weather, and give them ventilation from the inside, where the wind can not blow in upon the bees?

*Answer.*—It would be hard to tell for a certainty about this matter, without having tried it for a term of years. Bees often winter well with protection, and sometimes equally well without it. They are lost, too, under precisely the same circumstances. Low temperature is the demon which slays our bees more surely than any thing else in winter. If we had warm weather all the year round, here at the North, our wintering troubles would be at an end. Whether protecting each hive separately would overcome the trouble, which is almost sure to result where bees are kept in a continued low temperature, as they must be by such a plan as is proposed, is somewhat doubtful. Theoretically it looks all right; but so far as my knowledge goes, and from what I have gathered from others, such a mode of wintering has never been

made a success. I am of the opinion that the bees would winter much more successfully if left out where the snow could come up about the hives so as to partially cover them, and where the sun could shine on them whenever it is not obscured by clouds. My advice would be, not to put bees inside a cold repository; but if you do, keep its temperature up to from 42 to 48°, or leave them out to get the advantage of outdoor wintering. As a general thing it is best to adopt the method that has most generally proven safe with the main part of our bees, and stick to it. If we are not fully satisfied with this, then set apart a certain portion of the apiary for experimental purposes, till by experiments we have proven what is best for us in our locality, when we can then serve the whole apiary according to the successful plan, without danger of losing all our bees on some untried venture.

#### HOLES THROUGH COMBS.

*Question.*—Do bees ever freeze? I find little clusters of bees away from the main cluster, in my hives, dead, and a neighbor tells me that they were frozen to death. He also says that, if I will make holes through the center of the combs in the fall, it will obviate this trouble. Is he right?

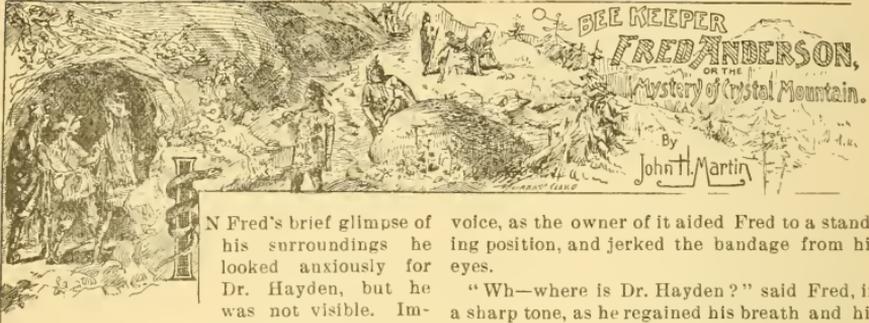

*Answer.*—In reply to this let me give a little of my experience and observation during the past quarter of a century. As fall approaches, if we minutely examine a colony of bees we shall find that the activity manifested during the spring and summer, in the interior of the hive, becomes less and less, so that, by the middle of October, in this latitude, all brood-rearing has ceased, and the bees have become partially dormant; still, so far they have not packed themselves away in a snug cluster, or compact shape, for winter. Every opportunity given by a warm day is improved to void the faeces, so the bees may be prepared for a long cold spell when such occurs. As the weather grows colder, the bees contract their cluster, many packing themselves away in the cells till the smallest possible space is occupied by them, and thus the requisite warmth is secured to keep them alive when the mercury sinks below zero. In this contraction of bees (at certain times) many of them are left singly, or in little clusters of from five to fifty, which do not recede with the main cluster, and thus are chilled where they are; and if the weather becomes cold enough they may be frozen, thus losing to the cluster that number of bees.

The reason formerly given for this was that, owing to the movable frames, no cross-sticks were used, as was the case with box hives, and hence the bees left no holes in the center of the combs as they did around the cross-sticks, thus compelling the bees to pass over and around combs of cold honey to keep pace with the receding cluster, instead of passing through the

center of the combs to the next range, which was more nearly filled with bees. In thus passing around, many became stiffened and were caught by the cold, which might have been saved if the holes had been provided in the center of the combs for them to pass through. To this end the Langstroth frame and others were provided with a shaving, bent to form a circle an inch in diameter, which was suspended from the top-bar by means of a little strip of tin, supposing that this would effectually secure a passageway for the bees. However, but a short time elapsed before it became apparent that, during a good yield of honey, this shaving would be filled with comb and honey, and hence the passageway was cut off.

Next, the practice of cutting holes through the combs, each fall, by various means, was resorted to, only to be filled up the following summer, when, as winter approached, the process had to be repeated. After trying all of these plans it became apparent to me that the reason assigned as the cause of the death of the bees was not the real trouble, for bees would stay and die within half an inch of these holes, when it would appear they could have passed through these passages just as well as not. I also discovered that, when the weather was cloudy, cool, and rainy for several weeks before it became severely cold, this loss was apparently much greater than when a clear warm day occurred immediately before a severe cold spell. By the number of bees that were found on boards and such places, dull and stupid after such a fine day, I concluded that these were the same bees that would have died by not following the cluster, had not a warm day occurred for them to leave the hive to die; hence, I say that the loss was apparently greater when no such day occurred, for many more bees were seen outside the cluster dead, as they had no chance to go out of the hive to die. From years of experience in this matter, I see no reason for changing the conclusion thus formed.

After the bees once get thoroughly clustered, I do not see this loss occurring to any such extent after a warm spell, and but little after a mild fall as the past has been. After being fully settled for winter, and this loss of old bees has passed away, a colony will lose but few bees for six weeks or two months, and will remain quiet. If at this time a warm day occurs so they can fly freely they again cluster back quietly and remain so about the same length of time, when they again desire to fly; and if such a chance occurs all will go well, and the bees will winter well. Thus we have a colony in a normal condition, and all the cold ever obtained in any portion of the world where bees can be kept with profit (occurring during this period between their flights) will not freeze or materially injure them if they have plenty of good stores within easy access.

N Fred's brief glimpse of his surroundings he looked anxiously for Dr. Hayden, but he was not visible. Immediately upon being blindfolded he was taken between two stalwart Indians and started toward the fire. Fred began to have some doubts about the doctor's sincerity, and for a moment thought he was to be burned and tortured in true Indian style. He remembered, however, that he had told the doctor that he felt equal to any emergency, and remembered the doctor's cordial indorsement of it, and he took courage. Instead of being led into the flames he was led past them, and soon knew from the confined air and echoing sounds that they were in a cave or subterranean passage.

The Indians commenced a low chant, and at the same moment Fred caught a low murmur, evidently from a distance. At first it sounded like the rustling of dead leaves in the wind. As they marched it grew louder until it sounded now overhead, now at one side, and then the other side; and Fred, forgetting himself, shouted, "That's a swarm of bees," and assayed to pull the bandage from his eyes; but strong hands held him. His senses were all alert now, and, feeling that no injury had come to him thus far, he quietly submitted to the ceremony, and thought that, if he was in a place where bees swarmed in the night, he could indeed endure any thing to be introduced into such a place.

The march continued, and soon the swarming sounds were left behind, and became fainter, and finally died out altogether. While his thoughts were dwelling upon the reality of the swarming sound he sensed the approach to open air again; but before he could fairly realize that fact, he was suddenly backed against an obstruction that sent his feet into the air, and an instant after it seemed that he was falling head first into space. But, no! there was something under him. He was sliding swiftly down a smooth trough-like surface; and before he could realize much, his position had changed; his head was up now; next he was standing on his feet.

"Hah, hah! by golly I bet you's scart. I bet you nebber rode dat way befo', and nebber want to ride dat way agin. Ain't dat so?" said a

voice, as the owner of it aided Fred to a standing position, and jerked the bandage from his eyes.

"Wh—where is Dr. Hayden?" said Fred, in a sharp tone, as he regained his breath and his senses, and saw before him a happy negro.

"Dr. Hayden? Dr. Hayden? don't know de man: 'spect you must hab taken de wrong road—ha, ha, ha! But I 'spect you want to see medical man Neo-a-ho-a—medical man am all right; want to see de gemman?"

"Yes, I do," exclaimed Fred. "I shall call him to account for my treatment for the past few hours."

"Ha, ha, ha! well, now, dat's a good joke—call de medical man to 'count! Ha, ha! call him to 'count when he's all 'count and you's no 'count; but, see here, my honey; befo' we argify any further we want to start dis business right. 'Low me to introduce myself. My name is Samuel Johnsing. I'm called Sam for short."

Fred looked at the negro before him, and saw a young fellow who was thoroughly permeated with happiness. It shone out of every feature.

"Well, you are a happy fellow," was Fred's involuntary exclamation.

"For gracious, of course I is; what ye spouse I's here for, any way? and, Mr.—Mr.—my name is Samuel Johnsing, Sam for short."

"Excuse me, Mr. Johnson; my name is Fred Anderson;" and they shook hands.

"Fred for short, I 'spect," said Sam.

"You have it," replied Fred; "but I want to see the doctor."

"Now, Mr. Fred," said Sam, familiarly, "de medical man am in his cabin, and don't 'low to be disturbed till mornin'. I 'spect you's tired too. I know from 'sperience dis inishatin' into de happy valley am very 'zaustin'. Oh! no, no; you don't need de medical man. You need rest. Come dis way an' I'll show you de camp dat'll be your home;" and Sam led the way, humming a lively air.

"I declare, Sam, you are happy, and I begin to feel happy myself. Does this valley make everybody so happy?" said Fred.

"I d'know how it'll 'gree with you; but I's always happy; 'spect I's built dat way. Don't cost no mo' to be happy dan to be sad; no mo' to be sweet dan to be sour; and don't cost so much to smile as to cry. De good book say, 'joy cometh in de mornin', an' I's one ob dat

kind what wants to make it mornin' all de time."

"That is a good way to live, Sam; and if everybody would only strive to live that way, what a sweet happy world this would be!"

"Dat am 'zactly so; but he'h we are, Mister Fred; he'as de cottage."

"Cottage! why, Sam, that s nothing but a clump of bushes."

"Wy, jes see he'h, Mr. Fred; it's a little dark yet, an' you don't seem to 'preciate de situa-shun. Step right aroun' he'h to de do'. Now take off de hat an' walk in. Dar, now, who wants any thing better'n dat?"

"Well, this is a novel affair," said Fred, as he examined his cabin. It was a natural growth. A circle about fifteen feet in diameter had been planted to cypress-trees, the tops all inclined inward. When the trees had all grown to the height of fifteen feet the tops and sides became solidly interwoven; then the clipping shears had been used to give the exterior and interior a hedge finish, and to cut an opening for a door.

"Plenty of fresh air in this thing," said Fred, as he saw the glimmer of the moon through the foliage.

"Fo' gracious, dat ain't fresh air, dat's climate—pure California climate; you'll jes feel like a cherub he'h."

"And here is my cot and other traps," said Fred, "and I'd like to know how they got in here so quickly."

"Oh! I 'spect de boys sent 'em down de elevator."

"There's an elevator, then. Well, now, why wasn't I sent down the elevator?"

"Ha, ha! dat wouldn't a been inshatin'. You'd a' forgot all about comin' in; but now your comin' in is pressed upon your mind delibly, and now you'll be comin' in dat way of your own 'cord."

"Not if I know myself," said Fred. "Do you think I want to try falling in here head first again? Not I."

"Wy! we do it jes dat way w'en we're in a hurry to get down."

"But why don't you slide in feet first instead of head first?"

"Wy, dat's 'cause you don't understand de chute. Yer 'sperience with it shows you dat it curves up at de bottom. 'Spose now you start in feet fust, you'd be standin' on yer head at de bottom. Dat would be 'stremely uncomf' table. Don't you see de utmost importance ob startin' in right at de top so's to come out on yer feet at de bottom? Oh! you'll get used to it, an' like de 'zideratin' fun. But he'hs yer cot an' things; jes make y'rself at home. Good-night."

"But, wait, Sam, I want to ask' you just one question. What was that noise I heard when coming in here, that sounded like a swarm of bees?"

"Oh! dat swarmin' noise? Wy, Mister Fred,

dat's one ob de mysteries ob dis occasion. Don't ax too many questions;" and happy Sam left Fred to himself.

When Fred found himself alone, and all excitement withdrawn, he would have fallen upon his cot with exhaustion had he not immediately done so voluntarily. Tired body and mind must be restored, and he fell into a sound slumber from which he did not arouse until a late hour in the forenoon. When he awoke he found Dr. Hayden sitting in a camp-chair just outside of his bowery-house. At first he felt strong resentment toward the doctor; then remembering that it was his own voluntary action that had placed him in his late positions he felt that he was under an inevitable fate; and he exclaimed, as he arose:

"Charity suffereth long, and is kind; beareth

"HAH, HAH! I BET YOU NEBBER RODE DAT WAY BEFO'!"

all things, believeth all things, hopeth all things, endureth all things."

The doctor looked up from the book he was reading, and, with a pleased expression, said:

"That is good doctrine, Fred. If in all the trials and troubles of life people would look upon them with Paul's philosophy there would be more happiness and a better understanding of the ends and aims of our existence. But now, Fred, as your culinary arrangements are not all in shape, come to my cabin and have a lunch, and I will then show you through our happy valley."

"Yes," said Fred. "I have had some experience with one of its happy occupants."

"Sam is a happy fellow," replied the doctor. "I picked him up in a most unhappy condition in San Francisco, three years ago; but he has developed wonderfully since he came here. He

is as faithful in his work, and as unflinching, as the rays of the sun."

As Fred walked down the successive terraces with the doctor, his eyes took in all they could of the surroundings. The forenoon sun lighted up the obsidian cliffs, sending down scintillating reflections of various prismatic hues. Successive terraces arose against the northern wall of the valley, while upon the south side there was a cliff a hundred feet in height. An occasional live-oak of natural growth and massive proportions lent picturesqueness to the view, and the later-planted eucalyptus, fruit-trees, and vines, were placed with a view to artistic effect. Every unsightly object, and even some of the highest-pointed cliffs, were covered with various flowering vines. Fred

three sat down together to partake of it, Fred said, "Doctor, this beautiful valley has excited my Yankee curiosity, and I hope you will excuse me if I ask what may seem impertinent questions."

"There is nothing to hide from you, Fred, now that you are inside the valley."

"Well, then, doctor, do I understand that you are the only white man living in this valley?"

"The only one excepting yourself, Fred."

"An' Sam Johnsing," said the latter, with an appropriate grin.

"That's so, Sam. We three," said the doctor, emphasizing the words, "are the only persons, except Indians, that live here or even have knowledge of this valley."

THE WONDERFUL VALLEY, CRYSTAL MOUNTAIN.

was a great lover of the beautiful in nature, and he exclaimed, "Doctor, you have made this a veritable fairy-land."

"I have tried to make it such, and I feel that it is a beautiful valley; and when you consider that those trees and vines, foreign to the valley, have been planted only eight years, you must know that this is the most fertile corner in all California. But here we are at my cabin, and your lunch will soon be ready."

□ Fred found the doctor's cabin about as primitive as his own; and smiling Samuel Johnson, Sam for short, was the presiding genius and cook. A simple breakfast of oatmeal mush, honey, milk, and fruit, was served. As the

"That is a mystery," said Fred. "I should expect to see some enterprising prospector looking down from the cliffs here at almost any time."

The doctor and Sam both smiled, and the former said, "Well, seeing is the most convincing argument, and by and by we will show you why it is that people do not look over the cliff."

"But," said Fred, wonderingly, "I know there is a passage into this valley, even if I did come through it blindfolded; and even a narrow passage would never have escaped the prying eyes of the gold-hunters unless there is a perpetual guard over it."

"That is it exactly," said the doctor. "There

is a perpetual guard in the shape of a huge stone in front of the entrance. It is so nicely balanced that two persons, knowing the secret, can open and close the entrance with ease."

"Well, well! This is a mystery, sure. But, doctor," continued Fred, with a quizzical expression around the eyes, "I heard something that sounded like a swarm of bees when coming through that passage."

"Oh, yes!" said the doctor, musingly. "I can readily see how a bee-man might mistake the peculiar noise. You were then in the rattlesnake chamber. No man can pass through that chamber and live unless guided by our Indian friends."

"Rattlesnakes, do you mean to say?" said Fred, rising abruptly. "Why, there must have been thousands of them."

"There, there, Fred; there is no occasion to be excited now. You are perfectly safe here. But let us change the subject. You have doubtless heard of several paradises for bee-keepers. Let me now show you mine."

DR. MILLER writes that he tried the honey-jumble recipe (see page 23) without using any molasses, but he says it did not work as well.

At last we have a bee-keeper and honey-buyer who is prepared to make analyses of doubtful samples of honey. I refer to W. A. Selser, 10 Vine St., Philadelphia. See his ad., p. 40.

HOME again. I am glad to tell you all that I am now once more at my post, ready to serve you as best I can, with renewed strength and energy. I reached home just as the last form was ready for the press. A. I. R.

I now have in hand copy for the new honey-leaflet, by Dr. C. C. Miller. I knew that the doctor could do the work well, but he has considerably exceeded my expectations.

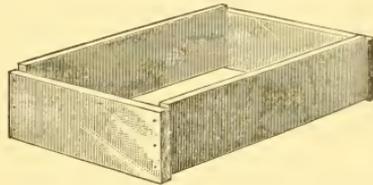

We shall have these leaflets ready shortly after the next issue, and will put them at such a price as will enable bee-keepers to give them away to their customers.

It would be a capital idea for bee-keepers to furnish their grocers these leaflets to hand out to all their customers. If they do not make a demand for honey, I do not know what will. Price and further particulars will be announced later.

Later.—Just as we go to press a package, of honey-caramels from Dr. Miller has come to hand. They are as fine as any I ever tasted; and by the way some of the rest in the office are "working their jaws" you would think they were of the same opinion. They are made of

honey, and have the distinct flavor of honey. The receipt is one of the doctor's own getting up, and will be given in the honey-leaflet above referred to

A SUBSCRIBER wishes to know whether planer shavings are as good as chaff. We are using the former right along now, and we do not see but they winter the bees just as well as chaff. The shavings have the advantage that they dry out quicker; and if enough are used they are just as good for warmth. This same subscriber also asks what kind of hive-stand we use. All our hives, both summer and winter, are set upon stands like that shown in the accompanying engraving. It raises the hive just

high enough to make it convenient for working, keeps the hives out of the wet, and the bottom-boards from rotting. These stands are made of the cheapest cull lumber, and at the present rate they will last ten or fifteen years.

#### "FISHING FOR SUCKERS."

THE following burlesque appears in an advertisement of one of the prominent commission houses of Cleveland. As it illustrates so nicely the growth of some of these mushroom "snide" commission houses, I reproduce it right here:

*Mr. John Dumbouer, Dear Sir:*—In reply to your letter, would advise you to go into the commission business. There is no other business in which fishing for suckers is so remunerative. There are a great many of them, and, as has been said, "a sucker is born every day."

One hundred dollars and plenty of confidence in yourself will start you nicely. You could rent a store and buy office fixtures on the installment plan. Then the first thing to do is to send out from 500 to 1000 circulars. On your card and circulars say that you "handle all kinds of produce on commission; special attention paid to the sale of butter, eggs, and poultry. Liberal advances made on consignments." (This latter in large letters.)

By sending out lots of circulars with big quotations you will get shipments at once. You will have plenty of customers as soon as you have goods to sell. Many of the grocers, market men, and hucksters like new openings. They will at once patronize you, pay outside prices, and cash. They will work you for credit later. When goods are all sold, send shipper a postal card, saying: "Goods sold at —; market active; ship more."

One commission house in Chicago started out on almost exactly the policy outlined; but instead of paying cash, and getting in a financial muddle, their chief man "skipped the country" with the hard-earned funds of bee-keepers. There are numerous other commission houses that are organized and operating upon almost exactly these lines. Their final collapse is only a question of a short time; but in the meantime bee-keepers need to look sharp, to be sure they are not one of the victims.

## DOOLITTLE IN FAVOR OF TALL SECTIONS, AND WHY.

DOOLITTLE, in his article in last issue, gives pretty strong testimony in favor of tall sections. You will note that he says that his own preference is for such, and that his reasons for preferring them are that "more in number can be set over a given space;" are "of symmetrical proportions," "pleasing to the eye, and do not give a scrimped appearance or pattern," and that "they bring two or three cents more per pound in the market." Mr. Doolittle was speaking in favor of sections  $3\frac{1}{2}$  x  $5\frac{1}{2}$  x 1 $\frac{1}{2}$ . This is so near the 4 x 5 7-to-foot that is more commonly used that I have no doubt his argument would apply with equal force to them. We as manufacturers dislike very much to help push along an odd-sized section; but if a certain shape brings more money to the producer, GLEANINGS can not and must not keep its mouth shut. Our journal is first and foremost the advocate of the honey-producer, and, secondarily, of the supply-dealer.

All through York State the tall section has been used to a more or less extent; and just at this time, when bee-keepers are preparing to order their stock, they would like to hear of all the good and bad things about the tall sections. Mr. Doolittle has spoken a word for them, and Mr. Sallsbury, of the same State, has given a note of warning. Let's hear from more.

## DARK CLOUDS AND THE SILVER LINING-AT THE REVIEW OFFICE.

BRO. HUTCHINSON, of the *Review*, has been passing through deep waters. First it was the long and serious illness of his daughter Ivy, resulting in the breaking-down of her nervous system, and now she has been obliged to leave home for special treatment for mental disorder. Mrs. H., on account of the long strain and weary hours of watching, is completely broken down in health, and now she has had to go away for treatment. Our friend not only misses the wise counsels and assistance of his helpmeet, but he has to labor alone under the strain that his loved ones are a way and sick—being cared for, it is true, by trained experts, but away from him.

I am sure the readers of GLEANINGS, especially those who take the *Review*, will sympathize most sincerely with Editor Hutchinson; but in spite of all the trouble and disadvantages under which he is working, it is a pleasure to note that he seems to see a silver lining to it all, and this is what he says, after asking his readers to extend a little leniency:

I am doing the best that I can under the circumstances, and feel sure that these troubles can not always last; that I shall yet be able, as of old, to make the *Review* one of the best journals that there is for the practical honey-producer. It is my life-work, and I love it.

It is true the *Review* has been a little late; but its standard of excellence has been remarkably well kept under up under the circumstances.

It is the prayer of the editors of GLEANINGS that all things may come out well in the end.

## THE BICYCLE IN THE REVIEW FAMILY.

BRO. HUTCHINSON is now in possession of a steed—not a real live one, but a real high-grade one. He says he felt many times as if he wanted a bicycle, but—well, he could not afford it. When his wife was sick he took long walks with her for her benefit. Then the thought occurred to him, "Why not a wheel?" He secured one, and he and Mrs. H. and the girls learned to ride it, although they met some difficulties at the start. When he bought a typewriter he wondered if he could afford it. After using it a while he did not see how he could afford *not* to have it. The same was true with the bicycle. He says:

And then if the brain lags, and the work moves slowly, take a spin of twenty minutes over the smooth walks of the outskirts of the city, and come back with the pulses bounding and the "blues" left scattered by the wayside. My brother editor, Ernest Koot, will know exactly how I feel, and so, I hope, do many others of my readers. I am really hopeful that, by another summer, wife and I may be chasing each other over hill and dale—on wheels.

Yes, indeed, friend H., I know what it is to come back with the "pulses bounding," with a feeling of invigoration and a clear head for work. "Blues"—well, I do not know that I ever had them—but I have had something worse. Thanks to the beef diet and wheel-riding, I have a clear head, clear countenance, good health, and weigh the most I ever did in my life.

Mr. Hutchinson adds another paragraph, which is right along in line with what I have been preaching, off and on, for some years. I wonder that more bee-keepers do not avail themselves of the use of the bicycle for out-apidary use. Even if they have a horse, there are many times when they could make a trip so much quicker on the steed of steel—one that never requires feeding, never gets to balking, and is *always* ready. Mr. Hutchinson says:

If I were running out-apidaries, I think that I should see to it that everything needed to work with was taken to each apiary, and then I should use a wheel as a means of conveying myself from one yard to another.

## THE UNITED STATES BEE-KEEPERS' UNION.

MR. HUTCHINSON has not said very much on this subject in his own journal; but in the December number he has an editorial which I copy entire.

I fear that the great majority of bee-keepers do not really understand what was done at the last meeting of the North American Bee-keepers' Association. It changed its name to the one that stands at the head of this article, and adopted a new constitution that will enable it to take on new and important functions. This constitution has been published in most of the bee-journals. It has not appeared in the *Review*, but I think now that it *ought* to have been published there; however, I presume that most of my readers have seen it. If they have not, GLEANINGS or *American Bee Journal* will gladly mail any one a copy containing it. In January the members of the National Bee-keepers' Union will vote whether they and their money shall be merged into this new United States Union. If this is *not* done, if amalgamation does *not* take place, then

the new, or United States Union, will go on, regardless of the old Union, and do the work that is necessary to do—the prosecution of honey-adulterators for one thing, and the old National Union can sit still and do nothing except to guard and brag of the \$700 that it has amassed since it stopped doing any thing. I don't wish to be disrespectful; but, honestly, the work for which the National Union was called into existence has been finished—*practically* finished—and other work of a hundred-fold more importance is looming up and growing greater and greater as the months and years go by. A good lot of money in the treasury is a good thing; but *good* accomplished with this is better than the money itself. In the "Extracted Department" of this issue of the *Review* you will find that I have written more fully upon this subject. I hope that every member of the old National Union will consider well before he votes. We need just one good, strong, wide-awake, enthusiastic national association of bee-keepers, and that is enough. Only get the thing started right and there is no question but that it will "go." Already money is being sent to the Secretary of the new United States Union, Dr. A. B. Mason, Sta. B, Toledo, Ohio, to join the Union "that is going to prosecute dishonest commission men." Just as soon as it is really evident that we are going to have a Union that will do *something*, there will be no lack of members. Let us have amalgamation, then will follow plenty of members, and there will be plenty of money; and then, with the right men at the helm—men with "go," determination, and enthusiasm—much good will come to bee-keepers as the result. The times are ripe for this move—let us move.

I indorse most heartily the sentiment of this. It is indeed true that the work which the National Union was called into existence to perform is practically finished, yet there is other work a hundred-fold more important. A lot of money in the treasury is a good thing; but a lot wisely expended, and an empty treasury, in prosecution of dishonest commission men and honey-adulterators, would be a far better condition. Mr. Hutchinson is right.

#### IMPROVEMENTS ON HIVES; IS THE DOVETAILED HIVE PERFECT? THE HIVE "MONOPOLY."

In the *American Bee Journal*, p. 834, a writer under the *nom de plume* of "Inventor," at the beginning of an article uses these words: "In the bee-papers I find the idea prevalent that the present Langstroth hive is perfect, and that no one should undertake to improve hives further than to accept the Dovetailed hive as a standard. . . . An Inventor can be just as honest as Mr. Langstroth, and I do not believe the time has come when all should say, 'It is perfect—let the monopoly go on.'" And, again, he says, referring to improvements on hives, "I think that manufacturers make a mistake in crying down improvements that they may control the sale of certain fixtures."

From certain other references and allusions, outside of what is above given, it would look as if Inventor had our firm particularly in mind, although it is possible he meant all.

Starting with the first quotation, most emphatically I do *not* believe the "idea is prevalent" that the Langstroth hive is perfect, and that "no one should undertake to improve beehives further than to accept the Dovetailed." I am quite conversant with what appears in our own periodical, and I believe I am tolerably

well acquainted with the matter in other bee-papers. As for ourselves, we have never believed the Langstroth nor the Dovetailed hive was perfect. We have been looking so much toward improvements that many of our friends have asked us to "let up," because their new fixtures did not fit the old. But it is nevertheless the fact, that, when one manufacturer makes an improvement that meets with popular favor, the others follow along in the same line, and very often—yes, *generally*—cut prices. What foundation is there, then, for the sentence, "It is perfect—let the monopoly go on?" The fact of the matter is, there are hardly any two of the manufacturers that sell exactly at the same prices on hives. A comparison of the various catalogs will bear out the statement.

We have for some time had a department in this journal, called Trade Notes, in which we have illustrated and described various hives of merit. For instance, I would call attention to the Danzenbaker hive, the Heddon, and the Aikin-McKnight hive, all of which possess peculiar and valuable features, none of which are based on Langstroth dimensions. Moreover, The A. I. Root Co. is about to give in its catalog the option of the Dovetailed or Danzenbaker hive. The latter is as much a departure from Langstroth principles as any thing can well be. There is nothing standard about it, and yet it is a hive that gives much promise, and one too that certainly does contain some desirable features.

Again, I would call attention to the fact that GLEANINGS has pushed forward the merits of the tall section, and that right in the face of the fact that the 4½ square ones have been used almost exclusively. If we as manufacturers were "crying down improvements," it is hardly likely that we would push forward an odd-sized section and an odd-sized frame.

From my point of view, Inventor's observations seem to be all wrong. If he had said the very opposite of what is set forth in the quotations above given, he would, in my humble judgment, have come nearer the truth. I venture to state that, if he would go through some of the large supply-manufacturing establishments of the country, he would have reason to change his mind. We have in our establishment an experimental room, and an "inventor" who is at work all the time. In the near future I hope I shall have the pleasure of showing that *our* "inventor" has not been idle by any means. The new thing will not be an improvement, but an *innovation*—something that, in my humble opinion, will be classed alongside of the extractor, comb foundation, movable frames, and the bee-smoker. The world does move, even in the apicultural line, friend Inventor; and if you will call upon us some time I'll try to convince you that there is progress, even at The A. I. Root Co.'s works.

I SEE by the *American Bee Journal* that the secretary of the U. S. B. K. U., Mr. O. L. Hersheiser, says he will try in every way to make the meeting at Buffalo a grand success. Mr. H. is a hustler, and a man who is not afraid to work. It goes almost without saying, that the Buffalo meeting is going to be a good one.

THE editor of the *American Bee Journal* has a happy way of getting off puns. Here is a sample:

Mr. R. C. Aikin, who contributes a valuable article to this number of the *Bee Journal*, is now writing a series of articles for GLEANINGS under the heading of "Ridgepole Musings." The rather topknotty first half of the name was suggested, we believe, from the fact that for several years Mr. Aikin kept bees in Colorado, several thousand feet above sea-level—on the very "Ridgepole" of the continent; and he is now in Iowa, where he is indulging in the "Musings" part of the heading. Judging from the first installment, the "Pollings" of this new "Ridge Muse" will cause an "Aikin" (achin' for more of the same kind, on the part of those who "R. C.-ing" what he has to say.

TWELFTH ANNUAL REPORT OF THE NATIONAL BEE-KEEPERS' UNION; MR. NEWMAN'S CRITICISMS; AMALGAMATION FOR THE FUTURE.

THE above report, for 1896, is at hand. The Manager states that the past year has been one of the busiest since the Union was formed. After re-counting the usual defense cases, Mr. Newman has at last, it seems, done something in the way of taking up the difficulties between bee-keepers and commission houses. These last issues are rather an innovation in the Union. Although the constitution was modified several years ago, so that it could take in such cases, yet very little has been done along these lines till the year just closed; and then it would seem as if this tardy action were owing to the hints offered now and then during the year, and the criticisms of late to the effect that there are other issues tenfold more important. Some of the cases of the commission houses taken up have already appeared in the *American Bee Journal* and GLEANINGS; but beyond the mention of using the name of the Union, and publishing the facts, he seems to have done little more than the journals.

The subject of amalgamation is next taken up. The constitution of the U. S. B. K. U. adopted at Lincoln is given, and then the criticisms of the General Manager, as offered some little time ago, and published in the journals. Mr. Newman then pays his respects to the editors of the *American Bee Journal* and GLEANINGS, characterizing their criticisms of his policy as a "storm of abuse," "unpleasant personalities," and then adding that they threatened to defeat him at the election if he were a candidate for re-election as General Manager. Mr. Newman has misrepresented (I try to think unintentionally) by giving only partial quotations or telling only part of the truth and then putting his own construction on them. It was

GLEANINGS that stated it would work by all "fair and honorable means" to defeat him if he were a candidate, but added the proviso, which Mr. Newman omits, that if it was his policy "to prevent and possibly postpone amalgamation indefinitely" then it would work to defeat him, etc.

How Mr. Newman can construe what was said in GLEANINGS as a "storm of abuse" and "unpleasant personalities," I can not see. It is true, I criticised his policy of confining his attention to the defense issue mainly, but criticisms of policies are not necessarily "storms of abuse" or "personalities."

Mr. Newman has done what, I am sure, will be severely criticised—viz., setting forth only his side of this amalgamation matter. He has not only put in his own criticisms, but those of a few others, *without their names*, giving only one side. A General Manager, or any presiding officer, should act impartially by giving both sides fairly. Certainly the opposition should have a chance to state its own arguments in its own language. As it is, he has attributed to us motives we did not have, and sentiments that we never uttered, by putting his own construction on what we did say. The journals, on the other hand, have freely given all that he has sent in for publication in the way of a reply or defense. Doing as he has, giving only one side, and that his own, in the report at hand, I shall be very greatly surprised if the proposed scheme for amalgamation carries; and, moreover, one of the men whom he has recommended to count the votes, has, in the *Progressive Bee-keeper*, criticised most severely the *American Bee Journal*. Such a person can hardly be impartial. I have nothing against Mr. W. D. French. Outside of his very apparent prejudice he would be as good as any man to count the votes and certify the results to the General Manager; but it certainly would have looked very much better, in view of the position that Mr. French will occupy, if he had kept still.

If amalgamation should be defeated, as now seems altogether probable, GLEANINGS will submit. The U. S. B. K. U. will go on, however; and if amalgamation can not be effected this year, strong efforts will be made to have it done a year hence; for bee-keepers can not afford to support two societies; and if Mr. Newman shall continue to take up the question of dishonest practices on the part of commission houses and the question of adulteration, GLEANINGS will be quite willing—in fact, will be glad—to support and work for him as Manager of any Union that may be formed in the future. Mr. Newman has shown splendid ability in one direction—viz., defense; and now if he will only turn that ability in other directions, GLEANINGS will be very glad to see him stand as General Manager.

## IN THE DESERT.

Dec. 28.—Here I am, away out on the desert, camping out, and writing these notes beside the camp-fire. We are at New River, Maricopa Co., 45 miles from Phoenix. We left the last irrigating-canal at 11 o'clock; and a board put up warned travelers, "No more water for forty miles." I rode on my wheel 14 miles before 8 o'clock, so as to be on hand at the start. I got breakfast on the way; but before starting I had some more breakfast. Let me explain, I wanted to take the long trip on my wheel alone; but everybody protested, and said I must have a team to carry provisions, bedding, etc., as there was no lodging-place for many miles, and, furthermore, storms might overtake me, and I might get lost. Finally a couple of bee-men, whom I shall always remember, rigged up a team, with provisions, bedding, etc., and announced they were ready to follow wherever I wanted to go. Their names are Thomas K. Elvey and J. F. Carey, both of Phoenix (the latter gentleman being president of the Maricopa Bee-keepers' Association). Both are very busy men; but when they found I was bound to go they declared I should go in good shape, providing I could stand "roughing it." This is a sample of the hospitality of this region. I ride my wheel as long as I choose, then stick it on top of the bedding, etc., and ride on the light spring wagon and listen to the stories of my companions and explanations of the strange things we come across every hour.

Oh how I have enjoyed this trip through the arid desert and up the canyons, and over the mountains! I am now writing by a candle stuck in a bag of barley. My table is a roll of bedding, and my seat is the soft desert sand covered with a piece of canvas. The camp-fire is at my right hand. Our supper consisted of potatoes roasted in the ashes, toast made on a forked stick; meat; fig jam, made from fruit grown by Bro. Elvey, etc. Just think of it—sitting on the ground out of doors, writing by a candle, between Christmas and New-year's day!

This afternoon we passed a flock of 2400 sheep, managed by one man and a shepherd dog. I took off my cap to the man, and felt like doing the same to a dog that had the intelligence and skill to guide and direct this great drove in any direction desired.

We are near a running stream of water, after our long drive, and it was my privilege to build the fire and help gather wood for the night. I never felt so well in my life, and I have been out of doors almost constantly for the last three weeks. Now, while I have every thing so comfortable about me, and two old veterans in the business near me, I think I will tell you something about

## THE SALT RIVER VALLEY, AND IRRIGATION.

This valley is about 50 miles long by about 30 miles wide. The river runs through the valley, and, strange to tell, there are thousands of acres as flat and level as a floor, only that the surface is on a regular slant toward the south and west, at an average of about 10 feet to the mile. There are, perhaps, 250,000 acres capable of irrigation. All along the river are dams that take water into canals at intervals. These canals are at first considerable-sized rivers; but smaller ones lead off as needed, until all the water of the river is spread equally and equitably

over the land. Now, please bear in mind that the whole valley is divided by good roadways into square sections one mile on each side; and along each road, and on both sides of the road, is one or sometimes more irrigating ditches. I say one or more, for there are often three ditches, one on one side of the road. Sometimes the water is hustling in one ditch in a certain way, and in the *opposite direction* in the ditch right alongside. This is managed by raising the sides of the ditch at one end, and cutting down at the other. Now, remember the water in ditches side by side is often at different elevations. One ditch often crosses another as much as three feet above the lower one. A wooden box carries the water across. Of course, bridges or plank sluiceways must cover the ditches at all road-crossings. Go where you may, the sound of rushing water and babbling brooks is always in your ears. This sound, with the sight of the running waters, is to me most inspiring. But, wait a bit! All over this valley cottonwood-trees are growing along the ditches. In a little time they shade the road, and in the older settlements the branches meet overhead. Even in *winter* time the shade of these trees every afternoon is very grateful. The roots hold the banks of the canals from being washed out. The cottonwood holds its leaves all winter, and grows with wonderful rapidity. It is so hardy that green posts driven into the ground during the winter will grow almost certainly, with plenty of water. Now, all the fences are wire, and the wire is stapled to these cottonwood posts or trees\*.

The great staple crop of this valley is alfalfa. I have told you of the beauty of the fields. The greater part of the alfalfa is fed to cattle, and this is the place of all the world for patients on the beef diet. In Cleveland, O., I paid 50 cents for a plate of ground beef. At the "Grotto" restaurant, in Phoenix, for 10 cents I got more than I ever eat; or a nice tender steak, more than I could eat, for 10 cents, potatoes included; butter, milk, and cheese, about the same as in Ohio. Chickens, turkeys, geese, and hogs, and, in fact, all kinds of stock grow fat on green alfalfa. At the restaurant I got a nice dinner of turkey for 15 cents, potatoes included.

Large quantities of hay are made here and sold at \$4.00 or \$5.00 a ton. At the "corral" (livery stable) they will take your horse, and feed and care for him for 25 cents a day, and hitch up when you want him again. If you do not leave him a whole day, it is only 15 cents. Please remember, the horse needs *no grain* if he has enough alfalfa hay. Still further: If the man who owns the horse has his own blanket with him he can make his bed on some hay in a vacant stall, and *not a cent* for lodging.

One morning I was to meet some bee-friends at the corral at daylight, and I found quite a number of well-dressed men getting out of their blankets, and washing at the pump where they water the horses. Soap is furnished to all, and *no charge*. When I spoke of sleeping outdoors, one of the bee-friends showed me his bed under the shed adjoining his bee-house, where he sleeps right out in the open air *every day in the year*. Think of sleeping in a bedroom with *not a window open!* No wonder the people of this valley are *healthy*.

Brother Elvey tells me the coyotes will be howling around us before morning. Our candle is still burning right in the open air, but it is almost bedtime. We have just been listen-

\* Besides the music of the "babbling brooks" every morning, the air is vocal with the songs of the meadow-larks, blackbirds, and the cooing of the mourning-doves. By the way, there are three kinds of doves.

ing to a story of killing 55 ducks at one rising—at three shots. The next story, by friend Carey, was about killing three deer out of a bunch of four before they got away.

Good-night, dear readers of GLEANINGS.

Dec. 29.—Last night I went to sleep gazing at the brilliant starry vault above. I believe it is generally agreed that the heavens are more brilliant here in the South, especially on the prairies, than in the North. Well, just before midnight friend Carey announced that we were in for it—raindrops were falling. Our supper-table was left standing, so as to be handy for breakfast; but I tell you there was some hurried packing of the dishes, bedding, etc., into the wagon. Soon the stars were gone, and it was too dark to attempt to regain the road. Our fuel was about out, and no more to be had—no lantern—we might get into the river, overturn the wagon, or do worse. When things began to look desperate Bro. Elvey remembered, evidently, the old Bible story of the torches inside the pitchers—Gideon's army. He got the end of the candle left after I got through writing, lighted it, and held it inside the water-pail turned on its side so as to keep off the gusts of wind, and we regained the wagon-road, and in this manner reached a barn which *happened* to be near—the only one, in fact, in many miles; and, didn't we rejoice in the shelter!

#### THE BEE-KEEPERS OF SALT-RIVER VALLEY.

Between forty and fifty bee-keepers have produced, during the past season, 31 carloads of honey. Many of the apiaries have over 200 colonies in one location, and some have even 300; and even with this large number, as much as 175 or 200 lbs per colony, right through. The valley is said to be pretty well stocked at the present time, however. Even though the crops of honey are large, freight is so heavy that the net price realized by the bee-keepers is very low. Alfalfa honey sells, retail, at 5 cents; by the 60 lb. can, 4 cents, *can included*. In car lots, after taking out cost of cans only about 3 cents is realized. A nice article of well-ripened alfalfa honey is nearly if not quite equal to our best eastern white clover.

Dec. 29.—After the rain slackened up I asked what our bill was for the use of the barn, for our bedding and horses, and the reply was \$2.00. We had our own provisions, and furnished our own feed for the horses. I finally persuaded him to accept \$1.00. This place (Gibson's ranch) was the only one where we felt like complaining of the prices. To-day we saw great mountains, with snow-capped peaks, towering above the clouds. While some were illuminated with sunshine, many others were being deluged by thunder-storms, and twice we saw floods of muddy water rushing down across our path. My supper by the camp-fire was quail on toast. These desert quail, under Mr. Elvey's cooking, were delicious. He says he can dress eight quail in sixteen minutes.

Along at intervals we find water, and some of the watering-places are curious and interesting. At Squirrel-hole Springs the water bubbles up in little holes in the solid bed-rock of a dry river-bottom. The largest of these holes will admit a water-bucket.

In going up a long mountain road we saw ahead of us three teams with their huge loads, and four or six horses, stopped by a breakdown. Of course, all three stopped to help repair the wagon belonging to the unfortunate brother. Mr. Elvey soon found one of the crowd was a Mr. W. W. Burford, of Kansas City, a bee-keeper, and a subscriber to GLEANINGS. He walked back with us up the mountain, just to have a little talk. Friend B. has been almost a year exploring Arizona, and has among his col-

lection a real *mummy* that he found in one of the cliff dwellings.

After the severe rain of Monday night I found it impossible to run my wheel over a good deal of the road, on account of the sticky "doby" mud. It would cover the rubber tires like melted beeswax; and when it got on the steel chain there was no more wheeling, and it is a long job to clean it off, I tell you. The trouble is not confined to bicycles, for at some points this do-by mud collected on the wagon-wheels until they looked like huge barrels, and two stout horses could hardly pull a light spring wagon. When this load of mud dropped off the wheels of the wagon it was, of course, a big obstruction in the road for the next team that came along. The greater part of the roads, however, are very hard and firm, and there are only a few days all winter when there is mud anywhere. The last night of 1896 we passed at Hance's Ranch. As the family were away for the winter we found only the hired man and a teamster, who had a sick horse. Now, these teamsters, like many of the miners, seem to think the best credentials of good breeding is to bring in cursing and blasphemy about every other word, whether it makes sense or not. The sick horse was cursed, and the weather and every thing else. I tried various subjects of conversation, but the replies were all the same. I finally made up my mind that, even if we were in one sense forcing these people to give us a shelter from the snowstorm without, I should get these two men apart, and, one by one, labor with them in regard to such talk. After supper we sat around the fireplace and began to tell stories; and I prayed most earnestly for grace and wisdom to speak the right word at the right time. My prayer was answered in a very unexpected way. In fact, I almost held my breath in astonishment when story after story was told, without a slang word of any kind. These two men were so changed I could hardly believe my senses. Instead of complaining and sneering at every thing good and holy, they were pleasant, respectful, and gentlemanly. When Mr. Elvey and myself were getting under our blankets that night I said:

"Friend E., can you explain this sudden and wonderful change in these two men during the pleasant evening just past?"

"I suppose I can partly, Mr. Root. I saw how their talk pained you, and I suggested to Bro. Carey that he should talk with them, as he is used to such characters."

Let me explain here, if I haven't before, that my companions are both professing Christians. Mr. Carey is a Quaker, and in the true Quaker spirit he presented the matters so well that these two seemed "clothed and in their right mind," all the rest of the time we were there. New-year's morning the sky was bright and clear as I wished all a "happy new year." Then I added to the teamster:

"My dear friend, can we not, this morning at least, 'praise God, from whom all blessings flow'?"

"Yes, sir! that's my doctrine," he replied; and I inwardly prayed that it might be so, instead of *cursing* God at every breath.

Oh what a "happy New-year's day" I did have! As we reached the mountain pass and prepared to go down Copper Canyon we had a glimpse of the Verde Valley, three miles below, or at least we had a glimpse of the clouds away down below us. How strange it makes one feel to be with the sun far *above* the clouds! Then the canyon all the way down is full of beautiful shrubs and various kinds of evergreens; and pretty soon a spring commences to send down with us a clear and sparkling "babbling brook." This brook is green with most appetizing and

brilliant water-cress almost its length. The road takes first one side of the canyon and then the other; and the grade is so gentle that a wheelman would go up or down almost every part of the route. The Verde (green) Valley is somewhat like that of Salt River, but not as level, and only a little of it is under irrigation, although there is an abundance of water in the Verde River at all times of the year.

Let me explain here that I found we had a subscriber at Camp Verde. Here is what he answered when I wrote him:

*Dear Bro. Root:*—We shall be delighted to entertain you as long as you can stay with us, and may be able to go with you to some of the points of interest to you. We had thought of sending you a car, but supposed you would go to Flagstaff by rail, and so not come near enough to us. We are Ohio folks, and have lived in Medina. [C. B. BELL.]

Camp Verde, Ariz., Dec. 24.

What strange things do happen! After we were received and made welcome at friend B.'s pretty home I learned as follows:

Years ago a very pretty girl was threatened with consumption. I was then a patient of Dr. Salisbury, and finally induced the relatives to try the Salisbury treatment. Dr. S. said we had waited too long, he feared, but we would do our best to rescue her. For a time she seemed to be recovering; but she caught cold, and went down very suddenly, leaving two children. Mr. Bell, whom I found away out here in the wilderness, is the older one of these two children. Oh how it did rejoice my heart to find a Christian home away out here in the desert.

### CHILD-TRAINING.

CONCLUDED FROM LAST ISSUE.

*By Miss Sarah Smith.*

By way of contrast let me give you this little incident of another mother, told by her daughter after reaching womanhood. "One day," she says, "I stood watching my mother make strawberry preserves. Beside the stove stood a large milkpan containing squash for pies, with the milk and egg already added. 'Now, Bridget,' said my mother at last, in a satisfied tone, 'it is done; take the kettle off.' This was accomplished, and then, with almost incredible stupidity, the girl actually emptied the strawberries into the squash. My mother turned her head just too late. She was quick and impulsive, but there escaped her lips only a despairing 'O Bridget!' Then as she saw the girl's instantly regretful face, she uttered no angry reproaches, no useless lamentations. No doubt," says the daughter, "when my tired mother, who was not strong, went upstairs to rest, she felt disheartened, and thought that her time, labor, and material had all been wasted; but probably she never did for me a more valuable morning's work than when she gave me that unconscious lesson in sweet self-control."

In my work as a teacher I have come to the conclusion that little children learn most easily when not making a conscious effort to learn. The very effort to attend often takes the mind from the thing to be attended, and leaves it less free to grasp the new thought; hence it is that the unnoticed child, supposed to be wholly engaged with his play, is often absorbing every word you utter, and making conclusions that would astonish you could you look into that active little brain. Do you know that nearly all a child's judgments of persons and things are formed before he is eight years old, and formed for the most part by the conversations he has heard at home and the unconscious in-

fluence of those about him? In proof of this, witness the politics of the six-year old—same as his father's, of course. Yes, that daughter's hasty, unwise marriage, that so sadly grieved the loving father and mother, may be traced to influences set in motion before she was old enough to wear long dresses. The contemptuous tone in which she so often heard the unmarried women spoken of; the praise she heard bestowed upon the successful man, regardless of the rights of the case; the choice for her of accomplishments rather than culture; the early-fostered ambitions for style and show, all had something to do with it. You can not begin too soon to help a child form right estimates of character. I know a father who takes special pains to have his ten-year-old daughter meet men of real worth, and who seeks opportunities to commend in her presence the true and honorable, especially when found in the humble walks of life, or where not likely to be appreciated, and to show contempt for the base, unworthy, and pretentious, however well supported by name or position. The events of every town or neighborhood furnish many opportunities to speak your convictions, to utter a warning, or point a danger years before the child is old enough to be made uncomfortable by such remarks or allusions; all of which will help in forming her ideals of life and persons.

And, again, I repeat, high ideals save. Now, I suppose if I should ask for greater freedom for the children in your homes you would smile, thinking that far too many now do just as they please. I do not mean greater liberty or license, but greater freedom to grow naturally, greater freedom in the exercise of their own individual tastes and choices in non-essentials; freedom from the ever constant consciousness of your presence. I am quite sure that children are often harmed and burdened by our attention, begun as soon as born, when, instead of being allowed to remain quietly in a darkened room with only enough attention for their comfort, they are dragged out to be shown to every chance caller, and hugged and kissed and trotted and tossed till no wonder nervous days and sleepless nights follow.

So much is written nowadays about what parents should do for their children that I am afraid some are in danger of overdoing. While the very best training often consists in a judicious letting alone, I do not mean that children are to be left wholly to their own devices, to be allowed to get into mischief, quarrel among themselves, or run wild on the streets. While you are never to drop the reins of family government, you need not hold them in such a manner as to make the child constantly conscious that he is being restrained or driven.

Nervous and fussy mothers weary and irritate their children with their numerous cautions. The child ought not to have the feeling that he is being watched all the time. My sympathies are with the boy who sent the cat back into the house because, as he said, he could not have her hanging around all the time; it was bad enough to have God watching him all the time. "The eyes of the Lord are in every place, beholding the evil and the good," is a grand true thought, but not just the one with which to begin a child's religious instruction. Postpone that till you have taught him that they are *loving* eyes. Furnish the child right environment, and then—hands off!

I remember being at one time in a home where was a little child about two years old who had been kept in very closely all winter. When the bright spring days came she grew eager to get out of doors; but no sooner was this permitted than she started as fast as she

could go for an orchard and a ten-acre lot back of the house. When brought back she would cry, and thus spoil all the pleasure of the morning walk. It was finally agreed that she be allowed the desired freedom while we watched her unobserved. She started as usual for the orchard, trudging on as fast as she could go toward liberty and the vast unknown. Her happiness was complete till she happened to look back from just below a little hill and found herself out of sight of the house. Surprised, bewildered, and homesick, she gave a pitiful little cry of "Mamma!" and was very well content to be led back to the bondage that meant love and safety. It seems to me that there is a suggestion here for the treatment of older children. Let the boy or girl who has reached the restless period of life take short flights out into the unknown world, giving him a chance to test his own powers and exercise his own judgment; he will come back all right, with an added love and appreciation for home. I like the way Aunt Joe managed the fiery Dan in "Aunt Joe's Boys."

You remember, no doubt, how the immortal George Washington rode his father's colt to death, which was bad for the colt, but better for George than going to sea, as he at first proposed doing. I often wish that boys in their teens could be set to breaking colts. It would furnish the muscular activity and mental excitement so much needed at this period of life, and give an opportunity to work off surplus energy and pent-up steam. But if he can ride nothing else, do let him ride his hobby, if he has one.

I was reading the other day of a mother who said she did not worry about John or Henry, but she did feel uneasy about Willie, because he had no hobby. She said if either of the other boys had a leisure hour or holiday they always knew just what to do with it; but Willie was always at the mercy of whatever happened to come along. So, do not discourage hobbies, even if there is some little expense connected with them that to you seems foolish. Better spend on chemicals, postage-stamps, or tools, than upon cigarettes and trashy literature.

Seek to give the child a chance to do the right thing from choice; then if he fails, let him suffer the natural consequences and thus early learn the lesson of cause and effect. Let him see and feel in all this that he has your sympathy and love, but do not be weak enough to step in to shield him from the consequences of his own deliberate wrong-doing.

A little child in school one day was given with the others a piece of colored paper to fold and paste. Failing to follow the teacher's directions, his paper was torn and spoiled. He immediately informed the teacher that his paper was spoiled, expecting to receive more. He was met with no reprimand for his carelessness, but only "I am sorry you have spoiled the paper I gave you." How could he more easily or with less cost and pain learn this life-lesson of care in the right use of gifts and possessions?

And now before closing I want to say just a few words about the strong-willed child that is so often such a dread to parents and teachers because so hard to control. These are the children most likely to be misunderstood and wrongly dealt with—made of the finest material, requiring the greatest care and skill, but, like the hardest wood, difficult to manage, but strong, firm, and true, and most valuable. Really it is the amiable, docile child that should cause you the most anxiety, not the strong-willed child. The world needs people to-day and every day who are strong-willed enough to carry through discouraging reforms and all worthy undertakings. It is the rushing, plung-

ing stream that has force to carry the sediment and refuse to the sea, to turn the mill, and to flow steadily on through the drouth of summer and the chilling winds of winter. Never think for a moment of breaking such a child's will; seek only to guide and direct it. Avoid as much as possible the arousing of a child's self-will or obstinacy. Make only reasonable demands, and always in a pleasant, courteous manner. Avoid direct commands, as requests should carry the same force, and are less likely to antagonize. Then if a child disregards your request you can often leave him the choice between two alternatives; as, be quiet or leave the table. Say "please," or go without the desired object.

How much may be accomplished by tact is well illustrated by an incident given in *The New Crusade*, of a child visiting her aunt. On the first day after the little girl's arrival, as she was playing out of doors in the early evening her aunt tapped on the window-pane and said pleasantly, "It is bedtime now. I want you to come in." The little girl faced her, and said, "Do you think I've got to come in because you say so? Huh! I won't do it." Her aunt tranquilly resumed her work, taking no further notice of the child. Gracie evidently looked for a show of indignation when she came in between nine and ten; but no notice was taken of her, and she went to bed flushed with victory. But the next night, immediately after tea, her aunt took her up to bed, saying kindly that she would be glad to let her play for an hour first, but she could not trust her to come in when she called her. The little girl looked thoughtful; but as soon as her aunt left she dressed herself again, went down to the yard, and was soon sporting about as wildly as ever. No attention was paid to her when she came in; but the next evening after tea she was again taken up to bed, and the door was locked. "If you lock me in," she exclaimed, "I'll tear the sheets and pillow-cases all to strips."

"Oh! just as you like as to that; only, of course, you'll have the same things on your bed to-morrow night, as I can't afford to have more than one set spoiled."

"Well, I can't bear to be left alone," said Gracie, beginning to cry in earnest.

"I ought to have thought of that," said her aunt. "Of course, then, I'll stay with you."

Then she talked to the child. She told her what a grand thing it was to have such a will. It is like riding a spirited horse that is carrying you fast in the right direction, but that an uncontrollable will is of no more use than a runaway steed. Instead of giving her the "good scolding" which most mothers would say she richly deserved, this sensible woman told her stories of strong-willed girls who, in the face of terrible odds, had earned a living for poor and disease-stricken parents, or achieved an education for themselves, or started some reform for others which they had victoriously carried through. "That's the sort of girl you will be, Gracie," she exclaimed. "A little girl like you must amount to something, either good or bad; and I say it will be good."

"I say it will be good too," exclaimed the sturdy little soul, sitting up in bed, and casting her arms about her aunt's neck. "I will try, Auntie; you'll see."

Such incidents as this make one feel that there is no case so difficult that might not be reached if we were only wise and true enough to touch the right spring of action. To this end and for this purpose we need to study child nature in general and each child in particular for the laws that govern action, for there are laws. Child-training is not a hit-and-miss work. The laws of cause and effect hold good

here as everywhere else in the world. We may not be able always to trace results to causes; but the more we look for it, the oftener it will be found, and help explain conduct that seems so inexplicable.

We had a little boy in our schools at one time who was always good when clean and well dressed, but willful and troublesome when untidy or wearing old ragged clothes. I was much interested not long ago in the account of a little child who refused to have her picture taken. Coaxing, threats, and punishment were all of no avail for a long time. At length she promised she would comply with their wishes if they would wait until after her birthday party, one week hence. This was agreed to, though what that had to do with it could not be imagined until she was overheard bidding her dolls good-bye because she must have her picture taken and die, and go to heaven as her little cousin did. She did not want to die, she informed her doll, but mamma said she was naughty not to want to do as they wished. All this had come from her hearing the coincidence of her cousin's death, and the having had her picture taken just before, spoken of when on the floor with her blocks. The dear child had been adjudged willful and disobedient, when only ignorant and frightened.

We should do well, many times, to regard wrong-doing as a symptom and not a diseased condition, and endeavor to do as the good physician does—seek to discern and remove the irritating cause. In order to do this you must live with the children in the child's world, entering into their kingdom in as humble and teachable a spirit as a little child. You can then gain their trust and confidence, and will thus become their refuge and strength; and they in return will be your song of rejoicing, your crown of glory, your exceeding great and precious reward for time and eternity.

#### MAPLE-SYRUP LABELS.

In Ohio the law provides that every gallon of maple syrup offered for sale must be labeled, and bear the name and address of the producer. This is a precaution to guard against adulteration. We are prepared to furnish syrup-labels as follows: 3x5, to fit panel on can, with name and address printed—100, 40c; 15c per 100 after 1st 100. Postage, 5c per 100. Long enough to wrap around the can, 10c per 100 extra, and postage double the above.

#### OUR SEED AND POTATO CIRCULAR.

Send for seed catalog and potato circular. We have a nice stock of seed potatoes that we are offering at exceptionally low prices, while they last. We would call the attention of our Canadian subscribers to the fact that the postage on seeds to Canada is 1c per oz., and ask them to kindly send us 17c postage for their premium potatoes instead of 9c, as our home subscribers are asked to do.

We have also added to our list of table beets the well-known Edmund's Early beet. This is handsome in shape, and a blood-red color, and has given the best of satisfaction in eastern markets. Price 5c per oz., 30c per pound; postage 9c per lb. extra.

#### BLACKWALNUTS AND SHELLBARK HICKORYNUTS.

We would again call the attention of our readers to the fact that we have nice blackwalnuts, already hulled, that we are offering at the low price of 15c per peck, or 50c per bushel. Nature has been bountiful in her gifts to us the past year, and the long winter evenings we are now having afford us a time for the enjoyment of some of them. These

nuts can be included with other goods by freight at a trifling cost for transportation.

We have also succeeded in getting track of another small lot of shellbark hickorynuts, which we can offer, while they last, at 50c per peck or \$1.60 per bushel. Send in your order early before they are all taken. Walnuts and hickorynuts are not a bad dish together.

#### HUBBARD SECTION-PRESS.

There are a great variety of devices for the purpose of putting together the one-piece section. Many have been submitted to us for trial. Among them all the Hubbard section-press stands unapproached in simplicity, ease of operation, effectiveness, and rapidity. Our help have repeatedly folded a box of 1000 sections in forty minutes, without breaking more than one or two. The bee-keeper who uses 5000 to 10,000 sections and over can not afford to be without one of these presses. They are adjustable for various sizes, but are, of course, sent out set for the 4½ sq. section. We have so much confidence in the press, that, having the opportunity offered us recently, we secured the patent from Mr. G. K. Hubbard, now of Riverside, Cal. We now have exclusive right to manufacture, and shall be pleased to supply other dealers in bee-keepers' supplies who will list them in their catalogs.

#### HONEY MARKET.

We have engaged, and offer for sale at very favorable prices, the following lots of comb honey, and shall be pleased to hear from any interested.

100½ lbs. No. 1 white, in 24-lb. cases, in New York State. Will sell in 200-lb. lots at 12c, or the lot for 11½ cts.

600 lbs. fancy white clover in 12-lb. cases, and 200 lbs. buckwheat, in 12-lb. cases. Will sell the latter at 8½c for the lot—the clover in 200-lb. lots at 13c, or the lot at 12½ cts.

We have also three lots in Michigan, consisting of 1500 lbs. fancy and No. 1 white, in 12 and 16 lb. cases, which we offer at 12c per lb. in 200-lb. lots.

1500 lbs. amber, which we offer at 10c per lb., and 500 lbs. buckwheat, which we will sell at 8½c per lb. in 200-lb. lots, or 8c for the lot.

Of extract d honey in stock here we offer two 60-lb. cans of Florida mangrove honey at 6c per lb.; 5 cases choice Texas honey at 6c by the case; what we have left of alfalfa (a few cans) at 6c per lb. by the case, or in 1-gallon cans, 6 in a case, at \$4.50; choice willow-herb in 60-lb. cans, 2 in a case, at 7c; some good amber honey at 5c. We have also a barrel, 500 lbs., of amber honey, in New York State, which we offer at 4½c per lb., and some buckwheat honey in 60-lb. cans at 4½c by the case of 2 cans. Choice basswood honey in Wisconsin, in 500-lb. barrels, is offered at 5½c, and in 60-lb. cans at 6c. Samples of any of these lots mailed to those interested.

#### SPECIAL PRICES TO CLOSE OUT STOCK.

We have in stock at Baltimore, Md., the following items of stock which we desire to close out, and are willing to do so at a special price rather than have it returned. If you can use any of it let us hear from you promptly; or, if more convenient, call on or write to Rawlings Implement Co., 209 So. Charles St., Baltimore, Md.

Six 10-lb. boxes extra thin foundation, offered at \$5.00 a box.

Three 20-lb. boxes light brood foundation, L. size, offered at \$8.00 a box.

2 crates, 50 each, 24-lb. single-tier shipping-cases, no glass, paper, or nails, \$4.00 a crate.

1 crate, 50 12-lb. single-tier shipping-cases, no glass, paper, or nails, \$2.50 a crate.

100 winter-cases which we will sell at \$5.00 for 10 or \$40.00 for the 100.

10 cases of two 5-gallon sq. cans, offered at \$6.50.

70 one-gallon square cans, offered for \$6.30.

3 comb-buckets, offered at \$1.00 each.

2 Hubbard section-presses, at \$2.25 each.

5 Swiss wax-extractors, offered at \$2.25 each.

3 sheets 28x96 zinc, at \$1.10 per sheet.

These are, of course, special prices, offered only while they last.

We have also at Good Hope, Ohio, the following nailed and painted hives, made a few years ago:

4 No. 1 Dove, hives with flat covers, and 2 with gable covers, complete, offered at \$1.00 each, or \$5.00 for the 6.

6 No. 11 Dove, chaff hives, complete, at \$1.50 each, or \$7.50 for the 6.

1 No. 7 Simp, hive, two-story, for \$1.00.

# SYRACUSE SUSPENSORY SUPPORTS

and protects the scrotum, and should be worn in  
 every case where there is any drooping of the scro-  
 tum. It is especially recommended to wheelmen,  
 equestrians, base ball, foot ball and lawn tennis  
 players, athletes, men doing heavy work, much  
 walking or standing, etc. Ask your physician's ad-  
 vice about wearing a Suspensory—perhaps it will  
 relieve your backache. Our \$1.00 grade is very pop-  
 ular, and your dealer, or we, will sell you one and  
 refund money if not perfectly satisfactory. For  
 sale by all druggists and dealers in athletic goods.  
 Send for price list. **A. J. WELLS MFG. CO.,**  
 250 Tallman Street, Syracuse, N. Y.

# Maple-sugar Supplies.

The time is at hand when those who produce the delicious sweets from the sugar maple must be getting ready. For the best results you must have good clean apparatus of the most approved type, and you really can not afford not to read Prof. Cook's book, "Maple Sugar and the Sugar-bush," which we furnish at 35c, or we will give a copy free to all those who buy sugar-makers' supplies of us to the amount of \$10 or more. We do not sell evaporators, but think we can do you some good on spouts, pails, covers and cans. Our tin pails and cans are made of American tin-plate. The plates are tinned and made up into cans by the same firm; and by buying carload quantities we get them at bottom prices. See table below. The pails and cans are machine-made, far superior to hand-made, and guaranteed not to leak.

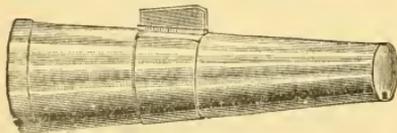

BUCKET WITH HINGED TIN COVER.

[This cut shows the manner of hanging the bucket on the spout, and also the manner of emptying with the hinged tin cover. Most progressive sugar-makers nowadays use covers of some kind.

Record hinged tin covers..... \$5 00 per 100.  
Reversible woodcovers..... 3 50 per 100.

RECORD SAP-SPOUT.

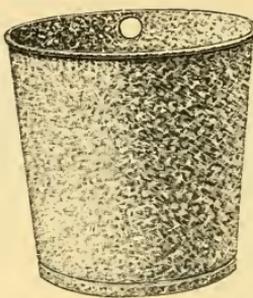

This spout is cheaper than any other made, and we believe it is as good as any, if not better. It is used almost exclusively in this section. Price \$1.00 per 100.

TIN SAP-BUCKETS.

Grade of tin.	Price per 100.	10-qt.	12-qt.	15-qt.
IC charcoal sap-buckets.....	\$13 50	\$14 50	\$17 50	
IX charcoal sap-buckets.....	15 50	16 50	18 00	
IC coke-tin sap-pails.....	12 00	13 00	15 00	
IX " " " ".....	14 00	15 00	17 00	

The sap-pails in above table, of coke-tin, are offered to compete with other cheap buckets you will find in the market. The tin in these cheap pails is just the same as in the better ones, except the coating, which is much thinner. We guarantee these equal or superior to the other cheap buckets in the market, but recommend, instead, the higher-priced ones with better coating; or, better yet, the galvanized. All the galvanized buckets, as well as the 10-qt. tin ones, have holes punched like cut below, while other tin buckets have wire loops.

We are offering a special bargain this year in galvanized-iron buckets. These are by far the strongest and most durable bucket made. The blank steel is cut out and made up into pails, and then the whole is dipped into molten metal, and coated all over, inside and out. All seams are filled up so they can not leak, and rust has no chance to work on them anywhere. If you want any thing better

than the I C tin, the galvanized bucket is the one to select. There is only one objection to them, as compared with tin. The surface is somewhat rougher than tin, and therefore they are not quite as easily cleaned. This is a slight objection as compared with the greater strength and durability of the pails.

Price, 10-qt. galv., \$14.50 per 100; 12-qt., \$16.00 per 100; 14-qt., \$17.50 per 100.

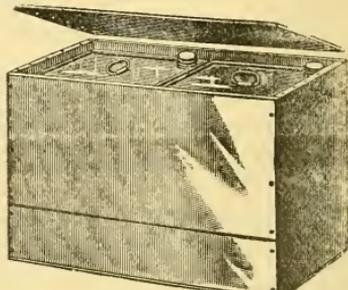

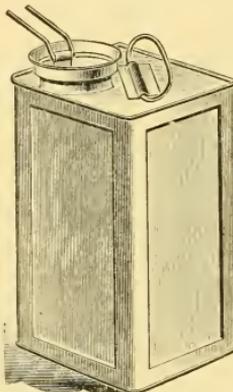

ONE-GALLON SQUARE CANS.

This is the favorite package for syrup; being square, it will pack in the smallest space. Our cans this year all have the 2 inch, lever-seal cap as recently described, and shown in cut opposite. They are warranted not to leak, which is more than you can say of home-made cans.

Price, 1-gal. square cans, with lever seal, \$9.00 per 100; 6 in a box, 80c per box; \$7.50 for 10; 10 in a box, \$1.25 per box; \$11.50 for 10.

½-gal. cans, 2-inch, lever-seal cap, \$7.50 per 100.

¼-gal. cans, 2-inch, lever-seal cap, \$6.50 per 100.

FIVE-GALLON SQUARE CANS.

These are largely used for storing and shipping honey, and for that purpose there is nothing better. Many also use them for syrup, as they cost less per gallon. They are also furnished from Medina with 2-in., lever-seal cap, or 1½-in. screw cap as preferred.

PRICE LIST.

5-gal. cans, 20 in a box, @ 26, \$5.30.  
5-gal. cans, 2 in a box, 70 c; 10 boxes, \$6.50.  
5-gal. cans, 1 in a box, 45c; 10 boxes, \$4.00.

The A. I. Root Company,  
Medina, Ohio.

## CONVENTION NOTICES.

The annual meeting of the Ontario Co., N. Y., Bee-keepers' Association will be held at Canandaigua, N. Y., Jan. 29, 30, 1897. A cordial invitation is extended to all interested.

RUTH E. TAYLOR, Sec., Bellona, N. Y.

The Illinois State Bee-keepers' Association will meet at the State House, Springfield, Feb. 24, 25 1897. The State Farmers' Institute and also the State Live-stock Breeders' Association meet at the same time and place. The Legislature will then be in session, and we hope to have such a showing, and such an influence upon it as to secure the passage of a bill that will put an end to the adulteration of honey in our State—the greatest evil that exists, to the detriment of bee-keepers. The railroad rates will be announced later. Good meals can be secured at 25 cts. Program later.

J. A. STONE, Sec.  
Bradfordton, Ill.

## KIND WORDS FROM OUR CUSTOMERS.

I am very much interested in Anderson, the bee-keeper.  
Dillburgh, Ala., Dec. 29. C. C. L. DILL.

Have Rambler write another story when this one is done. We like it very much.  
Montague, Mass., Dec. 21. F. C. FULLER.

GLEANINGS is indispensable in my home. The children are interested in the story of Fred Anderson, and I find instruction in bee culture and gardening. I expect to be a subscriber as long as I live. You have my very best wishes for your future success.  
Oakland Mills, Md., Dec. 28. GEO. W. GEASLEN.

*Friend Root:*—I have been thinking of writing you a letter the past year or so, and tell you what GLEANINGS has done for me, or helped to do. Your good talk first set me to thinking. I first had a few stands of bees, about 19 years ago, so I wanted a bee-journal. Mr. Muth advised me to take GLEANINGS. I did, and have never regretted it. I think I have missed getting only one number in all this time. I expect to take it as long as I am able to read. When I commenced to read it I was an unbeliever, and cared for nothing but worldly gains. I became interested in the Home Papers, and read all of them; and between times I would read the Bible, and so got to going to meeting, and finally joined the church, and am trying in my poor way to serve the Master. Brother Root (for I do want to call you "brother"), I have not told you all that I can thank GLEANINGS for. When I first began to read it (I am sorry to say) I was addicted to strong drink, and a perfect slave to tobacco. I have been fighting the suloon with all my might for the last 12 years; and if the Lord spares me until the 17th of April next it will be 5 years since I tasted tobacco in any way, so I can thank the Lord and GLEANINGS that I have conquered the two great evils of man.

May God spare you many years that you may go on with your good work.  
Morristown, Ind. MAD. TALBERT.

**8 QUARTS Black INK \$1.**

Send 6 cents for 1/2-PINT sample.

Handy Mfg. Co., 432 Lafayette Ave., Detroit, Mich.

**A  
Large  
Book  
Free!**

To every new subscriber who sends us \$1.00 we will send him our journal, **Gleanings in Bee Culture**, one year, and the book by A. I. Root, containing 190 pages, the size of this, entitled **What to Do, and How to be Happy while Doing it**, postpaid. The regular price of this work is 50 cents. If you prefer, the journal may be sent to a friend, and you can keep the book for yourself.

## Honey Column.

## CITY MARKETS.

**SAN FRANCISCO.**—*Honey.*—Fancy white, 10@11; No. 1 white, 9@10; fancy amber, 7@8; No. 1 amber, 6@7; fancy dark, 5@6; No. 1 dark, 4@5; white extracted, 5½; amber, 4½@4¾; dark, 2¾@3; beeswax, 24@25. The demand is not active for honey nor beeswax, but stocks very light. HENRY SCHACHT, San Francisco, Cal.

**CHICAGO.**—*Honey.*—Fancy white, 13; No. 1 white, 12; fancy amber, 11; fancy dark, 10; No. 1 dark, 9; extracted, white, 6@7; amber, 5@5½; dark, 4@4½; beeswax, 26@27. Demand not very active. Stocks light. S. T. FISH & CO., 189 South Water St., Chicago, Ill.

**CLEVELAND.**—*Honey.*—Fancy white, 11@12½; No. 1 white, 10@11; fancy dark, 7@8; white extracted, 6@7; amber, 4@5; beeswax, 24@27. Honey is moving very slowly in our market. There seems to be but little call for it. WILLIAMS BROS., 80 & 82 Broadway, Cleveland, O.

**KANSAS CITY.**—*Honey.*—Fancy white, 14; No. 1 white, 13@14; fancy amber, 12@13; No. 1 amber, 11@12; fancy dark, 10@11; No. 1 dark, 8@9; white extracted, 6@6½; amber, 5@5½; dark, 4@4½; beeswax, 25. C. C. CLEMONS & CO., 423 Walnut, Kansas City, Mo.

**CHICAGO.**—*Honey.*—Fancy white, 12@13; No. 1 white, 10@11; fancy amber, 8@10; No. 1 amber, 7@8; fancy dark, 8; No. 1 dark, 7; white extracted, 5@7; amber, 5@6; dark, 4½; beeswax, 25@27. Very little activity in the market. R. A. BURNETT & CO., 163 So. Water St., Chicago, Ill.

**BOSTON.**—*Honey.*—Fancy white, 13; No. 1 11@12; white extracted, 7@8; amber, 5@6; dark, 4@5; beeswax, 25. Comb honey in fair demand, with good supply of No. 1. Fancy 1-lb. cartons wanted. Good demand for extracted, with light supply of light amber and white. Beeswax in good demand, with light supply. We advise shipments. E. E. BLAKE & CO., Boston, Mass.

**ALBANY.**—*Honey.*—Fancy white, 12@13; No. 1 white, 11@12; fancy dark, 7@8; No. 1 dark, 6@7; white extracted, 5@6; dark, 4@4½. The demand for comb honey continues very slow, even at lower prices. There is some inquiry about extracted, but few sales yet. Ample stock on hand. CHAS. McCULLOCH & CO., Albany, N. Y.

**MINNEAPOLIS.**—*Honey.*—Fancy white, 11@12; No. 1 white, 10@11; fancy amber, 9@10; No. 1 amber, 8@9; fancy dark, 7@8; No. 1 dark, 6@7; white extracted, 6@7; amber, 5@6; dark, 4@5; beeswax, 22@25. Market steady and quiet since the holiday season, and quotations nominal. Extracted is in occasional demand, and choice comb fairly well cleaned up. S. H. HALL & CO., Minneapolis, Minn.

**MILWAUKEE.**—*Honey.*—Fancy white, 12@13; No. 1 white, 11@12; fancy amber, 10@11; No. 1 amber, 9@10; white extracted, 6@7; amber, 5@6; dark, 4@4½; beeswax, 25@26. The demand for honey is not very brisk—market dull, sales drag, and values are hard to maintain; but we hope improvement may yet come. But honey is a luxury, and not everybody can enjoy it, even at low prices. We trust our next report may be more cheering. A. V. BISHOP & CO., Milwaukee, Wis.

**NEW YORK.**—*Honey.*—Our market remains quiet and inactive for all grades of honey, both comb and extracted. There is quite a stock on the market, and unless we have a good spring trade some of it will be carried over. Fancy white, 11@12; fair white, 9@10; buckwheat, 7@7½; extracted white, 5@5½; buckwheat, 4; southern, 50 c per gallon. Beeswax quiet at 25@26. HILDRETH BROS. & SEGELKEN, 28 & 30 W. Broadway, New York.

**DETROIT.**—*Honey.*—No. 1 white, 11@12½; fancy amber, 10@11; No. 1 amber, 9@10; fancy dark, 8@9; white extracted, 5½@6; amber, 5@5½; beeswax, 25@26. M. H. HUNT, Bell Branch, Mich.

**PHILADELPHIA.**—*Honey.*—No. 1 white, 9@10; fancy amber, 7@8; No. 1 amber, 7; No. 1 dark, 7; white extracted, 5½@6; amber, 4@5; dark, 3¾@4; beeswax, 25. WM. A. SELSER, No. 10 Vine St., Philadelphia, Pa.

**CINCINNATI.**—*Honey.*—Fancy white, 12@14; No. 1 white, 11@13; No. 1 amber, 10@12; white extracted, 5@7; amber, 4@6; dark, 3¾@4; beeswax, 22@25. CHAS. F. MUTH & SON, Cincinnati, O.

**DENVER.**—*Honey.*—Fancy white, 11; No. 1 white, 10; fancy amber, 9; white extracted, 5@6; beeswax, 25. There seems to be a little better demand for extracted. R. K. & J. C. FRISBEE, Denver, Col.

Extracted honey, fine linn, new crop; cheaper than the cheapest. J. B. MURRAY, Ada, O.

FOR SALE.—10 more 100-lb. kgs of buckwheat honey at 4 cts. per lb. f. o. b. cars. The lot at 3¾. N. L. STEVENS, Venice, Cayuga Co., N. Y.

FOR SALE.—600 lbs. extracted honey, in new cans and cases, \$375.00. Speak quick; who wants it? ELIAS FOX, Hillsboro, Wis.

FOR SALE.—A carload of white extracted honey from basswood and willow-herb in 30-gallon barrels and 60-lb. cans. Purity and safe arrival guaranteed. Price 6½ cts.; in quantity, 6 cts. FRANK MCNAY, Mauston, Wis.

FOR SALE.—Ten barrels good white-clover extracted honey at prices to suit the times. Can put it up in any style of package desired. Write for price, stating quantity wanted. Send stamp for sample. EML J. BAXTER, Nauvoo, Hancock Co., Ill.

FOR SALE.—Extracted buckwheat honey, in kegs of 160 lbs., at 4½c per lb. J. F. MICHAEL, Greenville, Ohio.

## See what **NEW SUBSCRIBERS** are **Offered.**

New subscribers are what every journal most earnestly desires. As a matter of course, if the journal is good, most of the old subscribers will stay by it; but to get *new* subscribers, to get the journal into the hands of *new* men, that they in time may thus become old subscribers, is what every journal strives for most earnestly. To this end I make the following offers. For \$1.00 I will send the **Bee-keepers' Review** for 1897 (and throw in the December, 1896, number, which is especially good) and the 50-cent book, "Advanced Bee Culture," or in place of the book, 12 back numbers of the **Review**. For \$1.50 I will send the **Review** and a fine, tested, Italian queen—queen to be sent early in the season of 1897. For \$2.50, the **Review** and 1000 No. 1 first-class one-piece sections. But, remember, these offers are only to those who are not now subscribers to the **Review**, and as a special inducement for them to try the **Review** at least one year.

W. Z. HUTCHINSON, Flint, Mich.

### It is here.

The year 1897 is here, and we are happy to inform our friends and customers that we are now better prepared than ever before to fill your orders for queens and bees. We have the largest stock ever operated by us, and we mean to be ready with plenty of bees and queens to fill all orders without delay that are sent to us.

Bees by the pound, \$1.00; ten or more pounds, 90c each. Untested queens for 1897, \$1.00 each in February, March, April, and May; \$5.00 for six, or \$9.00 per dozen. For larger amounts write for prices. Have your orders booked for your early queens. Safe arrival guaranteed.

Root's goods, Dadant's foundation, and Bingham smokers. A steam bee-hive factory, and all kinds of bee supplies.

The **Southland Queen**, the only bee-paper in the South, monthly, \$1.00 per year.

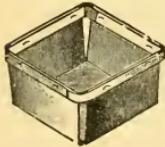

Send for catalog, which is almost a complete book on Southern bee-keeping, giving queen-rearing in full, all free for the asking. If you want full information about every thing we have, and the bee-book, don't fail to ask for our 1897 catalog.

The **Jennie Atchley Co.**,  
Beville, Bee Co., Texas.

### Fruit Packages of all Kinds,

Also

### Bee-keepers' Supplies.

We allow a liberal discount on early orders. Why not send for your supplies now to save the discount and avoid the rush of the busy season? Catalogue and price list free. Address

**BERLIN FRUIT-BOX CO.**,  
Berlin Heights, Erie Co., Ohio.

### CHOICEST STRAWBERRIES

Send for it. CATALOG FREE TO ALL.  
C. N. FLANSBURGH, Leslie, Mich.

**SWEET-CLOVER SEED** in the hull at 4 cents per pound. Address **JOSEPH SHAW**,  
Box 64, Strong City, Kansas.

### Cut This Out.

If you buy honey, have it analyzed and see if it is pure. I have purchased chemical apparatus costing \$300, for the special purpose of analyzing honey. Will give a written certificate that will stand in court. Send a 3-oz. bottle and \$1.50 by mail to

Wm. A. Selser,  
10 Vine St., Philadelphia, Pa.

### The Danzenbaker Hive

Has valuable features possessed by no other, and is surely winning its way; was awarded Special Diploma, and First Premium for **COMB HONEY**, at Mich. State Fair, 1896. Address **Francis Danzenbaker, Medina, Ohio.** Care The A. I. Root Company.

### Are You Going to Buy Apiarian Supplies or Bees?

If so, You Want the Best.

This is the only quality we keep. Our prices on them are low, and our 1897 circular describing them is yours for the asking. We keep in stock several carloads of supplies, and can ship promptly.

Apiary,  
Glen Cove, L. I.

I. J. STRINGHAM,  
105 Park Pl., N. Y. City.

**One Cent** Invested in a postal card will get my large catalogue of all Root's goods. Can save you money. **M. H. HUNT**,  
Bell Branch, Mich.

## 160-page Bee-book Sent Free with American Bee Journal.

Bee-book

FREE.

Every *new* subscriber sending \$1.00 for the *weekly American Bee Journal* for 1897 will receive a copy of Newman's 160-page "Bees and Honey" free. Ask for sample copy of the *Bee Journal*, and have your subscription begin with January 1. The *old American Bee Journal* will be great this year. You ought to have it, even if you do take *GLEANINGS*. The two papers together for \$1.90 (and book thrown in, to *new* subscribers. Address

**GEORGE W. YORK & CO.**, 118 Michigan St., Chicago, Ill.

In writing advertisers please mention this paper.

# GLEANINGS IN BEE CULTURE

A JOURNAL DEVOTED TO BEES AND HONEY AND HOME INTERESTS.

ILLUSTRATED SEMI-MONTHLY

Published by THE A. ROOT CO. MEDINA, OHIO.  
\$1.00 PER YEAR.

Vol. XXV.

FEB. 1, 1897.

No. 3

## STRAY STRAWS

FROM DR. C. C. MILLER.

A CORRESPONDENT wants a recipe for curing pork with honey. Who knows how?

EDITOR YORK says that, as nearly as he can discover, there were 1,200,000 pounds of honey put on the Chicago market last year.

THE *Progressive Bee-keeper* now flings at its mast-head the name of G. M. Doolittle as one of its editors. If that isn't *progressive*, I don't know what is.

THAT'S A SHABBY TRICK played on the readers of GLEANINGS by Walter S. Pouder, p. 67. He says, "See that wink?" and as long as I watched that girl she never winked once.

THE ROYAL AGRICULTURAL SHOW, to be held at Manchester next June, is beginning to stir British bee-keepers. A large number of prizes are offered to bee-keepers, ranging from \$1.25 to \$75.00.

IT'S ALL RIGHT to encourage the invention of new hives and new appliances, but at the same time it's a kindness to say to every beginner who has kept bees only one season, "Don't invent a hive just yet."

THIS WINTER is a bad one for me in one respect. I have 10 colonies wintering outdoors as an experiment, and the winter is so mild up to the middle of January that hardly any colony would be fool enough to die on its summer stand.

EDITOR THEODOR WEIPPL, after quite a discussion in *Biener-Vater* as to the standing of the swallow, gives his verdict against it as an enemy of bees. On cloudy, rainy days its frequent visits to the hives mean death to some of the workers.

HONEY-AND TAR COUGH-CURE. Put into boiling water a shallow tin dish containing a tablespoonful of tar. When the tar is hot, add a pint of extracted honey, and stir well for half an hour, adding to it a level teaspoonful of pulverized borax. Keep in a bottle well corked. Dose, a teaspoonful every 1, 2, or 3 hours, ac-

ording to severity of cough.—*Dr. Petro, in American Bee Journal.*

P. SCHACHINGER estimates that, when a colony of 20,000 bees stores a pound of honey a day, a colony of 40,000 will store 4 pounds. Twice as many bees, four times as much honey. [I believe that most of our American bee-keepers would consider this as a fair ratio.—ED.]

VERY DECIDEDLY a package of honey to retail at a dime is a good thing, provided we can get the bees to store as much honey in such light sections. For some time I've been advocating a section so light that it will be impossible for a dishonest grocer to sell it for a full pound. [See answer to another Straw on this subject.—ED.]

EDITOR VOGEL says the bee-larva is fed 12 times in 24 hours, or once every 2 hours. If there is never any superfluous food in a worker-cell, it seems a pretty safe deduction that worker brood can not be kept away from the bees longer than 2 hours without injury. Indeed, a much shorter time might hurt; for the 2 hours of some of the little chaps might be up just about the time of removal from the hive.

THE *San Antonio Express* reports that "experiments made with smallpox patients in Oaxaca, Mexico, show that, by administering honey diluted in water to smallpox patients, the pustules of the worst variety disappear, and the fever is immediately diminished." If that isn't a newspaper yarn it's worth knowing. [I saw this item, but jumped to the conclusion that it was a newspaper yarn, without any real foundation. If any of our subscribers can enlighten us, I should be glad to have them do so.—ED.]

THE *American Bee Journal* starts out with the new year by turning over a new leaf in the way of reform. When "ed" has the sound of "t" in the past tense and participle, "t" is printed. *Progressive* also talks about clipt and unclipt queens. Any movement to help our abominable spelling ought to be hailed with delight; but at first a good many will not be "shockt." [Yes, it certainly is a move in the able to meet the new spelling without being

right direction, and the editors of GLEANINGS have seriously considered the same move. If Bro. York's subscribers do not protest, we may follow suit.—ED.]

"IT COSTS TWO POUNDS of honey to rear one pound of brood; and as a Langstroth frame is capable of containing two pounds of brood, I hold that one such frame of brood costs four pounds of honey." That's R. L. Taylor's notion in *Review*, and I'll pin my faith to it till something different is proved. And I suppose a frame of *drone* brood costs about five pounds of honey. [Nothing unreasonable or improbable in this; if, therefore, it does cost 2 lbs. of honey to rear a pound of brood, bee-keepers should be careful not to allow brood-rearing to go on out of season. The thrifty Italians will seldom if ever waste their energy in this way.—ED.]

IT IS A NEW THING to me that "bees will not work upon a section with full-depth cells as readily as they will upon new foundation," as stated by friend Martin, p. 43. I know that my bees *have filled* full-depth cells many a time before working new foundation, when the yield is poor, and they always commence on the full-depth cells first. If B. Taylor were alive I think he would deny that he used the leveler because he wanted shallower cells. Friend Martin, wasn't there something wrong with your full-depth sections? [We tested this matter pretty carefully in our apiary last summer, and *invariably* the bees took the drawn comb first, then afterward the foundation. What I mean by "drawn comb" is some that had been leveled down to cells about  $\frac{3}{8}$  in. deep. This seems to have been the experience of the great majority of other bee-keepers.—ED.]

PROF. COOK is getting to be revolutionary. He says in *Am. Bee Journal* that he thinks a swarm never goes with a young queen when she goes forth to mate. That in all such apparent cases it was merely a swarm issuing, and the queen accompanying or following. I wonder if that's another of the things we didn't know but thought we did. [Prof. Cook may be right, but it does not look reasonable—to me at least. Time after time I have seen young nucleus swarms go out with a young queen not yet fertilized. In some instances, according to my observation, they come back with the queen. Their very small quarters, I have thought, made them discontented; and when the queen went out they simply "lit out" with her, probably assuming that any quarters would be more agreeable than the ones they were having, so cramped up.—ED.]

A QUIET SMILE, I fancy, must spread over Prof. Cook's face as he notes how a late article of his is having the commendation of the bee-journals, in which he says the bees "digest" nectar, and then remembers what a howl was sent up when he made the same statement once

before. It's not safe, professor, to get too much ahead of the times. I remember a man getting into trouble once because he said a bee-keeper ought to have legal control over the territory his bees occupied. He merely said it a few years too soon. [Yes, the renowned Galileo got a little ahead of the times, and they made him recant; but he was of the same opinion still. On the subject of digested nectar I do not think GLEANINGS ever took issue with Prof. Cook. While perhaps we did not indorse him at the time, we did later on. More and more the facts go to show that bees do actually prepare nectar in such a way as to make it more easily assimilated by human beings than ordinary sweets. In my own case, for instance, I can eat honey without any inconvenience; but I can not eat cane or maple-sugar syrup. This I know to be true of a good many others. I do not, however, think, as some do, that an admission that bees convert or change sweets is also an admission that sugar honey is a legitimate article of sale, for this reason: Raw nectar, as it is gathered from the flowers, is taken very slowly, a little at a time, and is digested by the bees. Syrup, as it is ordinarily fed to the bees, is taken so rapidly that they have little time to prepare it or digest it, therefore sugar honey should not in any sense be classed as honey. In talking with Mr. R. F. Holtermann, of the *Canadian Bee Journal*, this week, I found he was of the same opinion.—ED.]

I'M DISCOURAGED—almost. You box my ears, Mr. Editor, on p. 42, for *persisting* "in saying the plan of selling thin sections is thievish," right after my saying, "I'm for thin sections just as much as you," and when I never for a minute thought it was thievish to sell them. [I should not be surprised, doctor, after we get through talking, that we shall be found to be actually on the same side of the fence. I do not think I misunderstood you; but unwittingly I made you, perhaps, stand sponsor for things which you did not; but in your previous Straw on this subject you say you are condemning "the thievish plan of selling light-weight sections for *full pounds*"—italics mine. It seems to me right here you are going on the wrong assumption that light weights are sold for *pounds* even generally; and you very properly say that retailers selling such for pounds are dishonest. Right here we surely agree, if not on all. But from the best information I can get, retailers almost universally sell by the *piece*; in fact, I do not believe that consumers or purchasers have any idea of the weight of a section. It is the price and not the weight that is prominent in their minds; hence I can not see *how* there can be any thing thievish about selling light-weight sections, for the average consumer, when he buys honey, does not have in mind a pound but a certain chunk of honey which he sees before him.—ED.]

### DRAWN COMB.

ITS VALUE TO THE BEE-KEEPER; SPRAYING TREES DURING BLOOM PROHIBITED IN VERMONT.

By *J. E. Crane.*

I have noticed with considerable interest the discussion in GLEANINGS in regard to the use of drawn comb. I have used such comb more or less for the past thirty years, and do not think the estimates of its value are at all too high. There are two or three advantages: The bees will fill them quicker, commence working in the sections sooner, and, if a row is placed on the outsides of the clamp in the first part of the honey season, these will be filled and finished nearly or quite as soon as those filled with foundation in the center of the clamp.

A little care should be used to produce the best or fancy combs of honey with these drawn combs. They should all be cut down if they are more than one-half or three-fourths inch thick. If not cut down, the bees hesitate about sealing them; and when sealed they are very apt to have a soiled or dirty appearance.

After the honey is extracted from such combs in the fall I place them in clamps and put them on top of some hive so that all the honey may be taken out dry and clean by the bees; for if any is left, the next crop of honey when put into these cells is more apt to granulate.

I much prefer a knife for this purpose to melting them down, as the center of the comb is very liable to be quite to one side of the center of the section; and with a knife fitted for the work, one can cut down 200 per hour or more. I like to cut them down so as to leave the lower edge thinner than the upper part of the comb, so as to be nearly as the bees would build a thin comb. I like a Bingham & Hetherington honey knife for cutting down, fitted for the work by first cutting the kulle down or off nearly one-half its length, and beveling the edge square across like the sides. I have several thousand such combs cut down and carefully stowed away for next year's use.

Inclosed find copy of a law recently passed by our Vermont Legislature. Such a law should be on the statute-books of most of our Northern States. Spraying apple-trees while in bloom has done our bee-keeping much harm here in Vermont. The law reads:

It is hereby enacted by the General Assembly of the State of Vermont:

SEC. 1. If a person sprays or causes to be sprayed, or puts or causes to be put, any Paris green, London purple, or other poisonous substance upon fruit-trees while in blossom, he shall be fined not more than forty dollars, and not less than ten dollars.

SEC. 2. This act shall take effect from its passage.

Approved November 20 896.

Middlebury, Vt., Dec. 23.

[The comb-leveler put out by the late B. Taylor, so far as I am able to gather from those

who have tried it, levels the comb down perfectly, clear across their bases. I do not see how a knife could do it as quickly or as well; but perhaps it does.

The Vermont law is brief and to the point. Michigan already has a similar law, and several other States are moving in the same direction. All it needs is for bee-keepers to properly instruct their legislators to give similar laws for every State. If a law were once on the statute-book it probably would never have to be enforced. Its moral influence would be sufficient to prevent spraying at the wrong time of the year—ED.]

### DRAWN COMBS FOR SURPLUS-BOXES.

WORK IN THE BOXES BEGUN SOONER; PREVENTION OF SWARMING.

By *F. A. Snell.*

This subject of drawn combs has received much attention the past few years, and it is an important matter; and as I have had some experience along this line I will give some of my ideas. There is no doubt in my mind as to these combs being valuable to a certain extent. In each row of sections I very much wish to have about three of the central ones contain drawn combs, to be put on each hive run for comb honey at the opening of the surplus-honey flow. I find work is begun sooner than when only foundation is put in. All colonies will begin sooner, and with some a difference in time of a week or more. In others it will make a difference of swarming or no swarming for the season. The apiarist with long experience is aware of this. A point that no comb-honey producer should overlook is that of getting his bees started in storing in the supers; and every inducement should be made to this end so as to secure such. Once well at work in the boxes, more supers added at just the right time will do very much to prevent the swarming impulse, and thus secure the largest possible amount of surplus honey.

These supers, with the central drawn combs, should be put on a little before there is a probability of there being honey stored in them—say three or four days. Never be too late in doing this work, or the swarming-fever may have taken possession of the bees, and then it is too late; for swarm they then will if the honey-flow be a good one. These drawn combs should not be over 1½ in. thick, I think, as the outer ends of the cells should be made from new comb. My experience has been that comb honey is nicer where the comb is newly built, and I have often sampled that of the two and compared the quality. With me the new is always preferable in both comb and honey. I should not like to dispense with the central drawn combs, nor use such in all boxes.

One thing I have often observed, that I have no remembrance of seeing mentioned, is this:

Some combs in the supers are built very thick at base and side walls; others at other times

will be made thin. I think the reason is this: During a good honey-flow the bees wish the wax secreted to go as far as possible in holding the honey being so freely gathered. At other times, as the flow for honey is slacking up after a good yield, the workers, having a very large amount of comb material at hand, and little need of comb, build the combs very heavy, seemingly to save the secreted wax. Such combs are often very heavy, and should be well cut down if used in the supers. I believe, as the queen is crowded for room at the opening of the honey-flow, that the bees remove some of the honey from the brood-chamber, and store it in the drawn combs in the supers; whereas the newly built comb is filled with newly gathered honey, which would account for the better flavor of the latter when from clover or basswood bloom. I have many times noticed that the first extracted honey taken in June was not as fine in quality as that of the second extraction. I account for this the same as above mentioned. The combs being built, some honey was moved from the brood-chamber below, stored the previous autumn.

I have read the articles on drawn combs with much interest, as they have from time to time appeared in our bee-periodicals.

Milledgeville, Ill.

[Yes, I believe that, if drawn combs were given soon enough before the bees began to feel the need of more room, it will go a long way toward solving that vexatious swarming problem. Combs should not, I think, be anywhere near  $1\frac{1}{2}$  inches thick. If any thing, they should be less than 1 inch, and  $\frac{3}{4}$  would not be bad. All the bees require is a *good* start.—Ed.]

### DRAWN COMBS AND BAIT COMB.

ADVANTAGE OF DRAWN COMBS IN POOR SEASONS; A LARGE HIVE.

By E. H. Schaeffle.

I was under the impression that the use of drawn combs in securing comb honey in "off" years was common; but from late articles in GLEANINGS I see that it is new to many. The fact that bee-keepers working for extracted honey have a crop when comb honey is a failure should have suggested this to every one. That "bait" combs are a good thing, has been generally admitted. In the season of 1895 the honey-flow was very strong up to March, and the sections had their combs well drawn out, and many of them full, when the flow ceased and the bees emptied them of their entire contents. During the remainder of the season the bees just about made a living. This left me two thousand sections filled with comb. This season I put all of these sections on. The flow was very poor, but the sections with drawn combs were all filled, while no comb was made in any of the other supers, nor did any of the

other bee-keepers in the section (who make only comb honey) have a pound.

It has always been a question with me whether it pays to take comb or supplies from a strong colony to stimulate a weak one. Garfield once said that "a man who can't save himself isn't worth saving," and I sometimes think a colony of bees that has got too weak to help itself is not worth robbing a strong colony to feed it. To get drawn combs, the stronger colonies must be kept at comb-building, and in consequence no honey is secured from them; but for this I should like to have all bees at work filling and sealing over drawn combs. In a good season, when the bees "just roll in the honey," I don't see the need of a drawn comb, as every hive is then the equal of every other hive, and the bees are all of one mind and intent, and the favored bee-keeper has but to keep the "busy bees" supplied with empty sections as fast as the bees fill them.

Of one thing I am becoming more and more firmly convinced; that is, the conditions differ with the locality. A system that is a success in one section may be a dismal failure in another. For some time past I have been convinced that a large hive was best adapted to my section, and the past season I have tried a hive 18x18x36 inches. Over this I put one of equal size; and over that, one of half the size; and although it was an "off" year this hive did better than any hive in the apiary. Now, I don't intend to increase all of my hives to that size; but I believe we cramp our bees too closely, and I shall try a 12-frame hive the coming season.

Murphys, Cal., Dec. 26.

[I have given above three articles from bee-keepers who believe thoroughly in the use of drawn combs. I have more of them, and will give them later. In the mean time I should be glad to hear from others who have not yet written.

In the paper which I gave at the Lincoln convention, after enumerating some of the advantages of the drawn comb, some of which are given above, I expressed the hope that some Yankee genius would get up a machine that would make deep cell foundation or shallow drawn comb with cell-walls and bases as thin and delicate as the natural; but at the time, several expressed their doubts that any such thing could ever be made. For reasons that I will not now give, I did not then wish to make public the fact that we had *already* made in our establishment drawn combs, and had tested them during the previous summer in the apiary, and that the bees *accepted them at once*. This comb had cell-walls and bases nearly as thin as the natural, but the bases were flat. I showed samples of it to a few friends at Lincoln, and they could hardly believe that it had been turned out by machinery. Others, to whom we had sent samples a year ago, expressed the same feeling of surprise and pleasure. The bees not only accept this comb, but deposit honey in it immediately, draw it out and cap it over, and in some cases before they even *touch* foundation in sections next adjoining in the same super.

During all this time we have been working on larger machinery, but have hesitated about saying any thing in print until we could have some assurance that the new article was a commercial possibility. While we are not fully assured of it yet, we have turned out samples large enough to fill sections, and have sent them around to some prominent bee-keepers. We have received quite a number of letters, but will quote from only one of them. Here is what Hon. Geo. E. Hilton says:

*Mr. Root:*—The sample of new foundation comb has arrived, and it is simply *superb*. I believe it will produce comb honey that can't be beat. I have great faith in it. If it will give us plump well-filled sections, as I feel it will, the price will be no object. Fremont, Mich., Jan. 25. GEO. E. HILTON.

This is only a sample of a lot of other letters of a similar import. At present we are able to turn out only samples to illustrate the possibilities of the future. For 10 cts. in stamps we will try to mail every applicant a piece of the comb, providing we are not flooded beyond the capacity of our outfit. In the mean time we are at work on more elaborate machinery. Until we know what this can do, I will not say any more; suffice it, that we *hope* in the near future to be able to supply, to a limited extent for orders, drawn combs with cell-walls as thin as the natural, having flat cell-bottoms. And right here we found where the cell-walls were deep and as thin as the natural, that flat bases were as good as the natural bases, and far easier for us to make.

I need hardly add that the presiding genius in the evolution of the new deep-cell foundation is none other than E. B. Weed, of foundation fame. He has been working on the problem for years, but it was only within the last two years that he struck the right track. That he should stick and hang to this will-o'-the-wisp of artificial comb in spite of repeated failures, lack of funds, in the face of discouraging editorials in GLEANINGS, and other journals—well, the man should reap the rewards of his labor. But more anon.

Perhaps some may think there is nothing in drawn comb, providing we can make it. I felt so too, at first; but when I saw how the *bees* felt about it, I changed my mind. Mr. Weed was given the free use of the whole apiary to test his new comb, and he demonstrated beyond a doubt that the bees would fill it with honey *immediately*, and at the same time join on their own comb, making the whole one homogenous mass; and the only way in which the artificial could be detected from the natural was by the cell bottom—the artificial being flat.—Ed.]

## PRINCIPLES OF HONEY-CONSUMPTION; POSSIBLE APPLICATIONS.

### SUGGESTIONS FOR SMALL TWO-OUNCE HONEY-PACKAGES.

By F. L. Thompson.

The contrast between the average man's conception of honey as a delicacy, and his obtuseness to the opportunity of buying it at the grocery, is really painful. Why is it? Does he not repeatedly crave, taste, and admire the honey-comb on the table of his country cousin? Is not the opportunity to "rob" a wild swarm hailed with rapturous delight by all who do not know a drone from a worker?

It is not entirely the fear of adulteration, for the average man swallows quantities of glucose without winking (and knows it too), in the shape of "maple" syrup. Without pretending to exhaust the subject, two considerations have a bearing on this point. One is the pertinacity with which said average man surfeits himself on the rare occasions when he does eat honey. The other is the smeary nature of honey itself. Practically, the housewife and the eater should, and perhaps do, handle honey dishes, knives, and spoons without much trouble, with a little care; but that is not the point; it is the *idea*, as the woman said of the mouse. Honey, in the popular mind, is very nice, but dreadfully sticky—not that many go to the trouble to think out all this, but a prejudice may be both subtle and forcible at the same time.

One remedy for stickiness would be to have honey in the form of small confections, as clean and easy to handle as gum-drops. "But the honey taste?" There's the rub. Still, it is worth thinking about.

Honey candy is a superior article, but not exactly honey. Granulated honey deserves consideration. True, it can not be molded like confectioners' sugar; but by watching a can of honey until it is seen to be in the first stages of granulation, then pouring it into shallow pans duly greased or oiled, or lined with paraffine paper, then setting away for a few weeks, it may be cut up when hard (employing some care, so as not to split it in the wrong place) into little nuggets, providing the layers are not over  $\frac{1}{2}$  or  $\frac{3}{8}$  inch thick. These may be wrapped in twists of paraffine paper (with a soft motto inside, perhaps), and set away in a cool place until disposed of. Most grocers keep candies. Possibly a special grater or masher would put hard granulated honey in the right condition to make chocolate drops.

This is not just the thing, either. It could be done in Colorado, but I do not know whether it would work in a moist climate. Then, too, some honeys do not granulate at all, and others do not granulate in the right way for that purpose. Unless coated with a foreign substance, the product would still cause sticky fingers.

Mr. F. Raufuss suggested to me lately that a field which has never been worked is some method of rendering granulated honey perfectly dry, like what is left on the bottom-board of a hive after the bees have robbed it out. This would make an article very easy to handle and ship, and perhaps extend its uses in confectionery. It might be done before granulation is quite complete in some such way as molasses is removed from loaf sugar.

Still, granulated honey does not produce just the same effect in the mouth as liquid honey. After all, the most important requirement is to fully satisfy the popular idea of honey. A few years ago I procured a large size of gelatine

capsules, and experimented in filling them with honey. The results were not satisfactory. The gelatine produced a highly disturbing effect in the mouth by first breaking into brittle and glassy pieces, and then, after the honey was gone, dissolving with a coarse material flavor that quite obliterated the ethereal gusto of the honey. I then made some paraffine capsules by means of two sticks for molds, one a little larger than the other. These were too fragile, and left too much residue in the way of chewing-gum. I had some thoughts of attempting to make capsules of honey candy, but gave it up as too difficult on a large scale, without the proper appliances. Moreover, such a confection gives too much prominence to the candy at the expense of the honey, for the honey disappears quickly and the candy slowly. What is wanted is a comparatively tasteless envelope, disappearing quickly. I have heard that "bonbons filled with liquor" are common in Germany, so I suppose there are such things on the market, which could be adapted to our needs by substituting honey for the liquor. Can it be done cheaply enough? Only a confectioner could tell.

Very likely machinery would be needed, placing it beyond the power of the bee-keeper to manufacture. Here is a chance for those Medina machinists. Think of the combination—"The So and So Company, manufacturers of bee-supplies and honey confections," which means that the power, the machinery, the honey knowledge, the direct communication with bee-keepers, and a peculiar interest in the the product, such as other manufacturers could not have, are all in one.

The plan of dividing honey into mouthfuls, however, does not preclude a possible surfeit. The mouthfuls may be too often repeated, and then—"No, thank you; honey does not agree with me," or, "I used to think there was nothing like honey, but somehow I have lost my taste for it." Some will say this is laying too much stress on a small point. I do not know about that. It is true, honey is like a staple to some people—Mr. E. T. Abbott, for instance, who eats it 1095 times a year; but do we not all know of families on whose tables honey may be placed every meal, without being touched oftener than once a month by about half the family? I know of two or three just such families; and from remarks of my customers I suspect the existence of many similar ones. Now, it may be just a notion of mine; but I suspect that, if once a day a little dab of honey, just a taste, were placed by the plate of each person, that little dab would generally be eaten. There is no dislike to honey, as a rule; it is just indifference; and if such individual portions would generally be eaten, it needs only a little arithmetic to show that the consumption of honey would be vastly increased. Just secure the

fate of the average individual portion, and the mass of honey follows.

What are the motives which lead the average person to accept or refuse honey at the table? First, it must generally be regarded as a tidbit, or part of the dessert. To push it as a staple, I am satisfied, will lead many to reject it entirely. Its delicate aroma is best appreciated by small tastes, and is deadened by ordinary bites. Not only, to many palates, is it thus reduced to the level of ordinary food, therefore regarded with indifference, but these are generally the people on whose stomachs it "sits heavily" in large doses, creating a slight feeling of repugnance, thus sealing the fate of the next twenty-nine chances of honey consumption. Second, given this feeling of indifference as a result of too free previous indulgence, the choice between eating and not eating any food depends on the quantity in which it is offered, and the ease of obtaining it, say in the midst of an animated conversation. To particularly ask for something they do not care for is what most people will not do; and, even when presented, the sight of a great block of concentrated sweetness reminds one too vividly of the cause of his indifference. But to casually rummage around with a spoon, and unconsciously, perhaps, take a taste here and there of what is immediately before one, is the easiest thing in the world, and, at the same time, the best remedy for that indifference in the case of honey; for in this way it gets a chance to reassert its superiority by the free play which only leisurely tastes can give its elusive flavor. But the individual portions must be small, or these advantages are lost. It is not the bulk of honey eaten at one time that tells, but the frequency with which it is consumed. If at the table there are any persons who eat honey as they do molasses, they can ask for more. But these people, when they become bee-keepers, should not lay down the law for all others. I don't believe I could survive a continual diet of corn bread and bacon, even if some Southern people do grow fat on it.

[Since the above was put in type the following has come to hand.—Ed.]

I recently sent in an article, suggesting, among other things, that gelatine capsules be used for individual portions of honey. But a prominent firm of manufacturing chemists, to whom I wrote about the matter, replied: "The manufacture of empty gelatine capsules requires expensive molds and machinery, and it would not be practical for any one to make them unless in very large quantities—a million and upward." That settles that. Here is another suggestion: For little chunks of comb honey, it is possible that transparent adhesive paper (such as is used for patching leaves in books), so as to be capable of folding into a miniature *tight* carton, would be cheap and

satisfactory, and would show off the honey something as gelatine would. It would certainly be very desirable to retain the feature of transparency in the package, no matter what it was made of.

*Concluded in next issue.*

## RELATIVE MERITS OF THE WIRECLOTH AND PORTER ESCAPES.

### REQUIREMENTS OF AN OUTDOOR BEE-ESCAPE.

*By F. Greiner.*

The Porter escape has perhaps found more favor among our bee-keepers than any other form of escape, and still there are others that work very satisfactorily, and for some purposes are even better than the Porter. The latter is constructed on the spring and cone principle combined, and it is absolutely impossible for even a single bee to work back through it. This feature makes it most valuable when the escape is used on the hive between brood-chamber and full super. Our other escapes, with the exception of the trapdoor escape, which is in principle somewhat like the spring escape, except that the force of gravitation is made use of instead of the spring, are constructed on the cone and labyrinth principle; and as we increase the number of the different sets of obstructions the surer we are that no bees will work back.

If we take a look at the under side of one of these escapes while in operation on the hive we find it is completely covered all over with bees, and, of course, a few of them are right on the apex of each flattened cone, and are liable to work in. When they have entered the cone, other bees from below take their places; some may also work in, and so on until finally the first chamber inside between two cones is crowded with bees. It is apparent that, the larger or roomier this chamber is, the better; for, not until it is crowded with bees will some of them be very likely to occupy positions at the apex of the next cone, and have occasion to enter that also. After a while the second chamber will also be crowded with bees, and then a few bees will get into the full super.

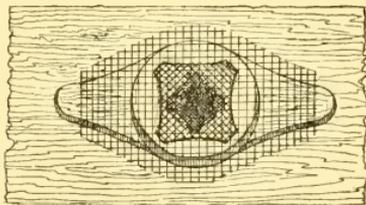

It is, perhaps, not entirely settled how many consecutive cones it is necessary to use in the construction of one of these escapes to make it work perfectly on the hive. Mr. Dibbern claims his last bee-escape, illustrated in Nov. 15th GLEANINGS, does work to perfection, and perhaps it does. It is built with three sets of obstructing cones, and has large spaces between them, the entrance and exit holes being some 10 or 12 inches apart. It does not let the light in, and is for that season best adapted for use on the hive and not so well on a stack of supers. I have made up a few of these "Rapid" escapes, and shall give them a trial next season.

A few years ago I received, through Mr.

Dibbern's kindness, an escape in principle somewhat like his "Rapid," but reduced in size to 5x7 inches. It was constructed in such a manner as to make it necessary for the bees to pass six sets of obstructions. It was indeed a labyrinth, and I don't believe a bee has ever found its way back through it. It has stood the test of several years perfectly, and I consider it in every way the equal to the Porter except in cost, and perhaps the same may be true of his "Rapid" escape, which, it will seem, is too expensive, taking more material in its construction, and requiring more time to make up.

Dibbern's four-point escape has served a good purpose, and I consider it to this day the best for use on a stack of piled-up supers; and if made roomy enough—that is, with enough space between the different cones, it can not be excelled for that purpose.

According to my idea, the requirements of an escape to be used out of doors on a stack are: 1. It must let the direct light fall in to attract the bees; 2. Its exits should be some distance from this place, admitting the light, say, at least three or four inches. As the four-point Dibbern has a diameter of only three inches, its exits are only a little over one inch from the center hole; and when the bees from a stack of piled-up supers begin to escape, robber bees collect and try to gain admittance. The scent arising from the honey within is strongest right over this hole, and robber-bees pitch for it in a lively fashion, and soon cover the whole three-inch escape in a way to nearly prevent the bees from within escaping, some robbers even gaining entrance at the points. Now, if the exits were located some four inches distant from the center hole, there would be little or no trouble. The bees could then constantly escape, as the exits would be unobstructed.

As soon as this became apparent to me I thought of adding to the four-point Dibbern, which is a double-cone escape, another cone, locating the exits sufficiently far from the center to obviate the trouble spoken of.

The regular D. escape occupies only a bee-space in depth, and requires only a  $\frac{3}{8}$ -inch board (with a bee space on one side). Instead, I have taken a  $\frac{1}{4}$ -inch board, cut a 4-inch circular hole in center, for the four-point escape, and then with chisel, etc., I cut away half the

thickness of the board in a double cone shape, as shown in the drawing. Over this I tacked wire screen, making the exits eight or more inches apart.

The now three-cone escape is all inside of the  $\frac{3}{4}$ -inch board, and is well protected against all injury. I have used such escapes ever since the escape has come into use, and they are just as good to-day as ever. I like the Porter spring escape for use on the hive, but would not want to be without my thus arranged four-point Dibberns.

I now want to speak of some difficulties arising from and connected with the use of bee-escapes, and I greatly desire that wiser men would give us a remedy for which, I am sure, we all should be very thankful.

When escapes are used on a pile of stacked supers, it will be noticed that the bees inside pass out the honey to the robber bees outside, especially if no bee-space separates them; but even in an escape like the one illustrated, the same thing occurs. Indeed, even bees that have come out of the escape are often followed up by robbers, and harassed until they give up the sweet they are loaded with. Sometimes half a dozen bees can be seen at once, being fed by one loaded bee. This keeps up the excitement, and it is for this reason always best to wait until the bees have ceased to fly before carrying the honey to the house.

When escapes are used on the hive, another and much more serious trouble occurs. I refer to the capping being gnawed or perforated, principally of the central portion of the section of the super next to the escape. It does not occur in every instance, and much more so after the honey season has closed; it injures the looks of the honey very materially. I should be glad if I understood this matter. Who can tell us why bees act so in one case and not in another?

Naples, N. Y., Dec. 15.

### PROTECTION FROM ADULTERATORS OF HONEY.

A VALUABLE AND SENSIBLE SUGGESTION.

By *Wm. G. Hewes.*

I would suggest, as one means of protecting ourselves from the adulterators of honey, that we make an effort to have Congress place an internal-revenue duty on glucose of two or three cents a pound. The coming Congress will have to take steps for increasing the revenue, and it is not unlikely that, if the matter is brought to their attention, they will acquiesce in our wishes—especially if we are backed up by the producers of cane, beet, and maple sugar, all of whom suffer by having their syrups adulterated. As to the extent to which sweets are adulterated with glucose, we have but to

refer Congress to the government chemists. Glucose, I believe, is valueless as food; is of no value in the arts, and is manufactured for swindling purposes only.

There are but few apiaries in this locality which do not have to be fed this season. Two of mine are among the lucky few, and one I have to feed. I see in the Nov. 15th GLEANINGS that Doolittle says feeding is not to his liking. Until I read that I always thought that feeding bees was an eastern bee-man's idea of supreme enjoyment, seeing how often it is recommended by them to extract all the honey and then feed sugar.

I have various kinds of feeders, but find nothing better than a lard-bucket or other vessel with a few bits of comb floating on the syrup. Wooden feeders are apt to be leaky; and with the Miller feeder, unless it fits the super very snugly, many bees will be drowned. The "division-board" feeder, described in Doolittle's "Queen-rearing," is excellent; but instead of making it the width of a frame I make it three inches wide, and have floats in it.

I have also practiced elevating the front of the hive, and pouring in syrup at the entrance; but that was the most unsatisfactory of all methods, as so many of my hives leaked.

I have been painting the cracks in some leaky hive-covers with asphaltum, and think it a rather good idea where the hives are kept shaded, but not otherwise, for the heat of the sun would cause it to melt and run through on to the combs. Probably if it could be whitened it would not melt; but paint does not seem to stick to it, for some I gave two coats to is still a magnificent jet.

I should like to see how Mr. Frazier figures out a profit on ten-cent corn. Seventy-five bushels an acre is only \$7.50. No great profit, even if it were clear gain. Take from that the cost of growing, harvesting, shelling, and sacking, and I can not figure out profit enough to pay taxes. Some people are so peculiar that, if the leaders of their political party tell them they are prosperous, they will promptly accept it as a fact, and proceed to take on fat.

The prospects for prosperity among California bee-keepers are not very brilliant. With half the bees in the country dead, and no honey gathered now for eighteen months, one would think the price would be good; but it is only four cents for best, and not ready sale at that.

Speaking of prosperity, the *American Agriculturist*, in its Western edition, after telling us what prosperous fellows the farmers of New York are, makes the precious statement that the trouble with the West is that the people are lazy, and have not banks enough!

Newhall, Cal.

[Your suggestion along the lines of throttling the glucose evil is the most practical one I have seen yet. Here is a chance for work for the new Bee-keepers' Union. If it is a fact that

glucose is valueless as a food, and is of no use in the arts, and is manufactured only for the purposes of swindling, then I can not see why bee keepers, in connection with the producers of cane, beet, and maple sugar, can not, through their Members of Congress, some time in the future, have an internal-revenue duty placed on glucose at so high a rate that it can not be used for adulterating. We may do well to ponder this suggestion.—ED.]

### SECTION SUPER WITH PATTERN-SLATS.

THUMB-SCREWS VS. WEDGES FOR PRODUCING SIDE COMPRESSION.

*By C. Davenport.*

Some time ago in GLEANINGS I described a super that I prefer, which is a case just long enough to take in four rows of sections, and deep enough to take in the section and pattern-slats, and yet allow a bee-space. These pattern-slats have no end-pieces, and in your foot-notes you say that, without end-pieces, the pattern-slats are liable to get skewed, and then the openings in some cases will not come together in exact alignment, which makes them, "the openings," very much narrower.

I do not believe you understood what I meant; for with scalloped pattern-slats the separators drop down between them; or even without separators the follower and wedge will hold them in place, so that it is impossible for me to see how the openings can get out of exact alignment.

After a more extended trial of these supers the past season I prefer them to any others. They are superior to those having end-pieces on the pattern-slats in every respect, so far as I can see. Those thumb-screws which you advertised last year for the first time are decidedly better in every way, in my opinion, than a wedge is for tightening sections in the supers. I thought, when I first saw them described, they would be a good thing; and after using 30 supers that had them, the past season, I find they work even better than I expected them to. In producing section honey I regard it as very important that the sections be wedged up very tight sidewise; for if they are not, in this locality at least, the edges of the sections will be very badly stuck up with propolis, and the edges are the hardest part to clean; besides, propolis from the edges will often, when it is being removed, get into the cells of unsealed honey next to the edge. This injures the appearance of the honey, and does not improve its flavor, to say the least.

With one simple wedge it is impossible to tighten the sections much. I use two wedges for each super, and drive them quite tight with a hammer; but this is considerable work, and they are hard to remove when badly stuck up with bee-glue. Thumb-screws are better, and always right in place when wanted. When

I got mine I put them into a keg of linseed oil to soak. This greatly injured them. It caused the threads to check and crumble off somewhat. I have since learned that, if I had put them into hot tallow instead of oil, it would have been a good thing for them.

### TALL SECTIONS.

I notice that you seem to be in favor of changing the standard of size in sections for one tall and narrower. It would cost a good many—at least it would cost me—a good deal of money to change or fit all my supers for another size of section; and at the present low price of honey for even the very finest grades, I think it would be a good while indeed before I could get enough more from the sale of honey in tall sections than I would from that in standard-sized ones to pay me for making the change. But will honey in tall narrow sections sell more readily? Last fall I was in St. Paul and Minneapolis, where I sold about 2000 lbs. of honey in standard-sized sections. One day in Minneapolis I was in a large retail store, where I sold a large amount. They had some tall narrow sections that held about a pound. A man came in and wanted a few pounds. He was offered some in these tall sections. He refused them, and said there was too much comb and too little honey in them to suit him, and that he wanted no more of them. He took some in square sections which I had just sold them, and said there was more real honey in one of them than there was in two of the others. Of course, his was an extreme view of the case; but will the general public be fooled into believing that there is more honey in tall thin sections than there is in others of the same weight that are square and wider?

A person who seldom buys honey, or one buying a section for the first time, might do so; but regular buyers or users would not long think so.

Tall sections filled would, I believe, be much harder to handle without injury. It would require more foundation to fill them, and on this account they would be more apt to have fish-bone in the honey. It is claimed that bees will fill and cap these tall thin sections quicker than they will square ones. I have never used them, but I have strong doubts of this. If a swarm is hived in a shallow brood-nest containing less space than the regular eight-frame hive they may enter the supers sooner, and do more section work in any kind of sections during a short flow; but in that case the colony will be, and can not help being, "if there is only one flow," short in stores and bees for winter. On the other hand, if the flow is long they will not do as much section work; for, not having enough brood room, they decrease in strength before the flow is over. I am now speaking from much experience in this matter; and while shallow or double brood-chamber

hives, especially in localities where there is a fall flow of honey that will answer for winter stores, can be very profitably used under the right management. I do not believe tall sections have much to do toward their success. If grocers want sections of lighter weight than  $1\frac{1}{2}$  wide gives, narrower ones can be used. Supers will not then have to be changed, and we shall preserve the standard square; but I believe it would be folly for us to try to suit grocers and dealers in all respects, for some of them would always want some changes made, which might be a large expense to the producers; and at the present prices of our product we (or at least many of us) are not able to stand any unnecessary expense.

Southern Minn., Jan. 2.

[If the wide separators run clear down between the patent-slats, then the objection that I urged would not hold. Such an arrangement would be perfectly practicable. Thumb-screws may be a little better for producing compression. The advantage of the wedge is that it is inside of the hive, and out of the way, while the thumb-screws stick out beyond the sides of the super.—Ed.]

#### SQUARE VERSUS OBLONG SECTIONS.

COMBS NOT ATTACHED TO THE SEPARATORS.

By G. C. Greiner.

[Ever since the one-piece sections have come into general use I have had an opportunity to make observations in regard to their practicability. The usual  $4\frac{1}{4} \times 4\frac{1}{4}$ -inch section did not fit the hive I used. To accommodate my surplus-appliances, a section  $4\frac{1}{2} \times 5 \times 1\frac{1}{4}$  inches was necessary and desirable. First, it held as nearly a pound as sections can average; and, second, I greatly preferred the oblong shape. After these many years of practical experience the result is so different from Mr. Salisbury's experience, as set forth on page 17, that I am of the opinion the objections raised by that gentleman are in a great measure imaginary—not that I have the least doubt as to the correctness of his statement in regard to combs being fastened to the separators, but that there is another factor at the bottom of his trouble besides the oblong shape of his sections.

The difference between the width and height of the  $4\frac{1}{4}$ -in. square and his nearly  $4 \times 5$  in. sections is so trivial that it seems almost impossible that bees would attach the one and not the other. Nature directs bees to build their combs plumb; and, guided by this impulse, they do their work in a way that will accomplish this object. In examining sections in their various stages of progress we invariably find them on both sides alike, drawn out and filled, or so nearly alike that a swinging one way or the other, by greater weight on one side, could not be caused. The only difference we always notice is in capping. The outside combs are on

the outside, more or less behind the inside; but the weight of the cappings is of little amount that, by this slight variation of weight, a comb would not be forced out of its perpendicular sufficiently to strike the separator and be attached.

As I have never used the  $4\frac{1}{2} \times 4\frac{1}{4}$ -in. section I can not say how much better my bees would have done along this line of not attaching to the separators; but I can say that, in all of my experience in producing honey in oblong shape, I have not had enough sections made unmerchantable, by being attached, to fill a 24-lb. shipping-crate.

#### BUCKWHEAT SEASON.

The past summer can be recorded as one of the occasional exceptions—a season without buckwheat honey. When the buckwheat had reached its honey-producing stage, bees started in in good earnest, and bid fair to gather an abundant crop; but after a few days' work the cold wave struck us and blasted our hopes. Most of the time it was so cold that bees did not leave their hives, even in the middle of the day; and when warmer weather returned, buckwheat was so near its close that bees did not resume work in sections; consequently many unfinished sections were left on the hives. I have about 1000 drawn-out sections, many of them full-sized, perfect combs, all cleaned out by the bees, and stored away for next season. What seemed to be a loss last fall may prove a blessing in disguise in the shape of an increased honey crop next year.

Naples, N. Y.

TALL SECTIONS PREFERRED; NO TROUBLE WITH COMB BUILT TO SEPARATORS.

In GLEANINGS for Jan. 1, p. 17, Mr. F. A. Salisbury seems to have trouble by getting comb fastened to separators by the bees in drawing out the foundation. I have been using both the square and oblong section, and I find no more tall sections fastened to separators than square ones. I have used the Danzenbaker section,  $3\frac{3}{4} \times 5 \times 1\frac{3}{4}$ , for two seasons, and I prefer them for more reasons than one. First, there is a better market for them, and that is one of the best reasons, as I make it to sell; and, again, I think the bees will enter a deep super sooner than a shallow. I think if Mr. Salisbury will use  $1\frac{1}{2}$ -inch starters in his sections, put them in with a Daisy foundation-fastener and set his hives level, he will have no trouble with his tall sections.

S. D. MATTHEWS.

Hamilton, N. C., Jan. 12.

TALL SECTIONS BEST; NO TROUBLE FROM COMB BEING BUILT TO SEPARATORS.

In GLEANINGS for Jan. 1, Mr. F. A. Salisbury raises an objection to tall sections because the bees fasten the comb to the separators more than they do in the  $4\frac{1}{2} \times 4\frac{1}{4}$  sections. I have been using a section  $4 \times 5$  for a number of years, alongside the  $4\frac{1}{4}$  section, and I have not discov-

ered any perceptible difference in regard to the bees fastening the comb to the separator of the tall section more than to the  $4\frac{1}{4}$  section. I am like Mr. Doolittle—I think they are more symmetrical in appearance; and I have found that, where the two sections have been brought into competition with each other, the tall section sells first. In our market here I do not know that they bring any more; but I know that the tall section is the more easily disposed of; and the fact that more of them will stand over a given space is a point in their favor.

Delhi, Ill., Jan. 23. H. D. EDWARDS.

#### MR. DANZENBAKER N THE TALL SECTION.

My attention has been called to Mr. Salisbury's objection to tall sections on page 17 in GLEANINGS. The veteran Doolittle, who is always right, has more than answered him in the next column. I take exceptions to his idea that it is the bees that twist his foundation out of line. I had a like trouble with some  $1\frac{3}{8}$ -in. sections that would not stay square. They would spring or draw out of square, and bind the foundation and cause it to wind out of line. I overcame that entirely by seeing that the sections were folded true, and kept so by wedging them in the super before and after the foundation was put in. I also set the foundation so that, if the section was out of plumb, it would not press against the foundation when the section was squared up.

Washington, D. C. F. DANZENBAKER.

#### TALL SECTIONS NO ADVANTAGE OVER THE SQUARE.

Referring to tall sections I will say that for ten years I used a section  $5\frac{1}{4}$  high and  $3\frac{1}{2} \times 1\frac{1}{8}$ , which holds about the same as the  $4\frac{1}{2} \times 1\frac{1}{8}$ ; but they cost me from 50 cts. to \$1.00 more per 1000, and had to be made to order. I was sometimes troubled to get them in time, so I am now using the  $4\frac{1}{4}$  section. I don't think my honey in the tall sections sold for a larger price than honey in square sections; at any rate, I never got a large price for it, and commission men who have sold it never told me it sold quicker. I was not troubled much by having foundation fastened to separators if hives were kept level.

W. J. AUSTIN.

Chittenango, N. Y., Jan. 12, 1897.

#### IN FAVOR OF THE TALL SECTION; A PRACTICAL SCHEME FOR USING THEM IN THE REGULAR DOVETAILED SUPER.

I see in a footnote you want opinions as to what kind of sections bee-keepers would rather use. I for one would rather use a tall section that would weigh just 1 lb. as nearly as possible, and I have thought of a way in which the tall section might be used on the eight-frame hive; but I have not tried it, and it might not work as well as I think. My arrangement is something like this: Instead of there being a rim on top of the super, have the rim on the

bottom (not nailed fast); then to this rim nail the bottom-bars of the section-holders, the bottom-bars to be an inch longer than they are now; a groove cut out of the rim on the bottom side to admit the bottom-bars, and have them nailed fast to rim; then use two followers and wedges the size the section ought to be. I haven't figured out, but it ought to be so as to give more elbow-room in the super. The two wedges ought to be square pieces at least  $\frac{3}{4}$  of an inch square. This would give a chance to take a section out as soon as finished before it is travel-stained.

WM. KERNAN.

Ringdale, Pa., Jan. 7.

[Your scheme is perfectly practicable, and we can adapt supers in that way if so desired. Later on we may show a cut of the plan. As the standard tall sections are 4x5 inches they can be used crosswise of the regular 8-frame super (which is  $12\frac{1}{4}$  in. wide) without any waste space to fill up. Of course, the hive should be perfectly level in that case.

It would seem from the letters above, that there is no very great danger from combs sticking to the separators. I doubt not that there will be many who will want to try a few of these tall sections on their dovetailed hives, and yet feel that they can not afford to buy new supers. To accommodate all such we have arranged to supply a rim deep enough and large enough, when put on the bottom of a regular 8-frame section-super, to take in 4x5 sections with supporting-slats.—ED.]

#### PRODUCTION OF COMB HONEY.

By *Adrian Getaz.*

This article is written exclusively from a comb-honey producer's standpoint; and if some of the assertions made seem exclusive, it must be remembered that they apply only to the conditions peculiar to comb-honey producing. If there were no swarming, the management would be the simplest thing in the world. Just put on enough sections at the right time, and take them away when they are full. That would be all. But with the swarming, the difficulty begins; so, after all, the comb honey-producing question resolves itself practically into a swarming-management question.

#### NORTHERN MANAGEMENT.

What I mean by this is the management adopted and advised by all or nearly all our leading writers, and suited to what I may call the Northern States, including Canada, the Eastern States, and the Central Northern States, such as Ohio, Illinois, etc. The characteristics of the honey-flow of that region are: A moderate flow from the winter until the main honey-flow, just enough to get the colonies in good shape; then follows a heavy flow of only a few weeks' duration, the swarming taking place just at the beginning of it.

Two methods of management have been successfully practiced under these circumstances. The first consists in hiving the swarm on the

old stand, and having as many as possible of the bees there; and, by contracting the brood-nest, compel the bees to store most of the honey in the sections. The second consists in removing or caging the queens at the beginning of the main flow, and not returning them until three weeks later. The queen-cells raised during that time are to be destroyed.

#### SOUTHERN HONEY FLOW.

There is a fundamental difference between the northern and the southern region as to the character of the honey-flow. In the northern region, as described above, the swarming is followed by only a few weeks (six weeks at most) of comparatively heavy flow. Here, and in all the South, we have, after the swarming, a period of from two to three or even four months of moderate and very irregular flow; that is, not a continuous flow; and what makes it more difficult is that we can not tell in advance which sources of honey are going to yield and which ones will not; so it is necessary to keep the colonies as strong as possible during the whole period. This necessitates prevention of swarming, or, at least, of increase, and also the least loss of brood possible.

And what I say here of the South applies more or less to the Northwestern States where the surplus comes from alfalfa and sweet clover, and to the Pacific Coast.

#### TWO PRACTICAL CONDITIONS.

Many processes of preventing swarming have been successfully practiced, but yet can not be advised under the circumstances now considered. The first condition is, as already stated, the least possible loss of brood. The second is the least possible work for the apiarist. This throws aside all the processes requiring to do certain things when the colonies are in a certain condition; for instance, when they are beginning to build queen-cells. The reason is obvious. To know when a colony has reached the proper point would require at least two inspections every week. Think of the work in an apiary of 300 colonies, besides the aggregated loss of brood and honey caused by the disturbance! What is to be done must be done in a wholesale way, at a definite time, say, for instance, at a certain time of the year, or when the swarming takes place.

After some seven or eight years of experimentation with all sorts of methods and apparatus, I recommend the two following processes.

#### FIRST PROCESS.

Discourage swarming by all possible means. Have the brood-nest of sufficient size; put on the supers in due time; use all the drawn comb you can; don't keep any queen over two years old, etc.

A point here needs insisting upon. The first super ought to be given early enough to prevent crowding in the brood-nest. On the other

hand, the excess of room given tends to lower the temperature of the hive and frequently prevents the working of the bees in the super—at least the building of comb, especially during the night. A good deal has been written concerning the necessity of protecting the brood during the early spring, but nothing or next to nothing concerning the necessity of keeping the first sections given sufficiently warm, during the first part of the season. Yet I consider the last point as important as the first; and I do not hesitate to say that, in most cases, when the bees do not enter the supers readily, it is because they are unable to keep them warm enough to work these successfully. Notwithstanding, a certain number of colonies will swarm. Return the swarm and remove the old queen at once. Take out all the queen-cells but one, and allow the colony to requeen. This does not cost any thing; the cells are there, the young queen is, as a rule, preferable to the old one, and the time without a laying queen is reduced to a minimum. A queen caged or removed can not be returned before 15 or 20 days or she would swarm again; and even then a certain number would reswarm. Raising queens in advance would necessitate the making of nuclei, and the draft of bees and brood from the colonies to make the nuclei would damage them more than the loss of brood by the above process. Use the removed cells to replace as many of the oldest queens possible, or those otherwise objectionable, thus reducing the number of colonies liable to swarm. It is needless to say that the use of queen-traps will reduce the above work to a minimum.

#### SECOND PROCESS.

Where bee-paralysis exists I prefer to requeen the apiary throughout, though I have not always had the time to do it. Requeening in the very early spring is objectionable. In the first place it is not absolutely certain that it would prevent swarming in all cases. Buying queens in Florida costs something. Raising queens very early entails a considerable loss of brood and bees to the colonies, and one bee at that time of the year is worth ten in the middle of the summer. The raising of queens by the nucleus process takes too much work anyhow when one wants only queens for his own use. I prefer to wait until the time, or near the time, of swarming. If a few colonies swarm before I am ready I treat them as stated in the preceding paragraph. To reduce the loss of brood to a minimum I unqueen at first only one colony out of six or seven, perhaps eight, and I use their cells to requeen the others, removing the queens only when putting in the cells. I wait as long as possible to do the final requeening, partly to reduce the loss of brood, partly because the cells not well advanced are not always accepted. It seems that

an immature cell is to the bees nothing but a lump of strange wax, which they proceed to tear down, while an advanced one has already the scent of a queen, and is accepted as such.

Some precaution is to be taken in putting them in. Sometimes the bees spoil them in trying to fasten them to the combs. Perhaps the best would be to use some kind of cell-protectors. To facilitate the operations, entrance-guards ought to be used so as to prevent the loss of a swarm in case some queens happened to emerge before the time anticipated. It is well to see that queen-cells be not started between the time the cell is put in until the young queen emerges, or, rather, to destroy them. None will be begun after she is out, or, at least, very seldom.

#### INFLUENCE OF BEE-PARALYSIS.

As I have often stated, bee-paralysis exists here, and is a serious drawback to the apiarist. The malady damages in several ways. First, by reason of less activity in the bees, which, as the malady advances, become more and more paralyzed; secondly, shortening of their life; and, thirdly, a failure in the laying powers of the queens. This takes place during the second year of their life, or even sooner. In such cases they are generally superseded; and with the superseding, swarming takes place. The result is a great excess of swarming besides some loss of brood during that time as a result of the failure of the queen. Very often queens disappear entirely without any apparent cause.

Occasionally the bees fail to requeen, either because the colony is too small or because the sick bees lack the necessary activity. In that time, and under such circumstances, the colony enter into what some writers have called the second stage of the disease. One of its characteristics is that very young bees, even just emerged, show already the symptoms of the disease.

The only way I can account for it is that, when the queen has reached that degree of sickness, her eggs contain already the germs of the disease. This supposition is not improbable. The disease of the silkworm is produced by a bacillus almost identical to the one producing bee-paralysis; and in the silkworm the disease is transmitted from one generation to the next, through the eggs of the female moth.

Any careful reader of the bee-papers may have noticed that, while our leading writers do not think that bee-paralysis is such a terrible thing, reports come now and then from honey-producers of disastrous results. This corroborates the above supposition. Most of our leading writers are queen-breeders, and renew their queens all the time, which results in vigorous and healthy queens, or, rather, queens that may barely have the germ of the disease,

while the honey-producers leave the requeening to the care of the bees, resulting in queens reaching the age of two or three years, occasionally more. My own experience is the same. By frequent requeenings, I find that I can keep the disease within comparatively narrow limits, but not cure it completely, showing that other ways of contamination exist also.

#### CONSTRUCTION OF QUEEN-CELLS.

From ages past until now it has been admitted that, when the bees were too crowded, they decided to swarm, and constructed queen-cells to save the old colony from being left queenless. That last part of the program is a mere supposition. I doubt whether the swarming bees care a snap what becomes of the old colony.

Some four years ago I acquired, during my experiments, an entirely different opinion on the subject—an opinion that the following years have fully confirmed. The construction of queen-cells is due to an excess of larval food. It takes place when three conditions exist: 1. A honey flow which furnishes the materials; 2. A considerable number of young bees acting as nurses, and preparing the food; 3. A diminution of the brood to be fed, that is, not enough to consume all the food prepared.

The diminution of brood to be fed may be caused either by the lack of empty comb to receive the eggs or by the failure of the queen to lay enough. A young vigorous queen will lay all the eggs (if she has room enough) that her colony can take care of. That is the reason why, unless decidedly cramped for space, a queen of the year's rearing will seldom swarm, or, to put it properly, her colony will not often construct queen-cells.

#### CONFLICT BETWEEN QUEEN AND QUEEN-CELLS.

By the time the queen-cells are sealed, or soon after the old queen realizes (probably because the sealed queens begin to have the queen's peculiar odor) that she has rivals, she attempts to destroy them; but the bees instinctively prevent her from doing so. The excitement keeps growing worse and worse, and finally culminates in swarming. If two or more queens are in her presence a fight ensues, and only one is left; but when one queen can not destroy those contained in the queen-cells, she is sure to swarm, or, rather, the racket she raises induces swarming, and the whole outfit goes out together. A caged queen placed in a colony has the same effect as a queen-cell, as I found out by an involuntary experience myself. Some German writer has advised that very process in order to compel a colony to swarm.

If the cells are where the queen can not be aware of their presence, in an upper story, for instance, no swarming will take place, showing conclusively that the jealousy of the queen against the cells is the cause of the swarming.

Knoxville, Tenn.

#### HOW TO BUILD UP A REPUTATION.

*Question.*—Is it any advantage to put your name and address on cases of honey which are to be shipped on commission to commission men? If so, what?

*Answer.*—Each year, from 1871 to 1877, I sold my honey to a dealer in Syracuse, N. Y., delivering it there by wagon, so that it always arrived in first-class condition. As the merchant always took all the honey I had, both extracted and comb, together with all the dark honey, I considered it a good thing for me, and would still think so if I could thus sell my honey now; but death removed him in the early part of '78; and although I have several times tried to have other parties in this city take his place, yet not one was willing to do so, as regards buying and selling honey. However, there was one thing I did not quite like, which was that he insisted on my bringing the honey to him in cases having nothing on them except the gross weight, the tare, or weight of the crate, and the net weight of the honey. When I asked him the reason for this he showed me stencil-plates bearing his own name and address, and said, "I put my name and address on every case of *really fine* honey which I buy, so as to build up a trade in honey, thus securing a name second to none; for with all inferior honey I leave this stencil-mark off, so that none but the very best bears my name, and thus I am gaining a reputation year by year which is growing constantly to my benefit. If I allowed you to put your name on the cases it would not help me a bit; and as long as you sell to me each year it could be of no benefit to you." After a year or two I saw that his line of reasoning was correct; for every year gave him a larger range of customers, until, at the time of his death, he handled honey by tons to where he handled it by the ten pounds when he began. After his death I began shipping honey on commission, and wrote my commission merchants, asking them if they would allow me to put my name and address on each case. To this they objected; but a few said they had no objection to my putting my name on the sections inside the case if I wished to do so. I accordingly procured a rubber stamp with the words "From G. M. Doolittle, Borodino, N. Y.," on it, as well as a dating-apparatus which would remain good for ten years. I could now, in a moment, put my name and address on any thing I wished, from a postal card up to a bee-hive, and give the date of so putting on, if desired. Outside of the first object, as originally intended, I have found this stamp of great benefit to me in many ways, and I would advise everybody who reads this to procure such a stamp and see how much in time, money,

and temper it will save them. I believe The A. I. Root Co. can furnish such stamps to any who may desire. To return:

Taking the hint given me by the honey-merchant, I put my name on only all really nice honey, and let all "off grades" go without it. And right here I wish to throw in a suggestion. We have heard much in the past from commission men and others about some sending them honey, putting all sorts of inferior honey into the same case with fancy honey, putting the fancy on the outside, and the inferior in the middle of the case where it would not be seen till the case should be opened. I never blamed commission men for being out of patience with those who would work against the interests of every one concerned, enough to do this thing; and the suggestion I would make is this: If you will procure a rubber stamp, and use it as did the honey-merchant spoken of above, no one will ever have a chance to say aught but words of praise for the even appearance of all honey which you put in any case. To return again: □

After the sections were all in the shipping-case, and before the cover was put on, it took only a moment or two of time to stamp all the sections in that case, thus letting the consumer know by whom such fine honey was produced, while the commission merchant received all the credit with the retailer, unless, perchance, such retailer desired to deal direct with the producer. And thus it came about that I got many letters from different parts of the country reading something like this: "I purchased of Mr. So and So a splendid article of honey bearing your address. As it gives the best of satisfaction, for how much could you send me—cases of such honey?" And so it has often come about, that, after my honey was all disposed of, I would have many calls for honey which I could not supply, but which gave me a "leverage" for the next year. So it will be seen that the plan of a shrewd merchant has not been lost, even if he did keep me where he wished while he was living. Why I said in the fore part of this article that I should be glad to sell as I formerly did was that there is an advantage in selling the whole crop to one person, for cash on delivery, not gotten by selling the crop out in small lots, or by shipping it on commission. All will think of some of these advantages, without my enumerating them. However, it so happens that the most of the large producers can not sell to one party each year, and for this reason I give the above plan, as I believe it to be a good one, and just the one to work upon when we can not sell our whole crop to one person, or all of it in our home market. And by this plan many are induced to eat honey who do not generally buy by the advertising done by those who are pleased by a really nice article of honey. It takes all of these little kinks as going toward a whole to make successful bee culture.

See! Do you wonder now how our valley is protected?

**N**OW, my friend," said Dr. Hayden, as they stepped from the cabin door. "as we proceed you are at liberty to ask any questions about this little valley that the surroundings may suggest."

"Well, doctor, you know the old adage, 'Give a Yankee the conversational pump-handle, and he will pump you dry;' and if my seeking for knowledge depends upon my questioning ability, then I will commence by asking you, what is the length and breadth of this valley?"

"A very proper question," said the doctor, "and a very natural one from a bee-keeper who is looking for a profitable location. This valley is two miles in length, with an average width of half a mile."

"And you have an apiary here, and propose to largely increase. Now, don't you find one square mile too little space for profitable bee culture, or do the bees find pasturage on the mountains beyond?"

"There is no flora on the summits beyond. This one square mile contains flora enough for a very large apiary."

"Why, doctor, if you can succeed with so many bees in such small area you are indeed progressive. The best locations I ever knew were considered crowded had they twenty to the square mile, and even then only one season in five would produce a full honey crop."

"That is so, Fred, where the producer depends wholly upon natural pasturage; but living as I am in this valley, with the unlimited privilege to do as I please with my surroundings, I have planted only such vegetation as will produce honey in the greatest abundance, and the results are astonishing. Now, instead of figuring how many colonies a square mile will sustain profitably I figure from the other end of the problem, and am trying to find out how many square feet will sustain a colony."

"I can readily understand," said Fred, "that a constant succession of honey flora, nearly all the year round, would give an immense amount

of honey; but as far as I have learned, there are always some offsets. The soil and conditions are not right for honey secretion sometimes, and then the atmospheric conditions sometimes fail; so, between the conditions above and below, our hopes are often blasted."

"Those things can hardly happen in this valley," replied the doctor, "and do happen only in localities where the producer depends upon only one or two sources of supply, through limited periods and under fluctuating climatic conditions."

"But, doctor, although you live in a valley in these remote mountains you are surely subject to changes."

"Yes, we are subject to changes, but we have the means to counteract them to a certain extent, as I will show you as we make the rounds of the valley."

This conversation was interrupted by the appearance of Sam, with a couple of donkeys saddled for the trip.

"Why, doctor, I had about as lief walk, as to ride one of these little ellows. I could almost carry this one on my back. By the way, is this all of the horse kind you have in the valley?"

"Oh, no! we have a young team, but it takes some time to grow a team here; the passage through which we enter the valley will barely let in those donkeys; and if we want horses we must bring them in as colts and let them grow. Just the same with our few Jerseys. They came in as calves; and if they go out it is by the quarter."

"And the rattlesnake chamber?" queried Fred.

"We have an easy way to manage that," replied the doctor, "and will show you some time. Now, the first stage in our journey will be to follow up these terraces. Hey, Sam!" shouted the doctor, "take down a little lunch about noon to the apiary."

"Ki, yi, doctor! I'll be dar under de yoak, dis side de yapery. Don't ketch me gettin' my woolly head near dem bees, suah."

Up the first terrace Fred stopped his donkey, and said, "What a profusion of little flowers are spangled over this mosslike vine that is clinging to these rocks! and how busy the bees are upon them!"

"Yes, that is one of our valuable honey-plants. Out in the great world you find that

only in flower-pots, or to make mosslike banks in public parks. It is *mesembryanthemum*, and produces an abundance of fine-flavored white honey. I am getting it well started here; you can see the possibilities for the plant in this valley. Give it a good rooting-place, and it will hang over these rocky surfaces; and the beauty of it is, that it covers the portion of the valley that stands up edgewise. This," said the doctor, as they mounted another terrace, "is my shrubbery terrace, such as veronica, heliotrope, etc. These shrubs bloom almost continually in this valley; and, see how industriously the bees work upon them. Then in the lower part of the valley I have the sugargums in their variety. Yonder is a terrace devoted to the sages, while on the level portions I have alfalfa and other plants. If we sow merely low-growing plants we can not go beyond our ground acreage; but he who plants a tree puts the acreage in the air; and with the growth of the tree the acreage is permanently increased every year."

"I have often thought of that," said Fred, "while watching year by year the growth of our basswood trees in the East; what an immense acreage of bloom was carried high in the air! But the average bee-man is looking to immediate returns, and thinks it a waste of time to plant for the future; but the fact remains that the noble tree makes the permanent pasturage."

"Yes, Fred, and I am thoroughly of the belief that, if people were dependent upon the beehive for their sweets, the production of honey would have been enlarged; the growing and development of honey-producing flora would have been pursued upon scientific principles until production would keep pace with the demand. But cane sugar relegated honey and the prospective development to the background."

"Well, doctor, that is something I had scarcely thought of; still, such development of honey flora may be possible. You said a moment ago that you now study honey production from square feet instead of square miles. Have your experiments in that line led you to determine the number of square feet that would sustain profitably one colony of bees?"

"Approximately I have proved near enough to satisfy myself; and, to speak in round numbers, one colony could find support and give a good surplus of, say, 300 lbs. on 1000 square feet of territory, or ten colonies to the acre; or 5000, say, to the square mile."

"Let's see," said Fred. "A thousand square feet would be about four square rods. Whew! that statement would sound Quixotic to every bee-keeper in Christendom. This valley must be more wonderful than any thing of which bee-men have ever dreamed. Just imagine 5000 colonies of bees in this little valley!"

"I know," said the doctor, "that this valley can be made to produce more than any other place, and it will take several years to get this up to its best; but it must be evident to you that any favorable location under an intelligent planting of trees, shrubs, vines, and plants, could, in a series of years, be brought up to a high state of production."

"Doctor, I must acknowledge that to be a fact. Why! bee-keepers, as a rule, have scarcely ever tried to increase their pasturage beyond what nature gives them; and the honey-flora of the world has not been one hundredth part exploited."

"Furthermore," said the doctor, "instead of hunting new races of bees I would hunt honey-producing flora and adapt it to our country. There is a world of study and experiment awaiting somebody in this field."

They had now reached the upper terrace, and beyond it there was a natural formation that attracted Fred's attention, and he halted his burro, and exclaimed, "Why, doctor, what a terrible-looking place that is! it looks like an acre of glass butcher knives and cleavers, all points and edges up. Why! a man couldn't walk in there five feet without cutting his feet all to pieces; and if he should fall down he'd be a dead man, sure. Ugh!" said Fred, with a shudder.

"Certainly, Fred, that is a bad piece of nature; and now while I think of it I'll show you some more like it;" and, alighting from their burros, they climbed a niche in the side of the cliff, and at the top they stood upon a little cleared place.

"Now what do you see?" asked the doctor, turning to Fred.

"This is truly wonderful," exclaimed Fred, as his eyes followed the circle of the valley and beyond. "The surface of this whole mountain outside of the valley is butcher-knives and cleavers; and now at least one mystery about this valley is solved; that is why no one ever attempts to cross the mountain."

"That is precisely so, Fred; and, furthermore, no one has a suspicion that a beautiful valley lies beyond such a terrible surface."

"Then from the appearance of things I should think this whole region is of volcanic origin."

"It certainly is, and I believe that this valley was a volcanic crater years ago; there are even now occasional rumblings, and there are boiling hot sulphur springs in the center of it; but it is now lunch time, and we will hasten to the oak-trees. Sam has not arrived," said the doctor, as they approached the trees; "but he will be here in a few minutes. Let the donkeys graze. Stretch yourself upon this mossy bank, and rest. We would take our lunch at the apiary; but Sam is an arrant coward when near the bees. Hello, Sam! I guess you heard my compliments to you."

"Dat's so, sah, an' dat's so about my gettin' my woolly head neah de bees. Somehow dey don't like de kinks in my har."

"Why, Sam," said Fred, "you must have a holy terror of the busy bee. I believe I could teach you to handle them."

"Don't mention it, Mister Fred. Don't you nebber mention it. De bee am de enemy ob de

tickets to see de show. Just as all de small creeters was a goin' in, dar jus came a hummin' down a hul swarm o' bees, an' dey jus' lit on Mistuss Noah's close-line post. Mistuss Noah said she didn't believe dey wanted so many, an' was goin' to save jus' two bees and scald de rest. But Mister Noah told her to desist, an' she desisted; den he told Ham to put all de bees in a big gourd, an' put dem in de yattick ob de yark. Ham had seen so many fierce beasts a goin' into de yark dat he was full ob self-confidence when he 'proached de little bee, an' he 'fused to put on his ma's brussels-net veil. Worse still, he brushed dem off de post wid an ole stub brush-broom, consequently de bees took a han' in de business, an' stung Ham all over his face an' his head an' his arms, an' he was a diefful sight. When de boys, Shem an' Japeth, got him into de tent he went right into convulsions. De hul family was 'cited 'cept Mister Noah. He shook Mistuss Noah. Says he, 'See he'ah, woman; you jus' stop dat snivillin' an' git a bottle o' wine—some o' dat ol' Canaan wine—quick, too, an' let Ham drink a hul bottle of it. Dat good ol' wine'll contract de sting pizen ebery time.' De Noah family had jus' broke up housekeepin' agin a takin' de navigation ob de yark, an' things was sort o' mixed up in de tent. Mistuss Noah was greatly flusterbated, but she found a bottle, an' Ham's convulsions collapsed long enough fo' him to drink de contents. I 'spect he hear'd 'em say it was good ol' Canaan wine. It had a good effec', howsumebber, for putty soon he sot up, an' says he, 'Ma, what in de dickens was in dat ar' bottle? Now it am down, it don't tas' good. It don't tas' like dat good Canaan wine; it tas' orful bitter;' an' Ham hawked an' spit.

"Mistuss Noah took de bottle an' smelt it, an' says she, 'I dunno;' an' she handed it to Shem, an' he smelt it, an' says he, 'I dunno;' an' Shem handed it to Japeth, an' he smelt, an' he said, 'I dunno;' an' Ham says, 'Pa, do smell ob dat ar' bottle.' Noah left off readin' de daily paper, and took a long smell 'Lan' sakes alive!' says he; 'woman, you gub Ham dat ar' bottle o' brack ink, specially pared from goats' galls, for scribin' de flood.' But in spite ob dat, Ham began to 'prove, an' to turn brack all over. Says Mistuss Noah, one mornin', 'Dat ink seems to be a strikin' in.' 'Nay,' says Mister Noah, 'it am a strikin' out;' an' poor Ham kep' a growin' better'n better, an' bracker'n bracker; an' bein' dat de ink struck in an' struck out at de same time, an' den struck wid de bee-pizen, he nebber got over it—no, nebber, an' unnumbered generations ob his children are brack to dis day, an' dey all hate de bee."

"Well, Sam," said Fred, "that is a most remarkable tradition; but what became of the bees?"

"De stradition don't say; but I 'spec' Mister

"Don mention it! don yo nebber mention it! de bee day am de enemy of de wholl African race,— Yes sar! if dar'd ben no bees dar'd ben no brack mens! suah!— Yo jes hab all dem bees yo like, I got a-nuff, Ha! crackey I guess I don know when I had nuff Mister!

whole African race. If dar'd been no bee dar'd a been no brack men, suah."

"Why, Sam, how in time do you make that out?" said Fred, with no little curiosity.

"It mus' be you nebber heard our family stradition."

"No," replied Fred. "I never did. Your tradition certainly charges the little bee with a mighty transaction."

"You see, Mister Fred, our African family tradition hab it dat dar was Mister Noah, Mistuss Noah, Ham, Shem, and Japeth. Dey all stood aroun de doah ob de yark, a beholdin' de animals goin' in, an' dey was all white sons ob Mister Noah—Ham, Shem, an' Japeth. It must a ben a spirin' scene to see de elephant, de lions, de giraffs, de 'possums, an' de lesser animals, all two by two, a goin' in like one paneramy, an' dey didn't haft to buy any

Noah see to it dat 'nough bees got into de yark for seed."

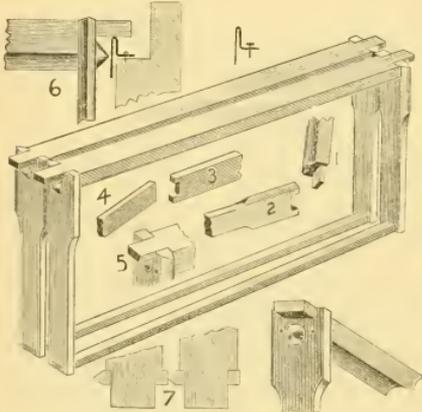

IMPROVEMENTS ON BEE-HIVES AND APPLIANCES TURNED OUT AT THE HOME OF THE HONEY-BEES FOR 1897.

Our policy has all along been to keep fully up with the times, and generally a little ahead of them. We point with pride to some of the innovations that we have introduced in the years gone by. For instance, dovetailing the hive-corners; self-spacing frames; Cowan extractors; new process of comb-foundation making, besides a long list of minor features, all of which have come to stay, and on not one of which have we had to take a "back track." Before introducing them we have taken a deal of pains to investigate and test thoroughly, and the result is that I believe our bee-keeping friends have come to look upon us as rather the leaders in apicultural progress.

During the last two or three years we have made no very great changes; but during this year, 1897, we shall announce in our catalog some improvements in hives and appliances that we feel very sure will be accepted at once. Our new 1897 list will be out, probably, within ten days. It will contain cuts and descriptions of the new features. Among the first is the

NEW 1897 HOFFMAN FRAME.

When we first introduced this frame, some years ago, it took like hot cakes, and the continued and increasing demand for it ever since shows plainly enough that it is a practical labor-saver. It had, however, just one fault; namely, that the bees would stick the ends of the top-bars to the contiguous parts of the hive-rabbit, so that, in order to remove one frame, it sometimes became necessary at some seasons of the year to break this top-bar propolis con-

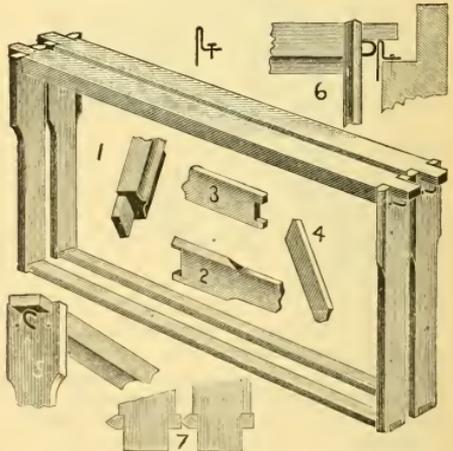

CALLBREATH'S END-SPACER.

nection of several other frames before the frame in question could be removed. We have been studying on this problem for a couple of years. We have recognized the fact that a bee-space around the ends of the top-bars would solve the trouble. The next difficulty was, how to prevent end play. We had thought

of a number of devices, and finally Mr. John S. Callbreath, of Mongaup, N. Y., sent us a frame with furniture-nails under the top-bar, as shown in the accompanying engraving.

I must confess I was at first delighted with the idea. During the summer we tested several hives with these end-spacers on the frames; and to say that I was pleased with them after manipulation was putting it mildly. During the very worst part of the propolis season, and even when it turned cooler, so that the bee-glue would snap, I could handle Hoffman frames with these end-spacers, with my fingers alone. Such a thing as a screwdriver or a pry was unnecessary. The reason will be apparent. The metallic head of the furniture-nail striking against the tin rabbet would offer the bees no chance to propolize: and even if they did attempt to stick it, the points of contact were so small that it practically amounted to nothing. You can set it down as a rule that bees will never attempt to daub up with propolis a point of metal when it comes against a flat surface of metal.

But we met one serious difficulty—the cost. After a good deal of inquiry we were forced to the conclusion that we could not get these furniture-nails cheap enough without tucking on another dollar or two per 1000 to the cost of the frames. Then our thoughts turned to nails, staples, strips of sheet metal, iron buttons, and every thing else in fact. The staples seemed to be the most feasible. But the question was, to devise some simple and cheap way so they would be driven just so far and no further. That problem, Mr. E. B. Weed, of foundation fame, solved for us very nicely, and which I will refer to further on. Well, here is a set of Hoffman frames with staple end-spacers:

THE NEW 1897 HOFFMAN FRAME WITH STAPLE END-SPACERS.

These staples, providing they are driven the right depth, are as good as furniture-nails, and cost only one-fifteenth as much. The expense is so trifling that we have decided to put them on all of our 1897 frames, without additional cost. Of course, it will be understood that top-bars on all such frames will be a bee-space shorter at each end, making them 1/8 inch shorter than the last year's top-bars. The staples are fully as strong, and present as little surface of contact as the furniture-nails; and by the method which I will now describe they can be driven to an exact depth, without any variation.

The engravings below will make the matter so plain that it will hardly be necessary to give the method. In Fig. 6, A shows the gauge, the thickness of which is just equal to the height of the staple in the projection of the top-bar, as at Fig. 1, and the staple dropped into the slot. It is then driven down as in Fig. 2, as far as it will go. The gauge is pulled away, leaving the staple at exactly the right depth, as at Fig. 3. In this connection it might be well to state as shown in the figure, that the projection is exactly  $\frac{1}{8}$  inch, leaving it exactly  $\frac{1}{4}$  inch from the end of the

change the frames, after which proceed to the next colony. All surplus combs not in the hives can be changed over now in the shop. The beauty of this improvement is that every one can adopt it for his own yard, where he has old-style frames; and the benefit is so great that it does not seem to me that any one can afford not to use it. We have already changed over a few of our hives sufficient to know that the work of changing over end-spacers is but slight comparatively. We will furnish the gauges A and the staples B at a nominal sum. By the way, the staple B is not shown its full size of wire. It is, in fact No. 16 wire, and  $\frac{3}{4}$  inches long, made to order, with prong extra wide apart.

end of the staple to the end of the top-bar. Fig. 5 shows a cross-section of the end of the hive and the frame. It will be observed that the bees can clear around the end of the top-bar. This improvement is so important and far-reaching in its benefits, that, just as soon as spring opens up, we shall change over to the end-spacing style of Hoffman in all our yards. It will not be necessary to discard our old frames filled with comb. One man, in three or four days' time, can change over all our colonies. He will carry along with him a light sharp back-saw, and will cut off from each end of the top-bar  $\frac{1}{4}$  inch, and then drive in the staple as per the plan shown in Figs. 1, 2, and 3. Time can be saved by shaking the bees off all of the combs of the colony in front of the entrance and then

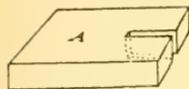

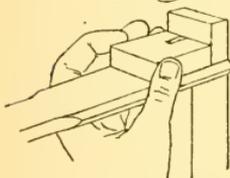

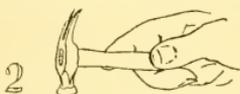

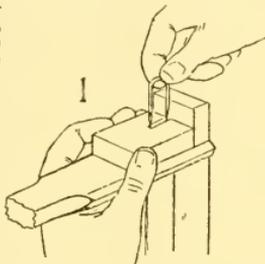

FIG. 6.

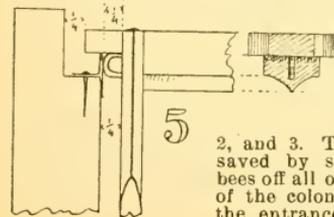

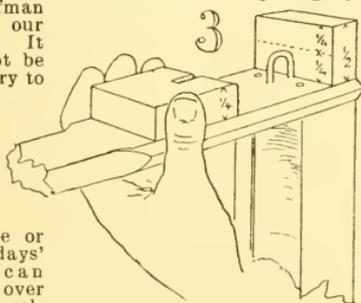

of the hive and the frame. It will be observed that the bees can clear around the end of the top-bar.

This improvement is so important and far-reaching in its benefits, that, just as soon as spring opens up, we shall change over to the end-spacing style

benefits, that, just as soon as spring opens up, we shall change over to the end-spacing style

of Hoffman in all our yards. It will not be necessary to discard our old frames filled with comb. One man, in three or four days' time, can change over all our colonies. He will carry along with him a light sharp back-saw, and will cut off from each end of the top-bar  $\frac{1}{4}$  inch, and then drive in the staple as per the plan shown in Figs. 1, 2, and 3. Time can be saved by shaking the bees off all of the combs of the colony in front of the entrance and then

2, and 3. Time can be saved by shaking the bees off all of the combs of the colony in front of the entrance and then

My, oh my! how are these cold snaps affecting the bees? Ours are all right; but how are yours?

We have so much matter that I find it necessary to cut down the usual editorial space in this issue; and even now I have enough contributed matter on hand to make up almost two whole journals yet. Our contributors will therefore understand why some of their articles have not yet appeared.

OUR SYMPOSIUM; POSSIBILITIES ALONG THE LINE OF THE NEW COMB.

In this issue we have two short symposiums — one on the subject of tall sections, and the other on drawn or partly drawn combs, or, perhaps, it might more properly be styled deep-cell foundation with side-walls and bases as light as natural. Just exactly what we may expect from this new product it is impossible at this time to foreshadow. If it shall be feasible some time in the future to furnish it the same as we do foundation, and at a price within the reach of bee-keepers, great things are possible. Here are a few of them: 1. Bees going into comb honey supers sooner; 2. Securing section honey during off years, when the bees would not draw out foundation; 3. Partial prevention of swarming; 4. Being able to produce comb as cheaply as extracted; 5. Lessening the adulteration evil in proportion to the reduced amount of extracted honey on the market. If as much comb can be produced as extracted, and at a better price, it will be produce more argy; and as retailers and commission men can not adulterate honey in the comb as they can extracted, the bulk of the honey will be the direct product of the hive.

Now, understand that I state that these are only possibilities. While it is possible to produce the new deep-cell foundation in a small way, it may be utterly impossible to make it in sufficient quantity to put it on the market as an article of sale, so we will not

count our chickens before they are hatched. It may be well, however, for us to consider now the mere possibilities, so that those who secure samples can experiment along the lines indicated in 1, 2, 3, 4, and 5.

#### ANOTHER COMMISSION MAN.

MR. O. L. HERSHEISER, Vice-president of the U. S. B. K. U., which is to meet next in Buffalo, it will be remembered, was a bee-keeper who graduated at the Michigan Agricultural College at Lansing, under Prof. Cook. Indeed, I believe he had charge of the college apiary while he was there. He was superintendent of the New York exhibits at the World's Fair; and at present he is an attorney in Buffalo, N. Y., 410 Real-estate Exchange. He has been fighting a certain commission man by the name of Wm. H. Unger, operating under the firm name of Unger & Co., Michigan St., Buffalo. A long tale of this man's misdeeds are set forth in the *Evening News* of Saturday, Jan. 9th. A single paragraph will suffice.

Here is the story of a man who was once arrested for petit larceny and fined \$50 by Judge White, of the Supreme Court, twice arrested for assault (once fined \$20 by Judge King), now at large on his own recognizance, having been arrested by United States Deputy Marshal Kane, charged with using the government mails for the purpose of defrauding farmers, and the climax of whose career is the offer of a bribe of \$2.00 and a box of figs to a young reporter to suppress the news of his arrest, and an attempt subsequently to assault the reporter because the fact was printed. Not satisfied with this, he made a statement to another afternoon paper that the aforesaid reporter had tried to blackmail him.

There are other commission houses in the city of New York that seem to be working on the same line; and it seems to me that bee-keepers by this time ought to know better than to send their honey to unknown firms. Don't trust your honey with them, even if they do appear to give good impressions, and talk about their ratings in Dun and Bradstreet. If there are any other chaps like this man Unger in Buffalo, I am sure our friends will know to whom to look in the way of counsel.

#### FOUL BROOD IN FOUNDATION; APICULTURAL EXPERIMENTS.

SOME years ago the suggestion was made that there was a possibility of transmitting foul brood through foundation; but at the time, we all felt (without making any definite tests) that there was no danger from this source; but Mr. R. F. Holtermann, in the employ of the Ontario government, has been conducting a series of experiments along the line of bee-keeping, and among them was this regarding the possibility of transmitting foul brood through foundation. He selected a very bad case of foul brood, combs being fairly rotten with the disease. These were melted up by very low heat—just sufficient to cause the wax to come to a liquid condition, sufficient for dipping. Sheets were secured from this wax, and they were rolled out into foundation. This

was put into a healthy hive, and the results watched narrowly. The whole season went by and no infection followed. When it is remembered that, in the process of ordinary foundation-making, the wax is brought to a much higher degree of heat than the mere melting-point—about 142—it will be seen that there can be no possible danger of contracting the disease through foundation.

#### FORMIC ACID IN HONEY.

Another experiment was along the line of determining the amount of formic acid in different qualities of honey, obtained under different conditions. He secured a number of samples from different sources—some when the honey was stored rapidly, and some when brought in little by little. These were placed in the hands of a chemist, and tested for formic acid. It was found that there was more of the acid in some honeys than in others, and that there was twice as much in buckwheat as in ordinary white clover. Mr. Holtermann told me that he had always observed that bee-stings were more painful during buckwheat season than at any other time, and wondered if the larger amount of formic acid in buckwheat honey itself, upon which the bees feed, would explain it.

I had always supposed that there was formic acid in honey, but I was not aware before that there was any definite proof. The presence of this acid is probably due to the process of digestion in the honey-stomach of the bee; and—well, I'll not say more for I feel as if I were floundering in the dark. Perhaps Mr. Holtermann or the chemist or Prof. Cook will enlighten us further.

I received the above facts from Mr. Holtermann by word of mouth while he was here a few days ago. By the way, Mr. H. expects to secure the appointment to the position of apicultural experimenter for the general government of the Dominion, at Ottawa. He would be a good man for the place, and I know his friends will be glad to hear of his appointment, which now looks reasonably certain.

MENTHOL honey cough-drops is a preparation on the market that tastes strongly of honey and menthol. An acquaintance, troubled with a hacking cough, tried them and reports that they seemed to give relief. Perhaps there are others who would like to try them, as I understand they are on sale at confectioners' shops. We as bee-keepers need to encourage the sale of any legitimate article of merit having honey as an ingredient. This is not a "paid puff;" indeed, the J. P. Annen Candy Co., of Green Bay, Wis., who put them up, know nothing of this notice.

If your bees are short of stores, and you have no combs of sealed honey in reserve, lay on the frames under the quilt a chunk of Good candy, made by kneading powdered sugar and honey to a stiff dough.

## OUR HOMES.

Be thou faithful unto death, and I will give thee a crown of life.—REV. 2:10.

I had just finished a nice supper, Christmas evening, and the neat and obliging waiter of the pretty restaurant had marked the price "35 cts." on a slip of white paper. As I walked toward the desk I put a half-dollar, as I supposed, with the paper, and laid both on the counter, without saying any thing. The clerk touched his machine. It showed up 35 cts. all right; but instead of handing me 15 cts. only, he gave me another half-dollar with the 15. My first impression was that I must have given him a whole dollar instead of a half; but while I was meditating on it the coins were in my hand, and, being in a hurry, I passed out. Now, I am going to tell the truth about it, as near as I can. While I was going out, self (or *Satan*) suggested, "It is his own job, any way; this trip is costing you quite a good deal; every half-dollar counts; you have got to be a little saving."

By the way, friends, *Satan* does get on a saving mood sometimes. You will remember his suggestion to Judas about being "saving." The trouble is, he always advises saving money that belongs to somebody besides his victim. I was outdoors and had my hands on my wheel; but another and far different voice was saying, "You had better lose a hundred times the amount than wrong your neighbor, even if he did make the blunder. How about your favorite text, of 'being faithful unto death,' and your teaching all along in that line?"

Then it occurred to me that he could probably tell, even yet, what it was I gave him. I went back inside.

"Sir, can you find the coin I gave you just now when I paid for my supper?"

He opened the drawer, snapped his fingers, and colored up.

"I declare, I thought you gave me a dollar; but here is only 50 cts. in the box where the dollar should be."

He thanked me very courteously, saying he feared it was not every one who would take so much pains to correct a blunder of his own making; but I presume it didn't even occur to him that I didn't correct it as soon as it was made. How does it come that I am tried so much in just this way? Is the great God above trying me (and *you too*, my friend) every now and then, to see if we are trying to be "faithful to the end" in loving our neighbor as ourselves? If so, then let us see to it, dear fellow-travelers, that we are not entrapped by the great adversary.

An hour later my ear caught the sound of martial music. It was the Salvation Army. As it was Christmas evening there were quite a few on the streets, and quite a crowd collected around them. A good many did not seem to understand them. Most of them were smoking, some had been drinking, and coarse talk and many oaths were mingled with the beautiful hymns that were being sung. They (the army-workers) finally all knelt in the dusty street; and while a woman was praying for the rough crowd around, one fellow, more curious than the rest, pushed through the circle and came close up to the one who was praying. He looked first at the crowd outside, whom he could understand, then at the little flock on their knees whom he could not understand. Let me digress a little right here:

During all my life—that is, all my Christian life—I have longed for something or somebody who could bridge the gulf between the hard un-

believing world and true, honest, earnest *Christians*, and make the scoffers comprehend what Christianity really is. It wants grace—oh such an amount of grace! to enable believers and unbelievers to even converse together in a neighborly way. Let us consider the scene I have pictured. This stranger stands leaning over the woman on her knees, looking down upon her, probably in pity. He has taken his cigar out of his mouth; and while he puffs a cloud of smoke all over those on their knees, even into their very faces, he looks round inquiringly. I think I can understand the look. To me it seemed as if he were saying:

"Why! what are these blank idiots up to, any way? What is their game?"

The prayer did not attract so many; but when the captain stepped on a chair, and sang one of the sweetest hymns I ever heard, accompanying it with a guitar, they all came thronging back. All at once I was startled by most horrid oaths right at my elbow, and in a woman's voice. Omitting the oaths, she said:

"They lie, every one of them. They ain't a bit better than I am."

I came pretty near smiling at this, for it seemed a little as if she was, to use a slang phrase, "giving herself away." She resumed, "They won't hold out, any way; see if every one in the lot don't go back, before next Christmas."\*

Oh how I did pray inwardly for God's grace to be poured out on that little band, and that they might have the Holy Spirit as on the day of Pentecost, so that all that hard crowd might hear the gospel explained in a tongue they could understand and comprehend. My prayer seemed answered. The woman's fling was taken up. First one and then another replied in substance:

"Watch us and see if we don't hold out."

"We want to be watched." "Some of us have been in the blessed work for many years. We appeal to the crowd. Have any of you ever known a crooked thing in our past record?" No one answered, and then a new recruit took the stand. His testimony was something as follows:

"Friends, this is the first Christmas that I have passed, as a sober man, for 25 years. Just a year ago to-night, I, with a few of the same sort, were engaged in 'painting the town red.' Last June my friends had all given me up; I had given myself up; but these friends here picked me out of the gutter, told me of Christ Jesus, and here I am, by the grace of God."

Even after this, several voices from the crowd declared he wouldn't "hold out." "Boys," said he, "many of you know me. Is it not true that I have been a drinking and profane man for 25 years?"

Many answered, "You are telling the truth now, Jim." "We'll back up that statement."

"Well, has any one of you known of my drinking a drop since these good people lifted me up and had compassion on me?"

Not a voice answered.

After this converted man had finished speaking, one of the officers of the army arose and spoke something like this:

"Friends, this man tells you that, one year ago to-night, he helped to 'paint the town red.' He did not add, but I will do it for him, that to-night he is helping to wash the town white—not whitewashing, mind you. The Salvation Army does not deal in whitewash—we have no use for it; but he, with the rest of us, are try-

\* This woman's talk made me think of the words, "And, behold, they cried out, saying, Who have we to do with thee, Jesus, thou Son of God? art thou come hither to torment us before the time?"

ing to wash the town white in the blood of the Lamb—Christ Jesus.”

Then I thought of the words, “Purge me with hyssop, and I shall be clean; wash me and I shall be whiter than snow.”

As that swearing and drinking crowd of men and women gazed at that little band of Christian workers, it seemed to me that my prayer was answered. The dullest and most obtuse one in the lot could and must, in fact, understand what it meant to be washed clean from all their sins and iniquities. It seemed to me that I never comprehended before so vividly the difference between sin and godliness as we had it there pictured before us. Taking that crowd as it stood, and considering the matter of cleansing them from all their sins and depravity, I should have said, humanly speaking, that it could not be done—that it would be a physical impossibility; and yet the brother's words, which he had just spoken, were still ringing in their ears. The marks of years of dissipation were like furrows, and left their tracks on his poor face; and yet he was actually pleading to have them give up their sinful lives and sinful ways, and trust Christ Jesus. I never before in my life saw such a direct hand-to-hand conflict between Satan and Christ Jesus; and it seemed as though at least once in the world the opposing forces had met. There was not any abstruse doctrine discussed—at least nothing difficult to understand; but it was the one plain simple question, “Will you throw up your old sinful life, and march with us under the banner of Christ Jesus?” Then I thought of the words of that old hymn—

Now wash me, and I shall be whiter than snow.

Other similar testimonies followed, and they were all in a line to support the promise in the text I have chosen. Some of the hymns would have done credit to any concert I ever attended; and after they adjourned to the hall the captain gave us a short sermon that, in my opinion, would do credit to any pulpit. Doubtless unusual preparation was made, it being Christmas night.

I stayed so late at their meeting in the hall it was a little after my usual time when I closed my eyes in oblivion, thinking my conflicts with the prince of darkness were over, at least for that day. Not so, however. I was so tired and sleepy I retired without first opening the window for fresh air, as I usually do. Toward midnight I awoke, feeling the air in my room was not exactly what we get when—camping out under the stars, for instance. Before the closed window was a heavy paper curtain. As this failed to run up out of the way as it should do I held it back with a chair; then as I could not pull the window up, nor find the fastening, I turned on the electric light. Even then I did not succeed in getting the window loose; and to get a better chance I stepped up on the sill. Let me explain that the building was like many in hot climates with adobe walls—two feet thick or more, the windows of the lower story being quite near the ground. Well, as soon as I was up on the sill I found the fastening; but before I touched it I saw that I had attracted the attention of some one at a little distance across the common outside. This some one proved to be a finely dressed woman, and she was tripping swiftly toward my window with its blazing electric light. I stepped down very quickly, removing the chair so the paper curtain covered the window very completely. Tap, tap, tap, came on the glass. I stood very still, and hardly dared breathe. If I didn't answer or move she would surely go away, I thought; but she kept tapping. Finally she essayed to raise the sash; but as I could not

start it from the inside, I felt quite safe. Imagine my consternation when I heard it go the very top with a rush as soon as she touched it. I moved a step or two behind the washstand, while I asked quietly what was wanted. She pushed the curtain aside enough to show her face, and said, as she smiled in an apparently innocent way:

“I only wanted to wish you a ‘merry Christmas.’”

“You have done so; now go away; good-night.”

“Don't be cross,” she added in a lower tone, with something else. Satan in bodily form stood before me, and gave me a brief glimpse of what he could do in getting mankind to fall at his feet to worship him. I stopped her by saying, “There, that will do;” and at the same time I backed toward the door on the opposite side of the room. I made up my mind very quickly that she and I would never be seen in that room together, not even by the holy eye of the great God above. When I started to put out my hand toward the door, then she went away. Was this another test to see if I would be “faithful unto death?” In the early evening I had witnessed what woman can do to raise fallen men; the last few minutes had given me a view of what Satan can do, with woman's help, to drag men down. Under other surroundings and circumstances I should have called this one of the brightest and handsomest women I ever saw; there was a fascination about her looks that, rightly used, might have been a great power for good. I could only groan in spirit as I looked at her. “O God! is it indeed true that some of the fairest and brightest of womankind have sold themselves to the work of ruining the world?”

It sometimes seems as if no power on earth were sufficient to warn men of the danger of trifling with intoxicants, and it is the same with this other evil. Had I lost my hold in climbing Superstitious Mountain, and been dashed on the rocks, there would have been some mourning, especially among my intimate friends; but had I fallen in this other way, my memory would have hardly been worth a funeral at all. A man had better die an honest, innocent death, a thousand times better, than march boldly on to disgrace and ruin. See what God's holy word says about it:

“Can a man take fire into his bosom and not be burned?”

“But whoso committeth adultery with a woman lacketh understanding: he that doeth it destroyeth his own soul.”

“For she hath cast down many wounded; yea, many strong men have been slain by her.”

“Her house is the way to hell, going down to the chambers of death.”

Mrs. Root made me a present of a book. She sent it by mail, so it reached me on Christmas eve. I like it so much I should be glad to have it read by every one who reads GLEANINGS.\* The leading character of the book is a minister who spent his life in hardship in “being faithful unto death,” and near his end he uttered the following prayer while alone by himself:

“Lord, I have groped after thee, and to know thy will, and to do it if I could. I never expected to be happy. Dost thou mean this draught of human joy for me?”

It almost startled me to read it, because several times, recently, I have used much the same sort of prayer myself. You see our friend had “been faithful,” without any thought of reward, and when he breathed that prayer he

\* The book is, “A Singular Life,” by Elizabeth Stuart Phelps.

was just getting a glimpse of the "crown of life" that comes in in the latter part of our text.

"Be thou faithful unto death, and I will give thee a crown of life."

Mr. L. B. Bell, of Camp Verde, Ariz., has charge of two apiaries belonging to Mr. F. E. Jordan. Mr. Jordan is now living in Jerome. More of him anon. Mr. Bell does not get so large a yield of honey by considerable as they do in alfalfa districts. His yield during the season just past was only about 70 lbs. per colony. Their honey is gathered from mesquite and other plants of the desert. The quality of the honey, however, is exceedingly fine; and in Jerome, 30 miles away, he gets for his whole crop 7 cts. a pound. This is nearly double, you will notice, what they get in the Salt River Valley; but it has to be transported all this distance by wagon.

Mrs. Bell was, before her marriage, a school-teacher in the far West. And, by the way, this rough far West is more indebted to the schoolma'ams who have gone away out there to teach than perhaps it will ever realize. And may I suggest right here that I fear that some of the men who have succeeded in getting these schoolma'ams for wives do not always realize how much they have to thank God for? Some of them do, however, evidently, and Mr. Bell is one of these. If I am correct, one reason why he chose that desert land for a home was because of what I have already mentioned—that is, the mother died of consumption, when he was almost too small to remember her very well. He is now rugged and strong, and I should be almost willing to spend the rest of my life in Arizona if I thought I should be able to acquire the endurance to wind or weather, that he seems to possess.

We arrived at his home Jan. 1. In the afternoon we started out to explore some of the ancient cliff-dwellings only a few miles from his home. These dwellings are scattered more or less all through Arizona. The first essential is a cliff. Now, whether the natives in olden times dug back into the chalky rock so as to form caverns, or whether these caverns were made by some flood in former ages, I am unable to say. My impression is, however, that the caves were, at least mostly, washed out by water. The dwellings are usually found where there is a soft stratum of chalky rock between two harder strata or layers. These are never found very near the ground—generally from 30 to 40 feet, and often 100, and in extreme cases 400 or 500 feet from the level. Usually the cliffs are inaccessible unless one uses a ladder, or walks along on the edges of the shelving rocks. Almost every time when I looked at these homes made by that strange race of people a thousand years ago, I would say, "Well, I am pretty sure I should not be able to get up there without ladders or some sort of assistance along that line." But Mr. Bell, our pilot, replied that we could reach every one of them if we hunted up the path used by the cliff-dwellers of old.

A good many times we found holes in the rocks, probably made for the hands, so as to enable one to climb along the dizzy heights. The rooms are usually a sort of cave back in the

rock. The opening to these caves is closed up with pieces of rock and mortar, very much as a stone mason lays a wall nowadays. They did very little stone-cutting, however. The chalky rock pounded up seemed to furnish the mortar. Instead of cutting the rocks with stone cutters' tools they evidently selected such as were fit for their purpose, and showed much skill in laying them so as to have a smooth wall, outside and in. This wall not only closed up the entrance of the cave, but it divides off the rooms inside, or divides one man's house from that of his neighbor. The doors of these dwellings are all low; in fact, it is tiresome, on account of the constant stooping, to explore them. Some of the largest are high enough inside so one can stand erect; but in many of them you will be obliged to sit or stoop down. They are blackened more or less overhead by smoke, and I might almost call it the smoke of ages, for the room still smells of smoke, even though hundreds of years have past since any fire was built. In some of the largest and finest, places for beds or couches were worked out of the solid rock. Much of this work is obscure, however, on account of the great quantities of bat manure that cover the floors. In some of the buildings it is at least a foot deep. Everybody seems to acknowledge the value of this bat guano, or manure; but the expense of hauling it to a railroad station, and then paying the cost of transportation, stands in the way of its utilization. In one of the extensive cliff-dwellings, in their search for relics, it seems to me a full carload of the guano was shoveled out in a heap. Under the influence of the rain it seems to have softened up into a material that looks very much like old well-rotted manure. Our readers may remember that we have already used bat manure, shipped in from some of the Southern States, in our greenhouse experiments.

There have been many conjectures made, to the effect that these cave-dwellers were small in stature. None of the mummies are larger than would be those of children ten or twelve years old. The ceiling to the dwellings would accommodate people of about that height, and their doorways likewise. But it should be remembered that many races, even at the present time, have low doors and low ceilings. They stoop when they go inside, and usually sit on the ground instead of on chairs, as civilized people do. But, to go back to the cliff-dwellings.

One of the most interesting features connected with every one of these old-time homes is one or more little closets opening into the main apartment. These closets are egg-shaped, and are made far enough into the rock so the opening can be closed with stones and mortar; then after it is plastered over with thin mortar, something like whitewash, one would never dream of the existence of this cupboard or closet were it not that the wall sounds hollow when you pound on it where these are found. It has been suggested that these were made for storing their grain. When walled up it was secure from rats, mice, and insects; and in the dry rock it would probably keep several years. On the top of the cliff we found the remains of dwellings made entirely of stone walls. Where these were exposed to the weather, the roof had long ago fallen in and rotted away; but in one place we found a piece of timber over a doorway, and it was still sound. Mr. Bell recognized it as a very durable wood found on the desert. As quite a number of mummies of these ancient people have recently been found, we saw evidences almost everywhere of where the pick had been used in searching for relics.

In almost every one of these dwellings we find little shriveled-up corncobs. It seemed to

me as if they had a kind of corn smaller than any thing we have now in cultivation, for these cobs were not even as large as that from the smallest ears of popcorn. I could not learn that anybody had ever succeeded in getting any of the grains of corn of this kind. If one could find one of these granaries full of grain, that had never been broken open, it would be indeed a valuable "find." These people raised crops, for the old irrigating-canals are found all through the valleys. In fact, quite a few times these same old ditches have been utilized for modern irrigation, and the engineering ability displayed in leading the water on to the land seems to be about equal to any thing of modern times.

The last of my notes in our last issue were penciled while I was ensconced in the hollow of a rock. As I had something of a cold I found a place out of the wind, and in the sun, where I could warm up and write in comfort. The rest of our party were off on the snowy mountain-tops hunting. Right across the river from where I was writing was a considerable town of cliff-dwellings. After the men returned, Mr. Bell said we must certainly visit these, because there were some particular features about them different from those we had visited the day before, that I have just described. The question was, how to get over there. The bank was too steep to get the wagon down; but our horses, being used to mountain climbing, got down without any trouble. We were to cross the river on horseback. I demurred some, fearing the bottom might prove treacherous. Mr. Bell, however, took the gentler of the two horses and rode it through the river back and forth several times. When I saw him raise his feet so as to keep them out of the water I felt considerably nervous at the undertaking. However, we got across all right, and found so much that was wonderful and strange that it was toward sundown before we started to go back. I suggested he should take the same path back through the water so there could be no danger of an accident. We had just got to the point when we were both advised to double up our knees so as to keep our feet out of the water, and were discussing whether we were exactly on the old track. The rushing waters began to make me a little dizzy, and at last I thought it was my imagination that made it seem that the horse was rolling over. In a second more, however, I had to face the stern reality. Mollie got her hind feet into a little spot of quicksand, and with two men on her back she was hardly equal to the task of getting out. I was so used to springing from a wheel and alighting on my feet that I involuntarily sprang from the horse in the same way, and I alighted in the water all right, on my feet; but Mollie, as she went over, struck one of my legs, and there was no help for it—I had to go down in that raging flood of icy-cold water. Mr. Bell, however, spoke quickly and sharply to Mollie; and as he slid off she rallied, and my leg was released almost as quickly as it was pinned. Here was a dilemma. I was pretty well soaked, and we were eight or nine miles from home. Mr. Bell's buoyancy of spirits cropped out even then and there, however. While we were wading out through the rushing water, in a dismally comic tone he said:

"Well, Mr. Root, who would have thought that you and I would have 'fallen out' so soon, and on so short an acquaintance as this?"

In spite of the water that was dripping from me all over, the comicality of the scene struck me so that I laughed till my laughing helped at least a little to keep me warm. As I approached the wagon I asked Mr. Carey, the Quaker, to pull a cushion from the wagon-seat and lay it on the sand. He seemed to be a good deal wor-

ried, but took in the situation, and down I went on the cushion, on my back. Then I raised both feet so as to let the water run out of my boots. I was in such a hurry that I forgot to pull my pants well above my boot-tops, and down went the icy water into my trousers-legs, wetting my clothing, which was comparatively dry until then. We soon learned wisdom, however, and when the last drop of water had dripped from my boots I sprang on to my wheel and started over the desert sand to get up a circulation. After going over a mile I found a farmhouse. The people were all away from home except some girls. I hastily appropriated the big open fireplace, and asked the girl to help me wring out some of my clothing. We were soon acquainted, and got things fixed in pretty fair shape. At this time the wagon had just come up. Some of the girls said a flock of wild geese were down in the field feeding on alfalfa. Now, Mr. Elvey was the hunter of the crowd; and if you want to see him up and dressed in a second, just tell him there is game in sight. The question was, should they bother with the geese when I was in such a plight, and a dark night coming on? I could not keep that desert road after dark; and, furthermore, that Verde River would have to be crossed again about a mile from home. I told them to never mind me, but go and get the geese, and then make the horses do their very best to catch up with me shortly after I should reach the river. I made the seven miles, and reached the river just as it was getting too dark to keep my wheel off from the thorns and cacti. But I tell you I made that wheel fly. I was warm and comfortable, but getting pretty well tired from so much wet heavy clothing. I reached the river, and decided there was no other way than to ride back until I should meet the team, even though it was getting to be too dark to see. Before going many rods I met the team, coming up on a gallop.

"How many geese did you get?"

"Didn't get any geese, but we made the feathers fly," said the Quaker.

Somebody else replied, "It is true, the feathers *did* fly—when the geese did, as they always do." And then it transpired that they felt so anxious about me they did not wait to get within decent range of a flock of fifteen or twenty wild geese. These fowls are ravenously fond of alfalfa, and will return to a field again and again, even after having been driven away by firing at them.

I reached the friendly home of Mr. Bell in pretty good trim. By chance a roaring fire was ready, and I was soon safe from harm. The next morning I think I was rather better if any thing. The plunge bath of icy water did me no harm. And here is a lesson for us, friends: In cases of this kind, when you get into the water nothing is necessary but to keep up the temperature by means of brisk or violent exercise. If you can not do any better, walk briskly till you can get shelter. A drink of hot water may be all right, if the patient can be afterward protected from the weather. Usually a brisk walk will of itself keep one from taking cold.

THE SEVERE COLD, LAST WEEK IN JANUARY.

During the past few days the thermometer has been down 16 degrees below zero; at least, that is what it recorded Monday morning—the

coldest weather we have had here for fully 25 years, if I am correct; but I am happy to say that our little greenhouse across the way came through it all, just smiling. Nobody went inside it from Saturday morning until Monday morning. Of course the exhaust steam was shut off Saturday night, but the hot ground kept the hot water circulating all day Sunday; and even Monday morning, before the engine started, the lines of hot-water pipes were plainly visible through the frost overhead on the glass. The house contained lettuce, and it had been making most wonderfully rapid growth. When I left home Dec. 1 I told the boys we wanted the center beds arranged for sub-irrigation, and just 6 weeks later they showed me the finest crop of lettuce, almost, I ever saw in these very beds where they had done the work. Sub-irrigation and hot-water heating by exhaust steam is certainly the thing for lettuce-growing. At present writing we can't exactly say whether our glass-covered beds outside have sustained any injury or not; that is, every thing was pretty well covered with snow during the big freeze, and is yet, Jan. 30, 1897.

**THOROUGHbred AND NEW QUEEN FOR SECOND CROP.**

I did well with the 1 lb. of Thoroughbred potatoes. First crop, 55 lbs.; 1 peck, planted in July, second crop, made 1 1/2 barrels. New Queens also did splendidly. New Queens and Thoroughbreds excelled Triumphs in West Tennessee for second crop. Lytle, Texas. F. J. CRADDOCK.

**MAULE'S THOROUGHbred IN NEBRASKA.**

Mr. Root:—The pound I got of you last winter for a new sub-critter did pretty well. I got *seventy-nine pounds* from one. The largest potato weighed 1 lb. 9 oz. Weighed six of them, and they weighed over 8 lbs. They are not as early here as advertised. We have several kinds earlier. R. CHINN. Wakefield, Neb.

**THOROUGHbreds IN OREGON.**

The one pound of Maule's Thoroughbred potatoes you sent me as a premium yielded me 71 lbs. of fine potatoes. Single specimens weighed from 2 1/2 to 3 lbs. J. Y. KAUFFMAN. Veronia, Or., Nov. 30.

**THE NEW CRAIG FOR SPRING EATING.**

The early September frost caught them growing well, and have shortened the yield materially. I have 30 bushels, with the small ones out. They are the finest spring eating potato I ever saw, and better very little about sprouting. W. H. S. GROUT. Clark, N. Y., Dec. 26.

**Special Notices in the Line of Gardening, etc.**

By A. I. Root.

We have made a careful examination of most of the catalogs of reliable seedsmen, and find very few seeds of any kind lower than our prices, and these prices we are going to meet; viz., Yellow Globe Danvers onion seed we will make 5 lbs., by mail, postpaid, \$3.00; and Pritzetaker onion seed, 5 lbs., by mail, postpaid, \$6.00. American Wonder peas, \$1.25 per peck; \$4.50 per bush., f. o. b. Medina.

**QUALITY OF SEEDS.**

In regard to the quality of our seed: We are taking more pains that we ever did before to get only the best. Seeds that we grow ourselves we know are all right; and those we buy of growers with whom we are personally acquainted we feel sure they are all right. Where so much is at stake, there are certain kinds of seeds that we would not purchase or take at any price unless it was from some person who is not only reliable but has interest enough in the matter to make them as careful as ourselves.

**MAULE'S EARLY THOROUGHbred POTATOES; REDUCTION IN PRICE.**

The friends will remember that, some time in the fall, I said if any reliable potato-grower offered potatoes any cheaper than we did we would make the price to correspond. We now notice that three or more reliable firms are offering Maule's Thoroughbred at \$5.00 per bbl.; therefore this will be our price until further orders. Those who have purchased at larger prices will please notify us at once, and have the amount over placed to their credit. We make this offer also in regard to any other potatoes that we may offer for sale. We will make our price as low as that of any responsible grower, with this exception: A variety that becomes scarce, and is sold out or nearly sold out, will not, of course, be rebated.

One pound, by mail, postpaid, 40 cts.; 3 lbs., by mail, postpaid, 75 cts.; 50 strong eyes, by mail, post paid, \$1.00; 1/2 peck, 50 cts.; 1 peck, 80 cts.; 1/2 bush., \$1.50; 1 bush., \$2.25; barrel of 11 pecks, \$5.00.

**Philadelphia and New York Branch of The A. I. Root Co.**

I have decided, as I live (Wyndote) on the main line between Philadelphia and New York, and do considerable business that takes me to New York repeatedly to ship goods from either place at Root's current prices. This will enable all parties living in New York State or New England to get goods for very low freight. The A. I. Root Co. carry a large stock at my place, and orders filled and prices made the same as if ordered from Medina. Address main office, THE A. I. ROOT CO., Wm. A. Selsor, Mgr., 10 Vine St., Phil., Pa.

**Bargains in Second-hand Bicycles.**

We have on hand two ladies' Deffance bicycles, made by the Monarch Cycle Co., of Chicago, and listed at \$75.00. These are last year's models, and were used by the women of Rootville last season. The two machines are in first class running order; and as they were ridden but little they are practically as good as new. They have Garford spring saddles, reversible handle-bars, 1 1/2-inch tubing, Morgan & Wright quick-repair tires. Weight, 25 lbs. each. Catalogs and particulars will be furnished on application. We will re-enamel them, and sell them for \$40.00 each, or the two for \$77.50. Beeswax or honey at market prices will be accepted in payment. Reason for selling—we are going to have a tandem instead for '97. THE A. I. ROOT CO., Medina O.

**Dovetailed Hives.**

Sections, Extractors, Smokers, and every thing a Bee-keeper wants. **Honest Goods at Close Honest Prices.** 60-page catalog free.

J. M. JENKINS, Wetumpka, Ala.

**ROOT'S GOODS.** (Get discounts on early orders for 1897. A. I. Root Co.'s bee-supplies always on hand. Better prepared than ever to fill orders promptly. 36-p. catalog free.)

JNO. NEBEL & SON, High Hill, Mo.

**FOR SALE.**—1000 lbs. nice comb honey in 12-lb. cases. L. WERNER, Edwardsville, Ill.

In writing advertisers please mention GLEANINGS.

# Everybody Interested in Gardening

Absolutely needs our **New Seed and Plant Book**. It is the Gem Catalogue for 1897, and full of inducements that appeal to every one having a garden. We offer this year 6 **Choice Novelties in Vegetables**, one packet of each, for 15 cents. 6 **Choice Floral Novelties**, one packet of each, 15 cents. Both collections, 12 packets, for 25 cents, postpaid. 5 pounds of the leading varieties of Onion Seed delivered to any post-office in the United States for \$3.00. Our Up-to-date Collection of 8 Ever-blooming Roses is a wonder, for only 50 cents, postpaid. Almost every page contains offers equally desirable. Do not think of ordering Seeds, Plants or Bulbs from any one before you have this book. It will be mailed free to all sending their address.

W.M. HENRY MAULE,  
1711 Filbert St., Philadelphia, Pa.

Honey Column.

CITY MARKETS.

SAN FRANCISCO.—Honey.—Fancy white, 10@11; No. 1 white, 9@10; fancy amber, 7@8; No. 1 amber, 6@7; fancy dark, 5@6; No. 1 dark, 4@5; white extracted, 2@2½; amber, 4@4½; dark, 2½@3; beeswax, 25@25. Demand and stocks are light.

HENRY SCHACHT,  
 San Francisco, Cal.

KANSAS CITY.—Honey.—Fancy white, 14; No. 1 white, 12@13; fancy amber, 11@12; No. 1 amber, 10 @11; fancy dark, 10; No. 1 dark, 8; white extracted, 5½@6; amber, 5@5½; dark, 4@4½; beeswax, 25.

C. C. CLEMONS & Co.,  
 423 Walnut, Kansas City, Mo

MINNEAPOLIS.—Honey.—Fancy white, 13@14; No. 1 white, 11@12; fancy amber, 9@10; No. 1 amber, 8@ 9; fancy dark, 7@8; No. 1 dark, 6@7; white extracted, 6@7; Utah, 5@6; amber, 5@6; dark, 4@5; beeswax, 25@26. Market very quiet, and little doing. Comb honey fairly well cleaned up, and shipments salable on arrival.

S. H. HALL & Co.,  
 Minneapolis, Minn.

PHILADELPHIA.—Honey.—No. 1 white, 9@10; fancy amber, 8@9; No. 1 amber, 8; fancy dark, 7; white extracted, 6@7; amber, 5; dark, 4; beeswax, 26. The honey market is much depressed at present. Very little fancy comb, and not much call. The season is getting late, and we are pushing extracted honey.

WM. A. SELSER,  
 No. 10 Vine St., Philadelphia, Pa

DETROIT.—Honey.—Fancy white, 13@14; No. 1 white, 11@12½; fancy amber, 10@11; No. 1 amber, 9 @10; fancy dark, 8@9; white extracted, 5½@6; amber, 5@5½; dark, 4; beeswax, 25@26.

M. H. HUNT,  
 Bell Branch, Mich.

CINCINNATI.—Honey.—No. 1 white, 12@13; No. 1 amber, 11@12; No. 1 dark, 10@11; white extracted, 5@6; amber, 4@5; dark, 3½@4; beeswax, 22@25. Demand for all kinds of honey is exceedingly long.

CHAS. F. MUTH & SON,  
 Cincinnati, O.

ST. LOUIS.—Honey.—Fancy white, 12½@13; No. 1 white, 11½@12; fancy amber, 9½@10; No. 1 amber, 8½@9; fancy dark, 8@8½; No. 1 dark, 7@8; white extracted, in barrels, 5@5½; in cans, 6@6½; amber, in barrels, 4@4½; in cans, 5@5½; dark, 3½@4; beeswax, 23½@24. The movement of honey has been rather slow this season.

WESTCOTT COMMISSION CO.,  
 213 Market St., St. Louis, Mo.

CHICAGO.—Honey.—Fancy white, 12; No. 1 white, 10@11; fancy amber, 9@10; No. 1 amber, 7@8; fancy dark, 7@8; No. 1 dark, 7; white extracted, 5@7; amber, 5@6; dark, 4@4½; beeswax, 25@27. Very little call for honey of any kind.

R. A. BURNETT & Co.,  
 163 So. Water St., Chicago, Ill.

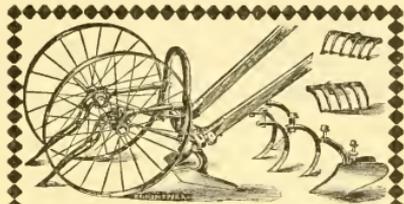

BOSTON.—Honey.—Fancy white, 13; No. 1, 11@12; fancy amber, 10@11; white extracted 6@7; amber, 5@6; beeswax, 25. Dark comb honey will not sell in this market, but fancy honey in cartons will go very well. Supply fair, and light demand. Beeswax is in short supply, and wanted.

E. E. BLAKE & Co.,  
 57 Chatham St., Boston, Mass.

COLUMBUS.—Honey.—Fancy white, 12½; No. 1 white, 11; fancy amber, 9. Weather very cold, but very little doing.

THE COLUMBUS COM. & STORAGE CO.  
 409-413 N. High St., Columbus, O.

FOR SALE.—600 lbs. extracted honey, in new cans and cases, \$375.00. Speak quick; who wants it?  
 ELIAS FOX, Hillsboro, Wis.

 Box B, Minerva, Ohio.

# See what **NEW SUBSCRIBERS** are Offered.

New subscribers are what every journal most earnestly desires. As a matter of course, if the journal is good, most of the old subscribers will stay by it; but to get *new* subscribers, to get the journal into the hands of *new* men, that they in time may thus become old subscribers, is what every journal strives for most earnestly. To this end I make the following offers. For \$1.00 I will send the **Bee-keepers' Review** for 1897 (and throw in the December, 1896, number, which is especially good) and the 50-cent book, "Advanced Bee Culture," or, in place of the book, 12 back numbers of the **Review**. For \$1.50 I will send the **Review** and a fine, tested, Italian queen—queen to be sent early in the season of 1897. For \$2.50, the **Review** and 1000 No. 1 first-class one-piece sections. But, remember, these offers are only to those who are not now subscribers to the **Review**, and as a special inducement for them to try the **Review** at least one year.

W. Z. HUTCHINSON, Flint, Mich.

## It is here.

The year 1897 is here, and we are happy to inform our friends and customers that we are now better prepared than ever before to fill your orders for queens and bees. We have the largest stock ever operated by us, and we mean to be ready with plenty of bees and queens to fill all orders without delay that are sent to us.

Bees by the pound, \$1.00; ten or more pounds, 90c each. Untested queens for 1897, \$1.00 each in February, March, April, and May; \$5.00 for six, or \$9.00 per dozen. For larger amounts write for prices. Have your orders booked for your early queens. Safe arrival guaranteed.

Root's goods, Dadant's foundation, and Bingham smokers. A steam bee-hive factory, and all kinds of bee supplies.

The **Southland Queen**, the only bee-paper in the South, monthly, \$1.00 per year.

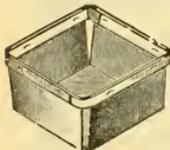

Send for catalog, which is almost a complete book on Southern bee-keeping, giving queen-rearing in full, all free for the asking. If you want full information about every thing we have, and the bee-book, don't fail to ask for our 1897 catalog.

No. 4

FROM DR. C. C. MILLER.

TRY HONEY in your hot drinks. Costs more, but it's more wholesome. I use it in coffee.

I DON'T KNOW whether I can fully answer F. Greiner's question why bees gnaw the cappings of sections in one case and not in another; but I know one thing that probably he knows, that blood makes a big difference. Black bees are ever so much worse than Italians.

W. K. MORRISON is one of the men who have faith in *Apis dorsata*; but he believes in common sense, and says, in *American Bee Journal*, "Many will agree with Dr. Miller when he suggests that those who go after new races try them on their own ground, for it is common sense."

FOR PERMANENCY of honey sales, give more attention to consumption of honey by children. It's said you can't make honey a staple—people tire of it. I doubt if that's true as applied to children. Let them have it constantly *ad libitum* from childhood, and they never seem to tire of it—at least some of them.

T. P. ANDREWS says I've omitted from the list of defunct bee-journals *The Bee-keepers' Journal*, published by H. A. King & Co., from about 1870 to 1873, when the *Bee-keepers' Magazine* took its place. Practically it was only a change in name, but it should add about three years to the life-lease of the *Magazine*.

THAT BIG CAVE of bees with tons of honey has again been discovered, with a stream of bees like a tar rope two feet in diameter. This time it's in the mountains of Pennsylvania, and the only way to get at it is to blow up the mountain-side with dynamite. The truthful narrator in the present case is the *Philadelphia Times*.

IF F. L. THOMPSON will look far enough back on his files, I think he'll find that I told the very thing he asks for, on p. 81. I've sent honey in a trunk to his State, done up in a paper

just like sugar. Simply turn the crock or barrel of honey on its side and let it drain days enough. But it won't work with all kinds of honey.

FRIEND GETAZ, I'm not so sure that your theory, p. 89, that old queens encourage paralysis, is correct. I'm a honey-producer, and have had lots of old queens and many cases of paralysis, but it never amounted to anything except in one case. Did you ever hear of its being bad in the North? It's you southern fellows that catch it.

IF HALF THE EFFORT that has been expended in securing additional yellow bands had been made to secure longer tongues, it is possible that we might be now selling crops of red-clover honey. [I am glad to see that the craze for yellow bands has very perceptibly declined. Perhaps we can now begin to turn our thoughts toward securing bees for business.—ED.]

HONEY-CARAMELS may be the thing, friend Thompson, that you are groping after on p. 82. They cost less than capsules, and are not so suggestive of medicine. [Dr. Miller sent us a sample of honey-caramels that were just delicious. I believe the recipe originated in his own family; at all events, it is given in the honey-leaflet now for sale, and mentioned in another column.—ED.]

TALL SECTIONS require more foundation to fill them, says C. Davenport, p. 85. With the same thickness of comb, I don't see why an oblong section should take any more foundation than a square one of the same weight. [With the same thickness of comb, no more foundation would be required; but the tall sections contemplate thinner combs, and, of course, that would mean more foundation.—ED.]

IF BUCKWHEAT HONEY has twice as much formic acid as clover, then foul brood ought not to be so bad with buckwheat. Wonder if there's any difference in fact. [If formic acid is going to do anything toward curing or keeping down foul brood, there will, perhaps, be less of that disease where there are large quantities of buckwheat honey produced. But why should

there be more formic acid in buckwheat? Perhaps it requires more of it as a preservative, for indeed this acid is a strong antiseptic.—Ed.]

THAT NEW SPELLING on page 77 so "astonish" the Medina printers that it "knockt" 'em clean out. They got that straw badly "mixt," and the last two lines of the page have "swapt" places. [The "swap" was discovered in our office after it was too late to swap back again. As the lines now stand they make Dr. Miller say just what he did not want to say; yet I hope most of our readers were able to recognize the discrepancy.—Ed.]

A FORMER EDITOR—one who had snap too—writes that in the list of defunct bee-journals I ought to have included some that are dead but still appear regularly. Perhaps he thinks it might be said of them as was said by the Irishman of the turtle which walked around long after its head had been cut off: "The crayture's dead, but it's not sinsible of it." [Yes, perhaps there are one or two that might very properly be classed as dead so far as any influence or effect they have upon general bee-keeping is concerned. But, say—if you had mentioned their names, I rather imagine *you* would have found they had a spark of life left.—Ed.]

I'M WONDERING what sort of Miller feeder Wm. G. Hewes has when he says, on page 84, "Unless it fits the super very snugly, many bees will be drowned." What's a super on the hive for? and how do the bees get in the feed? There's no possibility of my bees getting drowned unless they get under the cover from the outside. How is it in Medina, Mr. Editor? [No trouble about bees drowning in the Miller feeder, at our yard. In fact, it is absolutely impossible for the bees to get at the feed except through the narrow passageways; and in them the bees can not by any possibility be drowned. Perhaps friend Hewes did not use them in closed supers.—Ed.]

I'VE BEEN USING frames with top-bars  $\frac{1}{4}$  inch short at each end, like those on p. 94, and I think it's a fine improvement. I've been using that gauge on p. 95 for two years, and like it. But I like the end-spacer I sent you better, I think, Mr. Editor, than staples. [Yes, indeed. For the last two years a number of letters have passed between Dr. Miller and ourselves regarding the advantages of having a bee space around the ends of the top-bars; and his experience has been exactly our own; namely, that it is indeed a "fine improvement." But until this year we did not decide to list it in our regular hive combinations. The "end spacer that Dr. Miller refers to is simply a wire nail driven through the end of the projection of the top-bar from the top, diagonally, into the end-bar. This feature will be illustrated a little later on; but it seems that friend Boom-

hower has been using this device for a number of years. For further particulars see editorials.—Ed.]

"IN EXAMINING sections in their various stages of progress we invariably find them on both sides alike, drawn out and filled, or so nearly alike that a swinging one way or the other, by greater weight on one side, could not be caused."—G. C. Gretner, page 86. Friend G., it must be you never have weak colonies or poor harvests. I've had lots of sections fastened to separators by lop-sided building. But since using bottom starters I've no trouble. [Dr. Miller uses square sections. In fact, I believe he always has used them; so the trouble with comb being fastened to the separators would be little if any worse with tall than with square ones. Dr. Miller very truly says, a bottom starter would remedy that. See Doolittle's article in current number.—Ed.]

HOW TO BAKE honey-jumbles is inquired about by "Texas." We bake 'em just like cookies. Mix together the honey, molasses, and lard. Add the salt. Dissolve the soda in the water, and stir thoroughly into the mixture. Add the vanilla. Stir into the mixture a part of the flour, reserving the rest to roll out with. Roll about half an inch thick, and cut out with a doughnut or jumble cutter, which leaves a hole in the center. Grease the pans before putting in the jumbles, and bake in a medium oven. [The complaint at our house in regard to making jumbles is that the dough is rather too sticky to handle easily; still, the women-folks around Medina seem to make quite a success of the jumbles. Every once in a while an employee will lay upon my desk samples of his wife's make, and they are all good. This goes to show that the recipe is a success, and that any good cook can make *good* jumbles. The home-made will be better than the bakers', because, as a rule, a finer article of honey will be used.—Ed.]

---

I have a great deal of faith in the bee-sting cure for rheumatism, having suffered a number of years, and since I have kept bees it has disappeared. Whether the stings did it, or whether eating honey did it, I can not prove; but I am inclined to give the bees the credit.

Ottawa, Ont., Jan. 11.

J. FIXTER.

WOOD SPLINTS FOR FRAMES OF FOUNDATION.

GLEANINGS for Nov. 15th reached me here. Referring to your editorial comments, that wiring would be more expeditious than setting of foundation with wood splints, I would state that about 120 frames per hour can be easily filled by experienced hands ready for the bees to begin work upon, using 7 splints per frame, which is a sufficient number of splints for medium brood foundation. B. F. AVERILL.

Middletown, Mass., Jan. 1.

By R. C. Atkin.

#### ALFALFA HONEY; ITS CHARACTER; TENDENCY TO GRANULATE.

The quality of this honey is very good. My experience is that it is fully the equal of white clover in respect to color, though some from other States or elsewhere report it as amber in color. Possibly soil or other conditions have to do with color; but my opinion is that the great bulk of it is white. In body, it is very heavy. It frequently becomes so very thick and tenacious that it can not be successfully extracted unless at a temperature of nearly 90 degrees F. In flavor it is quite mild. There is an entire absence of that sharp twang peculiar to white clover. Many people who could not eat honey in the East are very fond of alfalfa, and eat it with no evil effects. It is a rare thing to find one who dislikes the alfalfa flavor if he likes honey at all, and very many will eat it who would not eat other honeys.

Now, while the body, color, and flavor are excellent, there is one feature that is against it; and that is its tendency to granulate. Alfalfa comb honey, as a rule, will not keep over winter without granulating to some extent, both in brood-combs and sections. Let me say right here that I anticipate a thumping from some of the alfalfa-producers; but, thumping or no thumping, I want to tell the truth. If telling this truth about it will injure its reputation, it will have to bear it; but the fact remains that its good qualities will find it a market in spite of the one failing.

Extracted honey will candy solid in ten days to six weeks from extracting. With me it does this *every time*. This candying is a more serious question when extracting than if comb is produced. If the last extracting be a month later than the first, the first will be solid in tanks, cans, or whatever in, before we have time to get it in shape to retail. Wherever a bit of the honey stands for two or three weeks it *must be heated to get it out*. This question has become so serious with some of us that we think of adopting altogether different methods from those now in vogue in the matter of marketing extracted honey. The marketing question I will handle by itself, so drop it here.

#### OTHER HONEY-PLANTS.

The noted Rocky Mountain bee-plant (cleome) grows quite freely in some parts of the State. This plant is a great favorite with the bees, and, like the sweet clover, will be covered with

bees. Several times I have had occasion to photograph it, but it seemed that the bees could not be kept off long enough to let it become still. This plant is quite peculiar in some of its habits. It seems to prefer a dry soil, often growing on gravelly, barren-like places that grow little else. While it will grow luxuriantly on good soil, it evidently will not thrive with "wet feet." It is strictly an annual, growing two to six feet high. When crowded together, plants usually attain an average height of two to three feet; but if not crowded they grow four to six feet, and spread their branches to a diameter of three to four feet. Like nearly every other plant that succeeds in dry soils, it has the characteristic long tap root. The bloom is a pinkish purple, and a very pretty one.

The cleome honey is just enough amber that it can not be strictly called a white honey. The flavor is a little bit rank at first; but when well cured it becomes rather mild and not unpleasant. In flavor I would class it with heart's-ease, and in color a little whiter than heart's-ease.

#### SWEET CLOVER.

This plant is so well known that it needs no detailed description. It also has the penetrating root, grows on almost any soil, and yields a good grade of semi-white honey. The plant has been said to prefer a dry soil. In Colorado it grows well along ditch-banks, on bottom lands, and near the margin of swamps. I should say it favors a rich, moist, but well-drained soil. I say it grows on ditch-banks, and so it does. The Easterner would associate a ditch with a swampy, heavy wet land. In this country a ditch is rarely built for *drainage* purposes in soggy land, but through high, dry, rich farm land, to convey water to irrigate growing crops. The soil is rather clayey, and, though the ditch have a continual running stream, the water does not "percolate" (seep or waste through the soil) sufficiently to keep alive a shallow-rooted plant a distance of one rod from the ditch. Our ditch-bank, then, means a well-watered, well-drained soil; and in such, sweet clover thrives.

I have no other honey-sources that give a surplus except sometimes red clover. The red-clover honey is almost an amber, and has the decided clover twang. I would class it as first grade, but at the bottom of the grade.

We have a weed that I think is peculiar to the West, and of which I can not recall the botanical name. It has the sunflower form of bloom, about one inch in diameter, and yellow. The plant grows about one to three feet high, and blooms in August and September. It is called here resin-weed, because the leaves and branches have a glossy, gummy surface. It yields much pollen and a little honey. The honey has a golden tint and somewhat rank flavor, though not bad, and candles very quick-

ly. One of our apiarists, speaking of it, said, "When the bee works on the resin-weed it hies itself home quickly to unload before the honey candies in its sac."

#### CONDITIONS UNDER WHICH THESE PLANTS YIELD HONEY.

There seems to be something in weather conditions that none of us understand, that seems to stop all secretion of nectar when we would expect it to be otherwise. Such times we *seem* to have right conditions, yet no secretion takes place. This I can not at all explain. Aside from this I will speak only briefly of conditions. I find alfalfa yielding well in steady settled warm weather, preceding thunder storms, and right through *local* thunder-showers; but immediately following a *general* storm the secretion is very light. Cleome yields best early in the morning, and when the weather is slightly cool and damp. Work begins much earlier in the morning on cleome than on alfalfa, and ceases earlier in the day. This would indicate that heat is necessary for alfalfa, and cool weather for cleome. Sweet clover seems to be less affected by either heat or cold, though I am inclined to believe that it does best with a good degree of moisture. I know bees will work it in damp heavy weather. Sweet clover, I think, is not worked so early in the morning as cleome, the latter being worked promptly as soon as the bees can get out in the morning. There is one thing that I have observed for many years—that bees are eager for pollen in the morning. There is considerable primrose in my neighborhood, and the bees will rush for that in the very early morn, and come in with great trailing loads of pollen. Corn is also visited in the early morn. I do not know whether or not it is a provision of nature that the pollen-bearing plants should yield in the morning more than at any other time, but I do know that more pollen is gathered in the early part of the day.

The past two years have been very poor honey seasons in Colorado. Both years we had a good bloom. I thought each season that the prospect was good for a crop of honey, yet it seems there have not been poorer years since the country was settled. The year 1895 was what is called there a wet one. A wet year means one in which there is almost sufficient rain to grow crops without irrigation. Neighbors continually asked if the bees were doing well. I would reply they were not. Why? What is the matter? Is it too wet? Then 1896 was dry and hot—not unusually dry, but unusually hot. For Colorado there was a reasonable amount of rain, but a shortage of snow in the mountains to supply irrigating-water, hence many farms suffered for water, while others had a plenty. Again, the people would ask the same question, only this time it was "too dry" instead of too wet. There is yet that some-

thing which we do not understand that causes the bloom to secrete or withhold its nectar. I believe that good growing conditions are necessary in all cases, but I can not get rid of the thought that electricity has much to do with it.

#### OBSERVATION AND EXPERIMENTS.

I wish there could be a concerted action on the part of a number of stations throughout the United States, each station to keep a daily record of barometer, thermometer, precipitation, clear or cloudy, whether storms are local or general, both general and particular weather conditions throughout the year; and at all times during the honey-flows, or when there ought to be flows, have two or more colonies on the scales, and a daily record of gain or loss. I say two or more colonies, because I am satisfied that, when there are different *kinds* and *fields* of bloom at the same time, bees of different colonies will be working in different fields. I believe this because certain colonies will rob at certain places, and other colonies in the same yard not know where the honey is, or even find it at all. I believe there is some sort of manner of communicating or imparting the whereabouts of sweets, and one colony may get started in one field and another in another field; then if the one on the scales should be on a certain field that is cut down, there would be an interruption in the work of that colony that would not appear in another. If we are to get at the truth promptly and definitely, we must do both comprehensive and detail work.

I believe that soil has some influence on the secretion. It may be that certain plants must have certain elements in the soil that are peculiar to their health and growth in order that they may yield well. As before explained in these articles, there is a great diversity of soils and climate in Colorado. Loveland is in the Big Thompson Valley. Fort Collins is in the Poudre Valley. These places are only about 15 miles apart, yet there is considerable difference in the soils. Each valley is watered by the stream of the valley. My observation for the past seven years is that the honey-flows in the Poudre Valley have been better than in the Thompson Valley. The climate is the same, for it is an open country, and very similar in nearly all respects.

Now as to some method of getting these observations accomplished. I do not know how we can do it; but I have no faith in government work, because there is too much patronage to get the proper persons to do the work. If the government does undertake it, it takes a long time to get the thing a going, and we lose interest before it is accomplished. We must wait and work for appropriations. After the work is done we must wait for all the red-tape business before it is reported. I am not attacking the government, nor saying that it is not able to do such work. It is able, and should do

it; but there is too much of the "party" and "spoils" element to get what we want. I am sure that many bee-keepers throughout the country would gladly do the work if they were furnished with the facilities. Many are now doing just such work on their "own hook;" but the good results are lost by not having the work complete and systematized, and because there is no way to get the results together, and compared, etc.

I have brought up this subject now that perhaps the fraternity may get together in some way the coming season in some thorough observations in regard to the pursuit. I must say that apiarists are not organized as they should be; that our product is practically turned loose to get to the consumer in a haphazard manner. Comb honey is much better marketed than the extracted, but there is need of reform in both. I propose, however, to discuss this matter later. so leave it here.

---

## PRINCIPLES OF HONEY-CONSUMPTION; POSSIBLE APPLICATIONS.

### ONE-OUNCE HONEY-PACKAGES.

By F. L. Thompson.

Communications to the bee-papers on selling honey are apt to be misleading on this point. They always tell how people who at first said, "I don't like honey," after being persuaded to take some of a first-class quality changed their minds, and ever afterward liked it very much, and bought in quantities. This is no doubt true so far as it goes. But there are plenty of people who quickly get tired of the very finest honey, when they try to eat it according to the mistaken notion that it is always a staple food. Why not recognize this truth? One woman, after several times buying my best honey, both comb and extracted, said she would not want any more that winter, as her family had become tired of it, and preferred maple syrup on their buckwheat cakes. I couldn't blame her, for I prefer maple syrup myself for that purpose. The truth is, there is a large class of people to whom honey is a radically different article of food from syrup, and can not possibly be eaten in the same way and with the same relish. People who belong to the other class, those whose palates and stomachs accept honey as a superfine syrup, to be consumed in like quantities, will be surprised at this assertion, and think there is something wrong about it. But in this matter they should not judge others by their own experience. Articles by "Novice" on pages 92 and 300 of GLEANINGS for 1895 recognize the true state of affairs. *De gustibus non est disputandum.*

What applies to private tables applies also to hotels and restaurants. But in applying small individual portions as a remedy, we are met

with a difficulty, though not an insuperable one. There is no satisfactory package at present available. It must be quite cheap, for the quantity of honey is small; it must not be expected to be returned for refilling, for I am informed that restaurant people are such a careless set as to put this out of the question; hence it must be of a kind that can be discarded after getting the honey out. Glass is too expensive. Perhaps hardened paper would do. Or possibly a special size and shape of gelatine capsules (of course, not to put in the mouth, but simply as a package) could be ordered from manufacturing chemists. They would show off the honey nearly as well as glass. Why should not some of the supply firms take hold of this thing and keep such packages in stock? The first step is the hardest. Many bee-keepers, who would be deterred by the bother of a special order, might try this if a suitable package were within easy reach. Besides, it would thus be cheaper.

Supposing we had a suitable package, holding, say, an ounce, selling at 25 cents a dozen (retailing at three cents, or two for five), what would be the advantages of selling honey in this way? It would do away with the surfeit-ing evil. It would give the customer a good taste, and make him want another next time. The adhesiveness of honey would not get a chance to assert itself in the minds of the powers that settle whether honey shall or shall not be consumed, for when once presented in small portions it is pretty sure to be eaten. The dish-washer would not get mad, nor the proprietor grumble at the added labor which side dishes usually impose. It would also put honey in the right shape to be sold to those groceries that locate opposite schoolhouses, and in general would make it a valuable addition to lunches.

By being made square inside, and as wide at the mouth as in the body, the package would also do for comb honey. The bee-keeper, for 30 cents or more a pound net, could well afford to use shallow frames instead of sections, cut up the comb with a square tin jug-cutter, and put the pieces into his paper jars or capsules—certainly much easier to do than to prepare five-cent sections, as was talked of some time ago. This plan would also be the most satisfactory solution of the unfinished-section problem, for the greater portion of the honey (by weight) in such sections is finished, and as good as any to take plugs out of. It would also be a good way to use up all partially defective section honey, thus raising the grade of what remains.

But suppose these inducements did not exist: there is another cogent reason for working up this kind of trade in connection with the ordinary methods. It would be the best kind of advertisement. In this way we could bring

honey to the favorable notice of hundreds of people who otherwise would never wake up to the fact that honey is cheap and enjoyable. Even if the plan did not pay in itself, it would pay in that way. Nor is this an untried theory. In the *Review* I have already written, or will write, of confirmatory evidence, and will repeat it here more in detail. In *L'Apiculteur* for July, 1896, page 278, appeared this paragraph: "The sale of honey in little flasks, for individual portions of 30 to 35 grammes, is increasing. These flasks, for restaurants, are sold for 15 centimes, by the firm of Salmon, 8 Rue de Acacias, Paris. There are also flasks for double individual portions, which contain 60 to 65 grammes, of which the price is 25 centimes. It is a new kind of trade, which aids in spreading the use of honey; it would be a mistake to neglect it." In the *Bienveuer* for November, 1896, appeared this paragraph: "Herr B., in P., formerly lived in a Moravian village, where a disposal of his honey was scarcely to be thought of; the peasants were poor, and strangers and summer guests did not look up the barren region. But the place was the breakfast and dinner station of a railroad. Herr B. made arrangements with the proprietor of the restaurant to place his honey-glasses on the counter for a small recompense. For 10 or 20 kreuzers [5 or 10 cents] the travelers received a little glass of honey and a roll; the glass was wrapped in paper containing brief information about honey, with the address of the producer. The business was a brilliant success; he no longer had to concern himself about disposing of his honey elsewhere, and many of his chance customers became lasting ones."

I am strongly of the opinion that individual portions should be confined to comb honey alone. If once this thing were started with extracted honey, the gates would be opened to the swindlers to crowd in with imitations, and ruin the trade. But with comb honey we are sure of no competition except from other people's pure honey, which is what we want, for the extension of honey-consumption means money in our own pockets in the future. If the customer prefers liquid honey, a slight manipulation with the spoon, which suggests itself to any one, will enable him to secure the greater portion in a liquid form. This is easier done with a small chunk of honey in a special vessel than when it is lying on a plate.

I have not tried this, having no honey to do it with this year; but I am so impressed with the principles involved that I conclude to lay it before the readers of this journal, in the hope that the idea will provoke comment, and, if necessary, criticism. I never did believe in that apicultural pedantry which plumes itself on such sayings as "facts, not fancies," and "cackle when the egg is laid and you have seen

it," forgetting that all business facts were fancies at one time.

It is worth while considering whether it is enough to merely put our honey on the market, and let the commission men and grocers do the rest. They are not interested in it as we are. It is also worth while considering whether it will pay to waste much energy in boosting those uses of honey which are plainly subject to competition from other quarters, such as in cooking and in medicine. Honey in its own field is entirely distinctive and unique, and can have no competition. Though this field is quite limited in comparison with other foods, it is a question whether the general recognition of honey for just what it is would not be equivalent to a demand far greater than the supply. In order to attain this end, it would seem to be desirable to make a study of the underlying principles of honey-consumption, and work accordingly.

Denver, Col.

### COUNTING THE VOTE.

W. D. FRENCH'S REPLY.

*Mr. Editor:*—Referring to comments on page 60 in GLEANINGS, you say: "I shall be very greatly surprised if the proposed scheme for amalgamation carries; and, moreover, one of the men whom he (Newman) has recommended to count the votes, has, in the *Progressive Bee-keeper*, criticised most severely the *American Bee Journal*. Such a person can hardly be impartial. I have nothing against Mr. French. Outside of his very apparent prejudice he would be as good as any man to count the votes and certify the results to the General Manager; but it certainly would have looked very much better, in view of the position that Mr. French will occupy, if he had kept still."

Now, Mr. Editor, I am sure you do not intend to cast insinuations or reflections upon the honesty of this count, or infer from my position as taken in the *Progressive Bee-keeper* that I would not be impartial in counting the votes for the Union. Such a proposition on your part would be wholly conjectural, and without foundation. I never sought the appointment on the returning board, though, inasmuch as it came to me, I shall do my duty properly, without regard to my own convictions, or those of any other member of the Union. Every man has a perfect right to discuss all questions vital to his interests, morally and constitutionally. Though no one need fear the honesty of the count, or sling baseless insinuations into the eyes of the returning board.

National City, Cal., Jan. 28.

[I still think, in view of the position you will occupy, or have occupied, perhaps, by this time, if you had said nothing either pro or con it would have looked better. I am glad you

are not prejudiced, and believe you when you say it. If the result is against my way of thinking, I shall not accuse you or any one else of unfairness. To do otherwise would be equivalent to saying, "If you can't play *my* way I won't play at all.—Ed.]

### LOCKING HORNS.

DOOLITTLE SQUARES UP TO DR. MILLER; COMBS BEING BUILT TO SEPARATORS; CAUSES, AND HOW TO PREVENT.

By G. M. Doolittle.

On page 884 of GLEANINGS for 1896 I find this: "It would be fun to see Dr. Miller and Doolittle lock horns. GLEANINGS will furnish the arena." I have kept away from that "arena" ever since, in hopes that Ernest would ask the good doctor if he had "horns." Should that question be asked Dr. M., I should expect the answer to be, "I don't know." And if Dr. M. don't know whether he has "horns" or not, I suspect he has none, and I don't wish to be in an arena with any one trying to lock horns with him, when he has no horns. Dr. Gallup used to tell how he and a schoolboy mate used to hold the old cat by turns while the other hit him between the eyes to see what effect it would have on the cat; so perhaps it will do no harm for me to hit Dr. Miller a clip between the eyes to see what effect it will have, horns or no horns.

Now, doctor, "right face!" Did you have *many* combs built at their lower edges to the separators when you were using the  $4\frac{1}{4} \times 4\frac{1}{4} \times 2$ -inch sections prior to the time you studied out your "bottom starters"? Tell us; did not the trouble with swinging foundation begin when you reduced those sections to seven or eight to the foot, instead of when you were using six to the foot? If it did not, then you are an exception to the general rule. Now, doctor, we'll give you time enough to turn your gaze toward F. A. Salisbury, on page 17 of GLEANINGS for 1897. Don't you see that, in order to keep the tall sections down to where they will weigh a little less than one pound (so that the grocerymen may be able to buy our product at pound figures, and sell it at section figures), brother S. cut his sections down to  $1\frac{1}{2}$  inches in width, instead of allowing two inches, as is the case of the square section? Yes, you see that. Well, now suppose that Bro. S. had kept his tall sections at 2 inches, and cut his square ones down to  $1\frac{1}{2}$  inches, do you suppose he would be telling us how the foundation in the tall sections was bound to get attached to the separators, while that in the square sections behaved itself like a "little man"? Ah! you begin to see it, do you? Well, suppose he cut those square sections down to  $\frac{3}{4}$  of an inch (about the smallest space in which bees will draw out foundation at all), so that he had only about  $\frac{3}{8}$  of an inch between the foundation on

either side and the separators, how many sections do you suppose he would have that were perfect, without brace-combs? Twenty-five per cent? Now I am ready to admit that, as any (width of) section increases in height, the liability of brace-combs at the bottom increases, where foundation is used, as it would be hard work to keep the foundation true in a two-inch-wide section—if the same were a foot high, in any event; but I *do claim* that the reduction in width of section has more to do with the brace-comb nuisance than all else combined (up to the present time), except not seeing that hives are level, and slip-shod putting in of foundation.

Now, doctor, "right face" again. What is the trouble with you and Salisbury, that your bees are determined to draw out one side of the foundation before they do the other, thus curling it, and this curling causing it to be fastened to the separator? There can be only two things, that I know of, which will cause this. First, too weak colonies to work in the sections to the best advantage, and, second, putting on too much surplus room at once. Is the first the trouble with you? Oh! I see the effect. You're shouting back, "No, sir, 'ee!" Well, I judge you are right in this, generally. But how about the other? Do you not know that the veteran bee-keeper, Mr. Manum, who always produces a fancy article of honey, which sells at top prices, as a rule puts on only from one-fourth to one-half the amount of surplus room at one time that you and Salisbury do? In this way, as soon as the sections are on the hive every section is filled completely with bees; and if any foundation is drawn out the whole is so drawn, and thus the foundation has no chance to curl. Do you see? "Oh, yes!" I hear you say, "that is one of your old hobbies; but there is too much work to that." Will you tell us which is the more work—doing as Manum does, or putting that extra starter in each section? For me I prefer the Manum plan.

Now, doctor, I am going to let you look off again. Just you look at Bro. Pettit, on page 51, GLEANINGS for 1897. Do you see how he runs the bees up, with their loads of honey, on the other side of the sections (from the center) and thus overcomes your difficulty and Salisbury's? Well, what do you think of that? Don't you know that Doolittle, after days and weeks of watching with his one-comb observatory hive, told the world that he never saw *one single bee* go with its load of honey as it came in from the fields, up to the surplus-arrangement, but that all gave their loads to younger bees before any reached as great a height as the middle of the brood-comb? Then you also remember how at a certain point, after you had changed queens, giving an Italian queen in the place of a black one, that you saw only black bees going in and out at the entrance, when

honey was coming in, while a look at the surplus showed very few but Italian bees at work there; this also showing that no field-worker ever deposits its load of nectar in the cells in the surplus-apartment. Yes, you are familiar with that. Well, how do you account for Bro. Pettit's success? What! "don't know"? Suppose we admit that the raising of the hive (as he tells us about), for the time being, retards the bees from entering the sections till the colony gets strong enough, or till some hot wave comes along, then they go in and "possess the land" *en masse*. This puts his bees in the same shape that Manum keeps his, and in just the shape all colonies should be in to build and complete perfect comb honey in sections. If we have, as a multitude of bee-keepers, erred in any one direction, I believe that to have been in the direction of trying to "stretch" our bees out too much, and in this way have received, as pay, imperfect combs of honey, together with thousands of unfinished sections in the fall.

Now, doctor, in letting your crippled, dehorned frame crawl out of that GLEANINGS arena, let me turn your face toward Bro. Ernest Root. What! scent the thing at once? Oh, yes! I see you do! Yes, that's it exactly! When that comb foundation with  $\frac{3}{8}$ -inch side-walls comes out, all of this trouble, worry, fussing, and locking-of-horns-in-the-arena matter will be at an end. Then we can use strips only an inch or two wide, and they will not turn, twist, or be eaten full of holes by the bees, or use tall or square, plump or lean sections; while if we fill the sections full we can secure as much section honey as we now do extracted.

And now as we agree again, or agree to disagree, at the worst, you just say to E. R. R., as you leave the arena, that the price of that  $\frac{3}{8}$ -inch side-wall foundation must not be very much above the square-foot price of the ordinary thin foundation, or the arena will be full of blood and fur, from the many disappointed gladiators who will fight over the price.

Borodino, N. Y.

[From the very beginning we have constantly kept in mind that the new deep-cell-wall foundation should be sold at a price not very much in advance per square foot of the ordinary thin foundation; and while we shall not probably be able to realize that point this year, owing to the great expense in experimenting, in making hydraulic presses, dies, etc., we hope to be able to do it next year. The price of any commodity must not exceed what consumers can afford to pay. If for instance, the new deep-cell foundation costs three or four times as much as the ordinary foundation, beekeepers would not buy it, and consequently it could hardly be called a practical success—see editorials.—Ed.]

REASONS FOR THE TWO-STARTER PLAN; DR. MILLER WHACKS BACK.

So the editor would like "to see Dr. Miller and Doolittle lock horns." Naughty editor! Would like to get two little boys into a fight!

Well, I don't know any fairer man to fight with than Doolittle; and whether he comes off victor or vanquished, he's always good-natured afterward.

It looks a little as if my "Straw" on page 884 was written in reply to the article on page 861; whereas it was written a week or two before I saw page 861. For some reason a good deal has been said lately about the matter of having sections built to separators. Whether my theory is correct or not, the fact remains that formerly I had no little trouble of the kind, and latterly no trouble of the same kind. That is, formerly a section was often built to the separator at the central part of the lower edge of the foundation, and in the few instances that now occur it is at one side, and comes from careless work failing to fasten one end of the starter to the top-bar of the section.

Friend Doolittle says, "The greatest cause for attaching combs to the separators lies in not having the hives stand level." When I read that I said to myself, "Doolittle's off; for a hive would have to be a long way out of level to bring the foundation within  $\frac{3}{8}$  of the separator." Then I went to figuring, and was surprised as well as somewhat humiliated to find that, with sections  $1\frac{1}{8}$  wide on an eight-frame hive, and starters coming down to within  $\frac{1}{4}$  in. of the bottom, one side of the hive would need to be only a little more than 2 in. higher than the other to make the bottom of the starter come within  $\frac{3}{8}$  of the separator. Now, it's easy to say that hives are not likely to be so far out of level as that; but one who has always done his leveling by the eye might be quite surprised on applying the spirit-level to find how far out of true his hives are; and I'm afraid there are a good many hives, especially on a hillside, that have one side nearly or quite two inches higher than the other.

But in my own experience, leveling the hive and obviating all the difficulties Doolittle mentions would still have left 19 cases out of 20 unremedied; for the hives were leveled with a spirit-level, full sheets of foundation were correctly put in, the sections were not put on until the harvest was ready and the colonies were fairly strong, and still the centra' part of the starter was attached at the lower edge to the separator. I think the trouble was that the honey-flow was not sufficiently strong, and perhaps that would come under the head Doolittle gives as putting on sections too early. Still, if I had waited till the trouble was over I would not have put sections on at all; and as it was, I got something of a crop.

The trouble came very much as Doolittle describes it, only, instead of curling at the sides, it was the central part of the lower edge of the foundation that reached the separator, if I remember correctly. The honey came in so slowly that, instead of being put all over, it was put

on the inner surface of the foundation; and the cells on that side being drawn out while the cells on the other side were left untouched, made the starter swing over to one side.

If the starter had been fastened to the bottom, of course it could not have swung over. Nowadays I put in a bottom starter, and the two starters will be fastened together before there's any chance for the swinging, so that proves a sure cure. If Doolittle would use bottom starters I suspect he would gain by it. He says he has so far overcome the trouble that "hardly one section of honey out of 300 is defective along this line." I think that with me not one in 3000 if indeed one in 30,000 is defective "along this line." I don't mean I never have any defective sections. Sometimes the plate of the fastener is carelessly used when too cold, and one end of the foundation drops, or the whole starter falls to the bottom; but the chief difficulty that I formerly had was in the starters being swung over against the separators, and since using bottom starters that difficulty has disappeared.

It's only fair to say that I sometimes have trouble with bottom starters. It is natural that they should tend to fall over, and too often they obey the natural tendency. I think friend Doolittle is right in saying drawn-out comb would be a help; but even then I think I would use bottom starters. It makes a pretty sure thing of having all solidly built to the bottom. But for the bottom starters I'd be willing to pay a big price for foundation with cells well drawn so it could stand up alone.

Now say, Doolittle, I'm willing to own up that, where hives are not level, there may be more trouble than I supposed, although that didn't cause the trouble at all in my case; and if you'll admit that, in my case, the trouble was the poor seasons why, we'll shake hands and be friends again. But, mind you, this does not count the first chance I get to fight you about something else.

#### A FEW WORDS TO MR. DANZENBAKER.

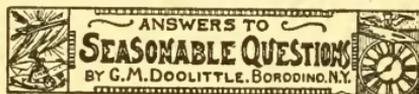

□ On page 891 you mention a Straw which questions whether "bees have to stop to gather and chink in propolis before commencing to store honey in the supers." You urge the importance of warmth, at some length. But, my dear sir, that is not the question at issue at all. I said nothing as to whether it was a good or bad thing to have the supers warm. The question was whether the bees stop to chink in propolis before commencing to store. If your argument has any thing to do with the case, it is that, because it is better to have the supers warm, therefore the bees make them warm before storing in them. But bees don't always do just what we think best, and, moreover, it seems to me it would be very poor reasoning on their part if they should decide to wait until cracks were filled before commencing to store, whereas

they might be storing and gluing at the same time.

Now, friend D., if you want us to believe that the bees hold back from storing till the cracks are filled, please give us some proof other than that it would be a good thing for them. Give us at least one proof that not only ought they to do it, but that they *do* do it. In the mean time I'll go a little further than I did, and give a distinct proof that in at least one case bees did *not* wait to calk before beginning to store. Last summer, colony No. 2 began storing in a super of extracting-combs when there was over their heads a crack 12 in. by  $\frac{1}{2}$  in., and they filled the super without filling the crack. Now you cite a case where they did the gluing before beginning the storing.

Marengo, Ill.

[Neither Mr. Doolittle nor Dr. Miller has seen the other's article, so in the first round they neither "lock horns" nor "hit between the eyes," exactly. What they would do in the next round if given a chance, I can't say; but so far they have very clearly set forth each other's position so that but little more needs to be said. Some will follow the Manum plan and others the two-starter plan.—Ed.]

#### HOW TO SECURE WORKER COMB.

*Question.*—As I have quite a quantity of combs which are only partly built to fill the frames, which I wish the bees to complete next summer, having as little drone comb in them as possible, I wish you would explain a little further in regard to how you work for the building of worker comb, as given on page 891 of GLEANINGS for 1896. You say there, "And by taking them (the combs) out in such a way as to keep the bees desiring only worker brood," etc. What I wish is to understand just how this is done.

*Answer.*—When any colony is so weak that it has no desire to swarm (during or preceding the swarming season or honey-flow), such a colony will invariably build worker comb (so that worker brood may be reared till the colony comes into a prosperous condition), providing they do not have sufficient comb already built. Taking advantage of this fact I use all colonies which are too weak to store honey to advantage, at the beginning of the honey-flow, treating them thus: Their combs are generally all taken from them; but sometimes I leave one comb partially filled with brood, and always one of honey, giving the combs of brood to other colonies so that they will be still stronger for the honey-harvest. I now put in one, two, and sometimes three frames with starters in them, or frames which are partly filled with

comb (as our questioner says his are), just according to the size of the little colony, after I have taken their combs away. In all cases I see that each one has a frame well filled with honey; for should storms or cloudy, windy weather come on at this time they would build no comb of any amount, and might starve; while with the frame of honey they will go right on converting that honey into comb, storm or no storm. If the right number of frames are given to suit the size of the little colony they will fill them quickly, especially when honey is coming in from the fields, and each comb will be filled with brood as fast as built. If not too strong they will generally build comb of the worker size of cell till the brood begins to hatch from the eggs first laid in the newly built combs by the queen; but as soon as many bees hatch they will change to the drone size of cells; or if the little colony is quite strong in bees they may change the size of cells sooner than this. Hence as soon as the first frames I gave them are filled with comb I look to see about how many bees they have; and if they are still well stocked with bees, or are in a shape where I may expect that they may change the size of cell before they reach the bottoms of the frames with worker comb (should I spread those apart which they already have and insert other empty or partially filled frames), I take out the combs they have already built, and thus put them in the same condition they were when I first started. But they will not build combs quite as freely this time as they did before, unless there can be some young bees hatching; so, if I can conveniently, I give them a comb containing mostly honey and a little brood (if they have such a comb it is left with them, which is more often the case than otherwise) from some other colony, when they are ready to work the same as before. In this way a colony can be kept building worker comb all summer, or till the bees are nearly used up from old age, the colony becoming so small as to be unable to build comb to any advantage, under any circumstances. But if just the right amount of brood is left, or given them, so that they stay in about the same condition, they will build worker comb all summer by the apiarist supplying honey or feed when none is coming from the fields. If not so strong but that I think they will still continue to build worker comb, instead of taking the brood away I spread the frames of combs (now built) apart, and insert one or more empty frames between, when these will generally be filled with worker comb before enough young bees hatch for them to change the size of cell. But *this* is always to be kept in mind, whenever you find them building drone comb: The combs they then have, all except the one mostly filled with honey, are to be taken away so that they may feel their need of worker brood again,

when they will build cells of the worker size once more. I have had hundreds of frames built full of worker comb in this way, hundreds completed, as our questioner proposes to do, and hundreds "patched," where I had cut out small pieces of drone comb, which had gotten in in one way or another. If any one wishes a mutilated comb to be fixed so it will be a surprise to him just give it to one of these little colonies and see what nice work they can do at "patching" with *all* worker comb.

#### AN EXPLANATION WANTED.

*Question.*—On page 17, Jan. 1, you speak of the merits of a tall section over a square one; and one of these is, that "they bring from two to three cents per pound more in market." Am I to understand that the "pleasing appearance" of these taller sections causes people to pay that much more for honey in such sections than they would for honey in the square form of section?

*Answer.*—Well, no, not just that, although I think a pleasing appearance often decides the difference in price of from one to three cents a pound on section honey. If you will turn again to page 17 you will see that I did not say that a section  $3\frac{1}{2} \times 5\frac{3}{8} \times 1\frac{1}{2}$  would sell for two to three cents more per pound than would the  $4\frac{1}{4} \times 4\frac{1}{4}$  section; but that "why I prefer them to the *larger* size is that they bring from two to three cents per pound more in the market." What was the larger size spoken of, in that connection? The second line at the beginning of the paragraph will tell the reader. That says "sections varying in size from half a pound to two pounds." This makes it plain that I was not comparing the sections I now use with the  $4\frac{1}{4} \times 4\frac{1}{4}$ , or square section, when I spoke of the price. Now I wish to say that I was opposed to the change from the "prize" or two-pound section to the one-pound or  $4\frac{1}{4} \times 4\frac{1}{4}$  section, and have always claimed that, had bee-keepers held steadily to the prize section, no consumer would ever have demanded any other, and the price for those sections would not have been lower to-day than it now is for pound sections. Bee-keepers made themselves nearly double the work as regards setting up, putting in foundation, scraping off propolis, and handling sections for a given number of pounds, when they pushed the  $4\frac{1}{4} \times 4\frac{1}{4}$  sections to the exclusion of the prize section; and the only reason which I could ever see for this was a desire to compete with one another. But, no matter how it came, it was done. I held on to the prize section as long as it sold in market for as much as the  $4\frac{1}{4} \times 4\frac{1}{4}$  did, less from one to one and one-half cents per pound, for I considered that, taking all things into consideration, the prize section paid as well as the other till a lower price than  $1\frac{1}{2}$  cts. per pound was reached. After that was reached I changed to the pound section, as given on page 17; and be-

cause a difference of two to three cents was reached, that became the reason of my changing, and for my preference for the pound section. As the prize section was a tall section, I still adhered to the tall form when I came to use a pound section.

THOSE HONEY-CARAMELS IN GLEANINGS, PAGE 899.

I made a sample lot of honey-caramels, as you described in GLEANINGS, but I put in granulated sugar instead of the glucose, seasoned with wintergreen. A party here this evening was so taken with it that he is going to get me to make him 100 pounds, and put on a label telling exactly what they are made of. I believe if all bee-keepers take hold of those recipes Dr. Miller is getting up it will, if well worked, be of great value to bee-keepers in general as well as a good pure food. DOUGLAS D. HAMMOND.

Malone, Ia., Jan. 6.

TALL SECTIONS; LAYING THEM ON THE SIDE IN THE SUPER PREFERRED.

I am at a loss to understand why Mr. Doolittle would place oblong sections on end. Of course, you can place more in one super, but we think this a disadvantage for several reasons. One is, we often put these shallow supers on colonies at the beginning of the honey-flow; also on swarms that would object to a larger and deeper super. Again, our experience is that the bees will finish these oblong sections sooner, and, either from retaining the warmth or from their preference for beginning work close to the brood-frames, or both, the bees certainly begin work more readily on these shallow sections. It is an easy matter to examine these shallow sections without removing from super, and they can be readily tiered up to suit the requirements of any colony. We bought our first oblong sections of A. I. Root in Feb., 1893. They were  $3\frac{1}{4}$  inches high and  $5\frac{1}{2}$  long. They overweighed. Since then we had several thousand made  $3\frac{1}{2} \times 5\frac{3}{4}$ , 7 per foot; 21 of these sections cover the same space, about, that 28 of the  $4\frac{1}{4} \times 4\frac{1}{4}$  do. Our grocers prefer them. They make a handy package; and by placing a few of these sections of honey on the counter or in the window tiered up like brick, your lover of honey will hardly pass them without buying.

I wish to say that many of our bee-keepers could dispose of several thousand pounds of their comb honey at towns within driving distance, greatly to their and their brother bee-keepers' advantage. You do not need expensive cases to show in; have your sections and

crates clean. Do not leave the grocer too much at one time. Tell them it is pure, from your own bees; and that when the honey is sold they can pay a certain price for it.

T. S. COMSTOCK.

North Manchester, Ind., Jan. 26.

HOW TO FIGURE INCOME ON 300 COLONIES IN WISCONSIN.

There is one question upon which I should like the expert opinion of some member of your firm; viz.: What would be a fair or medium income from 300 colonies of hybrid and full Italian bees per year if managed by a man of long experience and very considerable skill in bee culture, allowing a reasonable sum for employing competent assistants as need, and provided the bees are in a very fair honey country, and so divided that not more than 75 colonies will forage from the same territory?

Winneconne, Wis., Jan. 7.

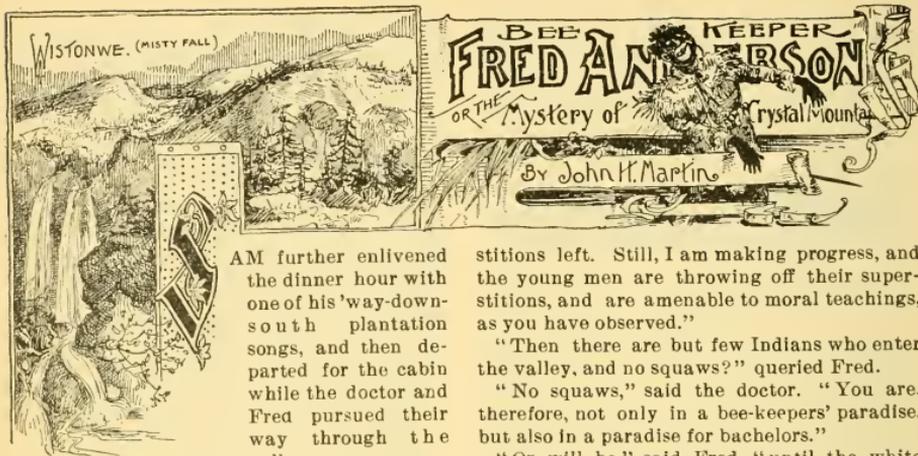

G. R. FRYE.

[This is a very hard question to answer, as so much depends upon conditions, such as the apiarist and the locality. Wisconsin is one of the greatest honey-producing States in the Union; but I doubt not that there are localities in that State that are practically good for nothing, even though not very remote from other localities where plenty of honey is produced. A difference of only ten miles makes all the difference in the world.

In the first place, every thing depends upon the locality and the season. Assuming, then, that the man who is to operate the yards is one of long experience, the locality might yield, on an average, about 40 lbs. of comb and extracted honey. Some years the amount will be about 10 lbs., and others perhaps 75. During the last five years the average would perhaps be nearer 25 than 40. This is speaking generally of the State. Three hundred colonies, with an average of 40 lbs. each, would produce 12,000 lbs. of honey. Suppose that this honey averages 8 cts.; that would mean \$960. If the average proved to be 25 lbs. (which would be safer to figure), the gross amount would be \$675. Before you could get at the amount of your own labor you might have to figure on at least two months of time for a helper—it is possible you might manage without one; then there would be interest on the valuation of 300 hives and appliances, a certain amount for hauling the bees back and forth, carrying of sections, supplies, etc., from one apiary to another, and your own trips to and from each yard. As you could figure better the cost of these items, you could arrive at about the amount you ought to expect under fair conditions.

You will need to figure also that there will be some years when, perhaps, your averages will be only about 10 lbs. per colony, and occasionally a year when you will get absolutely nothing. Perhaps there will come a year when the balance will be clean the other way—when you will have to feed perhaps 10 or 15 lbs. of syrup per colony.

I have put the average price of honey at 8 cts. If you produce an equal amount of each, this will be figured 10 cts. for the comb and 6 cts. for the extracted, both first quality. Perhaps some bee-keeper from your State can give us a set of figures that will give us an idea of the expenses we need to figure in; but from this standpoint I can hardly give you any thing more definite than the above.—ED.]

AM further enlightened the dinner hour with one of his 'way-down-south plantation songs, and then departed for the cabin while the doctor and Fred pursued their way through the valley.

"I think," said the doctor, "that I will not show you my apiary until we return from the sulphur springs. I will show you the field first, and its possibilities, and the apiary last."

"Suit yourself as to that," replied Fred; "every thing is interesting so far. I take it that the apiary is on the terrace above us, from the way bees fly over; and then I thought I caught a glimpse of it from that lofty observatory. They followed down the stream;" and Fred, addressing the doctor, said, "I supposed you had quite a number of Indians in here; but I have seen none thus far."

"There are only a few that come in here," replied the doctor, "and then only upon some religious rite, or when I need extra help. This is a sacred valley to them, and they have about as strange a tradition as Sam has related about Ham's change of hue. I have related to you some of their traditions; but the one that has much to do with their rites in this valley is that their tribe sprang from a gopher snake. A white squaw in splendid white raiment changed the snake into an Indian, and at the same time changed a rattlesnake into a squaw. Now, according to their tradition this same white squaw will reappear and change them back into snakes, and confine them ever after in this valley."

"But, doctor, the bees having usurped the place of the snake I should think you could work them out of that absurd idea."

"I am working to that end," replied the doctor, "but as yet nothing has usurped the rattlesnake; and standing as it does for the squaw I much doubt if any thing ever will, for you must know of the contrariety of squaws generally; furthermore, my young friend, little do you understand the vagaries of human nature. It has taken Christendom ages to throw off rank superstitions, and still after these hundreds of years I fear there are too many super-

stitutions left. Still, I am making progress, and the young men are throwing off their superstitions, and are amenable to moral teachings, as you have observed."

"Then there are but few Indians who enter the valley, and no squaws?" queried Fred.

"No squaws," said the doctor. "You are, therefore, not only in a bee-keepers' paradise, but also in a paradise for bachelors."

"Or will be," said Fred, "until the white squaw arrives and overturns things."

"Yes," growled the doctor, "that is just what always happens when the squaws arrive. But, Fred, we have something more profitable to talk about than traditions and squaws, and I am very glad to have you here to talk with. For the past eight years I have had but little communication with my kind and the outside world, and it is a new phase of my life to have a kindred soul here with me to commune with. But to leave our reflections, and to get down to practical things, we are in the center of the valley, and here are the hot sulphur springs."

"Do you know, doctor, this is a great curiosity to me? I have read much of such phenomenal things in this country, and these are the first hot springs I have had the pleasure of seeing—many of them," said Fred, in admiration, "and all along the base and sides of this cliff, steaming hot too."

"Yes, boiling hot," said the doctor, "and I wish to show you my improvement. When I came into the valley, and until recently, the cold water from the upper end of the valley and this copious stream of hot water united at this point, and flowed to the outlet together. But now you observe that I run the cold water into that ditch over there. Now let me demonstrate to you the reason why. You observe that the old channel is full of that obsidian formation that surrounds the valley. This boiling-hot water running over that formation raises it to a high temperature, as you will readily feel if you try to pick up one of those stones."

"Jerusha!" said Fred, as he attempted to hold a piece of the hot obsidian in his hand, but quickly threw it down, and, blowing his fingers, exclaimed, "That is hot."

"With these simple flumes I can turn the hot water into the cold-water channel. Now, when I turn the cold water upon those hot stones,

see what an amount of steam arises; and if we stand here long enough there will be a line of vapor clear to the outlet. When the steam ceases to rise I turn off the cold water, and the hot water on, and heat the stones again, and *vice versa*, as long as I please."

"I plainly see how it works," said Fred; "it is very interesting; but does it pay to sit here and do that for fun all day?"

"Fun!" said the doctor, with a tinge of impatience in the tone. Then he laughed, and said, "Well, that certainly does look like a funny operation, for the sun soon dispels the steam. But let me tell you, my friend, when the atmosphere is just right, and I do this in the evening, I can fill this whole valley with a heavy fog. Now do you see any utility in that?"

"I see," said Fred; "for in the morning, after a heavy fog, the bees do a roustabout

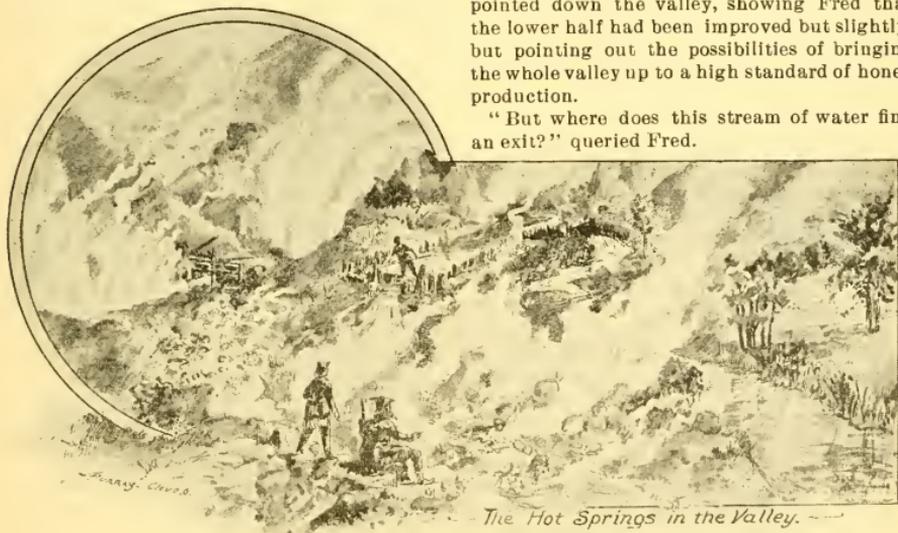

"In that case then," said the doctor, laughing, "you might provide yourself with mallets, and go out on a tour of jarring the trees. But really the lightning is the factor. Every flash liberates quantities of ozone; and where ozone is abundant, there is a plentiful secretion of honey. I am now studying upon a plan by which, in connection with the fog, I can ozonize this whole valley. If I succeed we can astonish the natives with our honey-yields."

"Well, that would be a wonderful thing, doctor, to astonish these natives who are so stoical about every thing. But, really, your plans are too deep for me. I am not educated on the scientific side of bee culture."

"Of all places in the world, in this valley is just the place to learn the highest science in bee culture."

Stepping up a little rise of ground the doctor pointed down the valley, showing Fred that the lower half had been improved but slightly, but pointing out the possibilities of bringing the whole valley up to a high standard of honey production.

"But where does this stream of water find an exit?" queried Fred.

*The Hot Springs in the Valley.*

business; for, generally, fogs have an effect upon the more rapid secretion of nectar."

"Precisely so," said the doctor, "and especially hot fogs such as we have in this valley. Now, what do you consider the very best atmospheric conditions for the secretion of nectar in the blossom?"

"I can speak only from my eastern experience," replied Fred; "and I find that, away down in Maine, a hot July day, wherein we have several short sharp thunder-showers, the flowers seem to overrun with nectar, and the bees do a roaring business."

"And why?" asked the doctor.

"I really don't know," replied Fred; "but I have had a sort of vague idea that the thunder sort o' jolted the honey out of the tree or plant into the blossom."

"Oh! it plunges into a jagged cave at the extreme end," replied the doctor. "We will now return and visit the apiary. It is well up on the third terrace, and we will follow this zigzag trail to the upper terrace, where we find a fine view of the valley."

As they climbed, the doctor called attention to the charming little waterfall near the entrance. The Indian name was *Wis-ton-we*, or *Misty Fall*.

"When we go up there again you must examine my scientific home-made elevator, a rawhide rope, a large rawhide water-bucket, and other original fixtures. But here we are. This gives a better view of the whole valley than we get from any other point."

The *Wis-ton-we*, after a plunge of 50 feet, collected itself into a little stream that, from

their point of view, looked like a silver cord winding in and through the shadows of trees and shrubs. Now and then could be seen oval ponds glistening in the sun like beads upon the cord; clusters of live-oaks snuggling close together like consulting friends; tall prim gum-trees in regular order like sentinels upon the outposts; willows, their long pendent branches toying in the pools; climbing roses and flowering vines hiding rocks, or pendent from the cliffs, their many-hued blossoms lighting up each crag with a glory of color, and filling the air with fragrance; and the effect of all was simply enchanting.

"Doctor, I am charmed," said Fred, with enthusiasm, as he looked down upon the beauty below and around them. "I never thought that a place on earth could be made so beautiful."

"Neither could it," replied the doctor, "except in this glorious California."

"But, doctor," said Fred, with an eye to practical results, "if you would throw this valley open to the public it would bring you a revenue equal to a gold-mine."

"Gold! gold!" said the doctor, with much feeling; "is there no place on this broad earth where man may seek a home, and rest from the gnawing, sordid greed for gold? Is there nothing higher, nobler, in this life than to grasp, grasp, and hoard a paltry bauble that for a day brings pleasure, and for eternity leaves a sting? Gold! that cause of ceaseless strife wrecks nations, divides our race, rends families, debauches the church—away with it! let this valley, with its crystal water and untainted air, be free from it; and, though we eat but a crust, let it be with contentment, and great gain to body and soul. But I do not blame you, Fred, for looking upon the money value of this valley. You are young, and come of a thrifty race of people who have carved out meager fortunes on the sterile hills of the far East, and to you this probably looks like a waste of opportunity; but when the gray hairs peep in profusion from under your hat-brim you will or should have a different view of such things."

"Well, doctor, this is your paradise, and you seem to have entire control of it, and I know it would mar its peace and quiet, and perhaps prevent many of your experiments if the public were allowed to enter; and, though I know the evils of the worship of gold are many, I also know that gold properly used brings with it countless blessings, and I am sure you could use it as such. But even if you do not let the public in, when I look over the valley I sadly miss two very important elements—so important that the beauty is marred without them."

"Now, Fred, I am curious to know what your two elements are. To me this valley is

near perfection. If gold will plant your lacking elements, it will be forthcoming."

"Yes, you have it, doctor, near perfection; and to add the last touches needs neither silver nor gold, but love. It lacks lovely woman and romping children. In my far eastern home I have a loving mother; and, aside from the home loves, the neighboring children were my best friends. Doctor, let me sing you my love-song;" and for the first time in many weeks Fred sang:

I love it, I love it, the laugh of a child,  
Now rippling and gentle, now merry and wild;  
Ringing out on the air, with innocent glee,  
The merriest sound in the world for me.  
Oh! the laugh of a child, so wild and so free,  
Is the merriest sound in the world for me.

Memories that had lain dormant in the doctor's breast for years were touched. He brushed a tear from his eye, but brusquely remarked, "Fred, you are too sentimental. For a change of subject let us look at our apiary;" and he led the way down the terrace.

Fred Anderson, the enthusiastic bee-keeper, now forgot his other surroundings, and began to speculate upon the wonderful apiary he should see. The doctor had exploited the wonders of the valley for honey production so highly and learnedly, of course the apiary would be upon the same scale. They descended to a little amphitheater that sat back from the terrace proper, and covering, perhaps, an acre of space—an ideal location for an apiary. On the far side of it, against an odorous bank of heliotropes, were ranged ten colonies of bees in rough hives made of old gasoline-cases.

"For heaven's sake, doctor," exclaimed Fred in astonishment, and a tinge of anger in the tone, "those are not all the bees you have in the valley?"

"That is certainly all," said the doctor; "but, even were there fewer, Fred Anderson, what are you going to do about it?"

#### WARNINGS TO BEE-KEEPERS, IN BEE-SUPPLY CATALOGS.

ALTHOUGH the bee-journals have cautioned their readers over and over again not to ship their honey to new and untried firms, it is evident that many bee-keepers, notwithstanding, are doing it right along, and are suffering the consequences. The probabilities are that they do not take *any* bee-journal. Perhaps they think they can not afford it. After they have lost several hundred dollars through an irresponsible or dishonest commission house, *perhaps* they will begin to think they *can* afford

it. Only \$1.00 a year invested in a bee-journal will save several times that amount in valuable kinks learned during the year, and will enable them to fight shy of the rascals engaged in the business of selling honey.

Realizing that the patronage of the journals is comparatively small, we have this year put a paragraph in our catalog, that reaches a circulation of 150,000 a year, warning our patrons to beware of new and untried commission houses. Usually, firms promising to do extraordinarily big things are the very essence of rascality, and the more aggravating because they are sharp enough to evade the law. Well, it would not be a bad idea if dealers and manufacturers would advise their patrons in a similar way in their catalogs. Let us leave no stone unturned to post bee-keepers on the ways of these "snide" concerns.

#### THE NEW HONEY-LEAFLET BY DR. MILLER.

OUR honey-leaflets are now out, and are entitled, "Food Value of Honey." The subject-matter was prepared by Dr. C. C. Miller. I gave him the general outlines of what I wanted, and told him to work the subject over thoroughly, in a way to interest consumers; and this he has done in a most admirable manner. The following headings appear through the leaflet: Honey as a wholesome Food; Honey the most delicious Sauce; It is economy to use Honey; Give Children Honey; Honey the best sweetening for hot Drinks; Comb and Extracted Honey; Different Kinds and Flavors of Honey; Adulteration of Honey; Care of Honey; The various uses of Honey; Honey-cooking Recipes. These last have been carefully tested in the homes of bee-keepers. Some of the recipes heretofore published make "messes" that are simply vile. The doctor has carefully selected only those that are good, many of them having been tested in his own family. Among these is the recipe for the celebrated honey-jumbles. The others comprised various recipes for making honey-cakes, honey-gems, honey cough-cure, summer honey drinks, etc.

Taking it all in all, I believe this leaflet is the most comprehensive and most complete of any thing that has ever been gotten out; and it will do a world of good in stimulating trade in pure honey, providing bee-keepers make an effort to place it among their customers. In fact, we are preparing to distribute it all over our town of 2000 inhabitants.

We put the price so low—just high enough to barely cover cost—so there will be no reason why bee-keepers can not scatter it far and wide. Price: 10 for 5 cts.; 100, 20 cts.; 250, 40 cts.; 500, 75 cts., all postpaid; lots of 1000, 75 cts., postage or express *extra*. The leaflet contains something like 3000 words. It is printed in bold, clear-faced type, leaded brevier, like our A B C book, and the matter occupies four

pages the size of this. When desired to inclose it in a letter, all that is necessary is to fold it twice as you would a letter.

I will further make the suggestion that every honey-producer in the country, every time he writes to his customers, inclose one of these leaflets. The price is so extremely low that he can well afford to do it. If the demand shall prove to be great enough, we shall be able to reduce the price still further. As it is, we expect an enormously large demand or else we could not make these prices, for we do not care to make any direct profit on the leaflet.

HONOR TO WHOM HONOR IS DUE, AND CREDIT TO WHOM CREDIT IS DUE; WHO FIRST USED STAPLES UNDER THE PROJECTION OF TOP-BARS, AS END SPACERS?

SINCE our last issue, describing the improvements on Hoffman frames, as given on page 94, we have received scores of indorsements and orders. I do not know of any thing we ever introduced that seemed to have been so instantly accepted as a move in the right direction as the end-spacer to the Hoffman frame. Among those who consider the improvement of great value are two or three who used the idea long before we did. Mr. F. Boomhower, of Gallupville, N. Y., a bee-keeper who has figured more or less prominently in the bee-journals for perhaps a score of years, says he has used end-spacers for years, as we have described them, including the wooden gauge and all. In proof of this he furnishes one of his catalogs, issued in 1893. In this he sets forth the great desirability of the improvement. A few quotations will suffice to show how much he valued the idea. He says: "Any one can, for about 2 cts. per hive, add this improvement to his frames which he may already have in use, without changing or getting new ones;" that they "add much to the enjoyment of the operator, and make rapid manipulation a pleasure. . . Any frame or frames can be instantly removed, and at all times, without the use of any knife or pry to remove them, as is the case with the Hoffman or any closed end frame. There being a bee-space between the end of top-bar of frame and shoulder of rabbet, in end of hive, there is no possible chance for the bees to apply or deposit any propolis; and any or part or all of the frames can be instantly shoved across from one side to the other. . . This arrangement alone is a valuable one, and merits the attention of every progressive bee-keeper."

The frame that Mr. Boomhower describes, as will appear from the disparaging reference to the Hoffman, as above given, was *not* exactly such a frame as we illustrated in GLEANINGS. I have before me one of his hives and a set of the frames. The top-bar is a bee-space short at each end, and a nail driven in diagonally through the top into the end-bar. These end-

bars are narrow, and staples are used as *side-spacers*.

However, Mr. A. G. Willows, of St. Catharines, Ont., says he used exactly such a frame as was described on page 94 in last issue, in the summer of 1893, and that he wrote to us at that time (we had forgotten it) calling our attention to them, but that we replied that we could not see our way clear to change the length of the top-bar, or something to that effect.

Both Mr. Boomhower and Mr. Willows very properly felt that they ought to have the credit for being prior in the use of a bee-space around the top-bars in connection with a staple end-spacer. Both seem to be entirely ignorant of what the other has done.

Now, if the reader will turn to my article on page 94 of our last issue he will see that I did not claim the idea was *new*. I simply carried the impression, which was true, that the improvement was something new to our *catalog*. In other words, we introduced the improvement as a new one to our customers, just as we introduced the Hoffman frame in 1890—a device that had been used for 15 years or more prior to our adoption of it. As I shall presently show, neither Mr. Boomhower nor Mr. Willows is prior in the use of the bee-space around the top-bar in connection with staples. A. I. R. says Langstroth was the first one to make and use it; that he bought frames of this description of Ransom & Cobb, of Cleveland—a firm who made the Langstroth hives away back in 1864 and '5. In proof that Mr. Langstroth did use this very thing, the reader is referred to "Langstroth on the Honey-bee," 1857. Plates 1, 16, and 22 show the bee-space around the ends of the top-bars. It is true, the staples are not shown; but A. I. R. says they are mentioned and their use discussed in the old volumes of the *American Bee Journal*, and were used by him and quite a number of other bee-keepers who were then following Langstroth.

1857! Well, well! How many times we think we have invented something, only to find that Langstroth was ahead of us by about thirty years!

But I do not care how old an idea is. If it is a good one, use it; and if not, throw it away.

Unless Mr. Boomhower used staples under the projections of the *Hoffman* frames pure and simple, Mr. Willows will have to have, for the present, at least, the credit of being prior to any in the use of staple end-spacers when applied to *Hoffman* frames. With regard to staples or nails as side-spacers, E. France & Son used them a great many years ago—just how long I can not say. □ The idea is certainly very old. I find in GLEANINGS for 1890, page 99, and 1891, page 474, spacers of this description. In the *American Bee Journal* for 1871, page 252, will found that Henry Alley used

staples as side-spacers. Again, in the same journal it seems that Mr. Thomas used side-spacers to Langstroth frames. A reference to it is given on page 203 for 1870. British bee-keepers have for years used a bee-space around the ends of the top-bars, in connection with a shoulder or end-spacer, to butt up against the hive-rabbit under the top-bar. See Cheshire and the files of the *British Bee Journal*. A single reference from this journal will suffice; viz., Jan. 1, 1876, page 169. Again, Mr. A. B. Weed (brother of the foundation man) used short top-bar projections with nails under them some 15 years ago.

In justice to Mr. Boomhower, perhaps it would be fair to state that he may have been, and probably was, the first to make use of staples as *both* side and end spacers. His arrangement will make a very excellent self-spacing frame, and I will illustrate it in an early issue of GLEANINGS. But taking it all in all, I should prefer the Hoffman as illustrated in our last issue, for the reason that I *want* the wide part of the end to help conserve the heat, and also because the sticking together of these contiguous parts of the frame is a decided advantage rather than a disadvantage. I *want* the frames to stick together some. It is much easier to handle them thus in pairs and trios than to try to hold them together by mere friction; and then in carrying the hives about, this slight sticking prevents the frames from slipping about. Still, there may be some who would prefer the Boomhower plan. All that would be necessary would be a few extra staples applied to our regular thick top frames having end-bars  $\frac{7}{8}$  wide. We can furnish hives for this combination at the same price as our regular ones; but the hives will have to be ordered from the factory rather than from any of our branches or agencies, as we shall not regularly keep them in stock.

#### FOUNDATION WITH DEEP CELLS; MR. HUTCHINSON'S "NOTE OF WARNING."

COMMENTING on what was said on this subject, both in the *American Bee Journal* and in GLEANINGS, Mr. Hutchinson, in the February Review, feels "that a most earnest warning ought to be given regarding the use of such foundation." Well, perhaps I had better give all he says, and here it is:

We all know that the eating quality of comb honey has not been *improved* by the use of comb foundation—much has been the complaint about the "fish-bone" in comb honey. Comb, natural comb, is of a light friable nature—like the feathery, new-fallen snow. Once this snow has been *melted* it can never be restored to its former state. It may be frozen again, but it will be hard and solid; it will be ice. Of course, Nature can evaporate the water, and form it into snow again, but man can not restore it to snow. In a like manner, once comb has been melted into wax its character is changed. It is no longer comb, but *wax*. Another simile has been used by Mr. Bingham; viz., that "butter is butter, but melted butter is grease; so comb is comb, but melted comb is *wax*." Comb foundation

of the highest, most fragile type is bad enough; foundation walls one-half inch deep will be an *abomination*. Unless I am greatly mistaken it will be as great a blow to the sale of comb honey as has adulteration to the extracted-honey market. At least, let us try this thing most *cautiously*. I fear, too, that unscrupulous men would use this product even if it did injure comb honey. Let us be careful what we do in this line.

I would not assert that artificial comb could not be made having walls as thin as those of natural comb, but they would still be of *war*; and comb honey having such a product as its base would be little else than honey "done up" in a tough, leathery, "gobby" wax—not comb honey with its delicious, fragile, toothsome, flaky comb.

I believe that Mr. Hutchinson is thoroughly honest in his convictions on this matter. In fact, I once thought as he does; but Mr. Weed knocked my theories into smithereens by hard facts in the apiary.

He had been experimenting and testing this new product for *nearly two years* before we said any thing about it in print. He has put it on our hives, and had the bees draw it out—in fact, tried it under all sorts of conditions. The proof of the pudding is in the eating; and the results in our apiary so far seem to show that Mr. Hutchinson's fears are groundless. The *comb* from the new product is *not* tough and leathery at all. After a long series of experiments\* we have about come to the conclusion that, in the use of foundation, the bees do not utilize or in any way make use of the wax in the *base* or *septum*; but they will utilize all the wax in the *side walls* to the depth of  $\frac{3}{8}$  inch. Ordinary roller-mill foundation has a surplus of wax in the wrong place. We are aiming in the new product to put it in the *right place*. With this end in view, Mr. Weed has been experimenting along the line of making deep-cell foundation, the bases of which are just as thin as the natural; and the walls, instead of  $\frac{3}{1000}$  inch thick, as in the natural, are  $\frac{3}{1000}$ . Careful measurements last year showed that the bees reduced this  $\frac{3}{1000}$  down to about  $\frac{3}{1000}$ . The surplus wax was simply used to build up the depth of the cells.

I grant that there is fishbone to some extent, resulting from the use of comb foundation; but the reason of this is that at present there is more wax in the bases than there needs to be; and the wax in the side walls is in such shape that the bees do not utilize all of it. The result is that a midrib is left in the center of the comb, thicker than will be found in combs built wholly by the bees. In the new product we propose to put this wax where it will not be detected in the eating. The very snag, then, that Mr. Hutchinson is afraid we shall run into is the *very* one we would avoid in the new product. In other words, it is not proposed to use more wax than we now use in thin foundation; but we do aim to put that wax in such shape that bees will utilize it in such a way as to leave no midrib or fishbone in comb honey.

\*Mr. Taylor's observations as given in the *Review* are quite in line with our own experience.

Mr. Hutchinson need have no fears that we shall rush on the market the new deep-cell foundation in any quantity this season. At present we have only one small machine, and turn out pieces about 4x5 inches. We are working on another machine to make samples perhaps 5x8 inches. The machinery and dies necessary for the purpose are very expensive, and, even with the larger machines, the output will be very limited. If bee-keepers are holding back their orders for foundation, expecting the new product in *quantity* this season, they will be disappointed. They had better make their requirements, irrespective of the new article, and in the mean time we will try to furnish a super or two of the new deep-cell foundation to those who wish to try it.

After reading the above, Mr. Weed added:

It seems to me that Mr. Hutchinson ought to have put his "Earnest Warning" at the head of Mr. Baldrige's article in the *same issue*. Mr. B. "prefers light brood to thin foundation for drawn combs," or, in other words, proposes to use much more wax than I do. Would not Mr. Baldrige's "abomination" be still more of a temptation to "unscrupulous men"?

#### APICULTURAL INVENTIONS AND THEIR DEVELOPMENT.

At the Michigan State Bee-keepers' convention, reported in the *American Bee Journal*, Mr. T. F. Bingham, of smoker fame, in his paper on principles in apiculture, closes up thus:

In counting up the inventions pertaining to bee-keeping, which have been long tested, weighed in the balance and not found wanting—inventions which no one has been able to improve or improve upon—I find no other State has made so many valuable inventions since the invention of the hanging movable-comb frame by the Rev. L. L. Langstroth, as has Michigan.

This may or may not be true; but one thing I believe is true—that Ohio has done more to develop and put into practical use inventions and improvements in apiculture than any other State in the Union. Before our Mr. A. I. Root began the sale of supplies, very little had been done in the way of developing inventions of merit. I do not think it is egotistical to say that he *pushed into* public favor the honey-extractor, comb foundation, section honey-boxes, and did, perhaps, more than any other man to make Langstroth dimensions standard. In later times we have popularized self-spacing frames; improved the construction of hive-corners and hive-covers; bettered the quality of foundation; and now we are introducing the new drawn or deep cell-wall foundation.

#### AMALGAMATION DEFEATED.

JUST as we go to press, the certified report of the judges of election for the National Bee-keepers Union has come to hand, showing that amalgamation is defeated two to one, and all the old officers reelected, including General Manager Newman. In view of the reasons stated on page 60, the result is no surprise. GLEANINGS bows to the will of the majority. No room to squeeze in more this time.

## OUR HOMES.

He that soweth to his flesh shall of the flesh reap corruption; but he that soweth to the Spirit shall of the Spirit reap life everlasting.—GAL. 6:8.

Camp Verde is about thirty miles from Jerome, and about fifty miles from Flagstaff. These are the nearest cities or towns of any account. Camp Verde itself used to be a military station with a fort or camp as a protection from hostile tribes of Indians. The Indians, however, have long since ceased hostilities, and the camp is broken up. All that remains is the long low adobe buildings, a single store, and one or two dwellings. It was Saturday night when I got into the Verde River. During the evening some of the neighbors dropped in, and finally a young minister who was to preach to us on the morrow. He was a bright, vivacious, muscular young Irishman, or at least he came from Ireland. During his early life, he, in the language of our text, did considerable in the way of sowing to the flesh. Through the grace of God he was converted, however, and is now giving all his strength, life, and zeal toward sowing to the Spirit. I shall long remember that pleasant evening at friend Bell's. We kept the minister talking, and answering questions until he would have been tired out had it not been for his Irish muscle and the grace of God that seemed to make him untiring in his work. He preaches at three and perhaps four different stations, scattered a good many miles apart. Most of his appointments are every other Sunday; some of them only every third Sunday, and, if I remember correctly, at some points they have preaching only once a month. At most of these country places, however, they have Sunday-schools and Endeavor meetings every Sunday. I believe these are both generally well attended. But there is a general complaint of poverty all over this locality. The minister is paid partly by the church that sends him out, and he is expected to get a part of it from the people where he preaches. Mr. Bell informed me, however, that they were very much behind in raising their small proportion. Rev. Mr. Healy has never lost courage and zeal, however, even if his people are a little behind in paying his salary. He is one of the most untiring and indefatigable Christian workers I ever knew.

After giving us an excellent sermon at the schoolhouse he hastened off to another appointment several miles up the river. He preached and exhorted there as usual; and as we were coming home from the Endeavor meeting in the evening we passed a little home where I happened to know there was quite a family of children. I stopped a moment to listen to the very earnest talking from some one inside, and looked inquiringly at Mr. Bell.

"Oh!" replied he, "that is only our minister. As soon as he gets through preaching he makes house-to-house visits, calling on those who do go to church and on those who do not go, all alike. In fact, he puts in pretty much all his time week days and Sundays in visiting the people of his different parishes."

There were so many of us in friend Bell's pretty little home that Saturday night that we were asked, the minister and I, if we could manage to occupy the same bed. I do not know just what I said, but I felt like saying, "To be sure, we can. So far as I am concerned, brother Healy and I can not only get along in the same bed together, but we could get along side by side through all life's journey, clasping hands as comrades in the Master's service."

Oh how much good it does me to find strong,

earnest, bright young men, giving their whole lives toward battling for the right, and holding up before the world the cross of Christ!

I am now going to "tell stories out of school" just to illustrate what Christianity has to meet in these out-of-the-way places. Of course, there are boys and girls to be looked after, even if the homes are scattered more or less apart; and these boys and girls will get together and have some sort of frolic now and then. Perhaps one reason why the Endeavor Society has made such headway is because it affords the means of letting young people get out and see each other. Through brother Bell's instrumentality, together with that of his good wife, they have quite a good Sunday-school and Endeavor Society in their neighborhood. Yes, there are two or three of them — one at the old camp and one up the river near the locality where brother Bell and I had our "falling out." Well, some time last fall, I do not know but it was toward Thanksgiving time, the Endeavor Society decided to have a "husking bee." Quite likely, husking-bees had been fashionable before any Endeavor Society was started. When the Endeavorers took the husking-bee in charge, it was understood — at least by the Christian people — that it would be something in line with the Endeavor socials. I believe the husking-bee was a success. But after it was over, some of the young people, in accordance with a time-honored custom, commenced to clear away the chairs and tables, so as to wind up with a dance. The Endeavorers protested, and finally managed to wind up the husking-bee at a seasonable hour, without any dance. A certain element, however (but I am not prepared to say whether they were members of the Endeavor Society or not), were very much put out, and declared they would "pay" the Endeavorers off, and "get even" with them. Please bear in mind what I have said about the difficulty of paying the minister's salary. As a rule, the crops are poor in the Verde Valley; and not only do the people work hard for whatever they get, but all their produce must be hauled over long mountain roads from thirty to fifty miles before they can find a market. Under the circumstances it seems hard to call upon these poor hard-working people for contributions for *any* purpose. They have no money, and absolutely "can not" raise it. May be you have heard of such a state of affairs before. Perhaps it is talked and felt in your own community. Now just wait a bit. The opposition side to the Endeavorers declared that, even if they *were* defeated on a Thanksgiving dance, they would not be on a Christmas dance; and they made their preparations, and advertised tickets for sale at a dollar each, and then they went to work to carry out their project. By some hook or crook, the superintendent of the Sunday-school — or one of the Sunday-schools at least — was induced to help sell tickets; and, what do you think? They made their boast that they were going to sell a hundred tickets, and did sell that many. One hundred hard-earned dollars were taken from the poor people of that valley, and paid over for tickets to the dance; and then they crowded over the Christian element who thought at Thanksgiving time that spiritual things had triumphed over the enemy.

Dear friends, perhaps I have not told the story just right. It is near enough right, however, I think, to illustrate the point I wish to make. In almost any community people can scrape up money if it is wanted *badly* enough. Very likely, as a consequence the minister's salary is cut off; perhaps rents were not paid; may be the good wife and the children had to go without suitable clothing to get ready for

church and Sunday-school, in consequence of the money that was raised for that dance. May be the Christian people did not take just the right course at the time of the husking-bee. It is a little dangerous to shut right square down on things of this kind in a way that is liable to bring up bitter feeling and divide the people into opposite factions. If some of the good women had plead with those who wanted to have the dance to have it at some other time, and if the dancing-party had consented, it would have been very much better.

Do some of you inquire what harm the dance would have done the Endeavorers? Perhaps I am not equal to the task of answering this matter right here, even if it were advisable to take the space to do so. I may say, however, that, where the thing has been tried, it has been shown very conclusively that the more young people are interested in dances, the less they are interested in spiritual work. The young people's prayer-meeting can not be made to harmonize with a dance. One or the other will have to go to the wall. If the boys and girls would dance only with their *brothers* and *sisters* it would be a different thing. But they will not do this. They themselves will tell you there is no "fun" in it. I once suggested to a man who was going to walk a tight rope that he should stretch the rope only six feet from the ground. The people all laughed at me. Nobody would throw any money into his hat if he walked on a rope only six feet from the ground. It must be away up above the tops of the highest buildings if possible. They would not pay their money unless he would stretch a rope so high it would be *sure death* if he should fall. Now, you may think I greatly exaggerate when I say the matter of dances is something on the same line. People would not pay a dollar to go to a dance unless they were permitted to incur danger. The danger is not so much to young men and boys as it is to young *girls*. It is the latter class who are going to be crushed to a shapeless mass of deformity if they fall.

Oh, yes! I *do* know that boys and girls who refuse to dance or to play cards are, in many places, ostracized, as it were, from the rest of the young people. I do know of the hits and stabs they get when they decline. God knows I know of the crosses they have to bear in order that they may make their lives pure and clean. I have not spoken of fashionable wine-drinking; but these three seem to go together. May God help us to stem the tide. May he give grace and courage to the young people and to the young Christians who are nobly and heroically holding the fort. Oh how it rejoices my heart when I see a young man or young woman who has gone safely through the ordeal of the teens! for it is true, dear friends, that, almost without exception, a boy or girl who gets to be 20 or 25 will begin to lose the inclination for such things. Again and again have I heard such ones say, "Oh I am so glad that I held fast to the advice of my father and mother in regard to these matters! I can see it now, but I did not then." Dear young friend, you can easily test this matter of "questionable amusements" for yourself. If you are a professing Christian or a member of the Endeavor Society, suppose you try the experiment of joining in with those who take part in such amusements, and watch carefully to see what effect it has on your spirituality. After having attended the dance, can you read your Bible or kneel in prayer, or take part in the Endeavor Society, with the same zeal and enjoyment you did before? I think there can be but one decision in regard to this matter. There may be private dances in the home circle, among friends and

relatives, where there is but little to be objected to; but as you acquire skill in the exercise you will be constantly called upon to mix in more or less with the great outside world. I have watched the matter for almost fifty years, and my decision is like that of your own pastor and that of almost all good Christian people. A very dear friend of mine with whom I had had frequent conversations on this matter once came to me and said her conscience prompted her, in view of the talk we had had in regard to dancing, to make me a little confession. This confession was something like this:

"Mr. Root, after every dance that I have attended I have always had a feeling next morning that I was a little lower down than I had been the day before. Nobody told me so, but it was the verdict of my own conscience. Now, you know I sometimes go to prayer-meeting, and take part; but every morning after having attended the young people's prayer meeting, especially after having taken part, somehow I feel just the opposite. In fact, I feel as if I had been lifted up just a little. The verdict of my own conscience is that I stand a little *nearer God* and a little further away from earth and earthly things."

This was not her own language exactly, but it was the purport of it as nearly as I can remember. Now, if God's Holy Spirit gives us all this sort of witness, we do not need to go to others for advice. We do not need to inquire what *others* do in regard to these matters; but we may seek the same counsel that my young friend did. We have it in the little text at the head of my talk to-day:

He that soweth to his flesh shall of the flesh reap corruption; but he that soweth to the Spirit shall of the Spirit reap life everlasting.

Please remember those beautiful words at the close—"shall reap life everlasting." Of course, we must bear burdens. Sometimes it seems pretty hard for the average boy or girl; but, my dear young friends, let me suggest to you that the great time of seed-sowing is while you are in the teens. About the time you are 20 or 25 you will begin to reap. Shall it be corruption or life everlasting? May God's Holy Spirit help you in the decision you make.

#### CAMPING OUT GENERALLY; ITS INFLUENCE ON HEALTH, ETC.

I have often heard of the appetite and resulting health that follow camping out in the open air; but I confess I never realized it till we had been out several days. Of course, I rode my wheel a great deal; and when just a little fatigued I would throw it on the canvas covering the bedding on the back part of the wagon, and then sit on it to keep it in place. This wheel-riding would of itself give me an appetite; but the sleeping in the open air is certainly a large factor in the matter. No room, no matter how open, can give exactly the same clear pure air that you get outside with only the stars overhead. My friends had brought such a bountiful supply of blankets that I never felt the least bit cold.

In stopping for dinner or for the night, the two important things are "wood" and "water." It seems very strange to eastern folks that either should be scarce; but on the desert, water is

found only at certain points, unless there has been rain recently; and wood is so scarce near these watering-places, because it has been so carefully scraped up, that we once or twice paid 25 cts. for a very small armful. While the men cared for the horses I usually built the fire and cooked the oatmeal, toasted the bread, "set the table," etc. Setting the table consisted in turning over the lid of the lunch-box and resting it on a water pail turned upside down. Mr. Carey made the coffee, and I never drank such delicious coffee before, and never expect to again. You may ask, "How about plain hot water you have lauded so much?" Well, coffee seems specially made for camping out; and if the water is the least bit alkaline the coffee disguises the taste. I did not use sugar, but did use concentrated milk. Mr. Elvey cooked the quails and beefsteak. The most nourishing and delicious steak I ever ate we bought at Antelope,  $2\frac{1}{2}$  lbs. for 15 cts. The mountains of Arizona can produce beefsteak as cheaply as or cheaper than any other country in the world; and one who knows how can cook it over a camp-fire so as to be nicer than any restaurant or hotel cook ever thought of doing. I am not going to claim that the mountain and desert air did not have something to do with it. I gained 11 lbs. in weight during the two weeks' trip, as nearly as I can make out, and now weigh as much, perhaps, as I ever did in my life.

Just a word more about the beef and cattle. Where there is plenty of rain, cattle can be grown on the mountains, I am told, at a cost not exceeding *one dollar per head*. When these cattle are of proper age they are driven down to Salt River Valley, where they quickly become fat on the wonderful alfalfa. Imagine a field of forty acres in January, as green as a clover-field in June, and the plant almost knee-high. Stock enough is turned on to eat it down close to the ground, then they are removed to another field, water is turned on, and in a few weeks the field is green with another crop. So valuable is this alfalfa with its many crops in a season, that some fruit-ranches are being cleared to make room for alfalfa, because the latter pays better than the fruit.

Let us go back to arid plains and mountains again. During the whole of 1895, more rain fell than for many years, and feed is now so plentiful that there is not stock enough to consume it all. Previous to 1895 there were two or three years of deficient rainfall, and thousands of cattle starved, and some of the owners became bankrupt. Go where you will, the bleaching skeletons of starved cattle are found. All along the roadside they are common. A dead cow by the wayside is too common to occasion remark, and no care is taken to bury the carcass; for in this arid climate it just dries up, emitting very little or no smell at all. The bones are not collected, as they are in Texas and other places, for the reason that the cost of shipping is more than their value at present. Around "Skull Valley," bones are so plentiful as to suggest its name.

Alfalfa is made into hay in the spring and summer—seldom in winter, on account of difficulty in curing properly. It is pressed into bales of about 100 lbs. each, and these are retailed in Salt River Valley at 25 cts.; but after we were out two days in the desert (at Antelope) the price was \$1.25 per bale. You see they count it worth a dollar to haul 100 lbs. two days. I am told that small farmers who find a spring in some canyon, so as to irrigate a small field in these localities where hay is so high, get to be well to do in raising alfalfa alone. To save hauling so much weight and bulk we tried grain instead of alfalfa hay; but our horses

greatly preferred the hay, and seemed to work better on it; in fact, we found it hard to get them to eat any kind of grain if they could get their favorite alfalfa hay.

#### MONTEZUMA'S WELL.

Within twelve or fifteen miles of Camp Verde, off toward Flagstaff, is the celebrated Montezuma's Well. I started ahead of the team, on my wheel. When I got pretty near the locality, I wanted to make some inquiries. I saw a lot of little girls playing near a schoolhouse. As it was a little off the road I turned my wheel in that direction, proposing to ride up and make inquiries. As soon as they saw that strange-looking craft making toward the group at pretty good speed, they with one accord put for the open door of the schoolhouse, with a speed equal to if not greater than what I could make on the wheel. One of the older ones, however, ventured to give me the desired information. A little later the team came near enough so that Bro. Elvey informed me that, if I would go to the top of the hill yonder, plainly in sight, I could find Montezuma's Well.

The team passed on to the place where we were to stop over night, near by. I followed the trail with my wheel until I was nearly at the top of the hill; then I proceeded to go up the rest of the way on foot. Was it the exercise of riding or the excitement of the moment in thinking that I was at last so near this celebrated freak of nature? And is it really possible that right on top of this hill here before me I am to find this far-famed *well* of Montezuma? I had almost reached the summit, and began to think there was some mistake, when, lo! at my very feet yawned a huge rocky cavern or drop. From where I stood, straight down, it was nearly a hundred feet to the water, and the well is almost circular. I believe the distance is about 200 feet across. I threw a stone with all my might, but it came a good way short of reaching the center of the pool. Sure enough, as I had been told, air-bubbles kept rising continuously where the stone went down. The report is, that ropes tied together have been let down 500 feet without striking any bottom. By leaning over the edge of the precipice I saw, perhaps a third of the way down, the cliff dwellings that those queer people of olden time built even into the sides of this well. It made me think of the swallows' nests under the eaves of a barn. It was so near night that I did not undertake to explore the dwellings. In fact, it is a dizzy piece of business any way, with that bottomless pit of water to catch you in case you should fall. On the opposite side from where I stood, the rocky wall is a little more broken. In fact, there is a trail made by the feet of many visitors where they get down. At the bottom of this trail is a little piece of ground not covered by water; and a tree and some bushes of some size grow here. Right back of the tree there is a cave, or, rather, two of them. One of these is occupied by more cliff dwellings. In fact, they go back into the rock a considerable distance. The other, the right-hand branch, leads down through many crooks and turns into a place where you may hear running water. This is the water that constantly overflows from the well, and passes off through the rocky sides of the hill until it finds an outlet in Beaver Creek; and some enterprising fruit-grower or farmer has caught the stream, and carries it away in an irrigating-canal to his ranch. The volume of water that goes out is perhaps large enough to fill a good-sized stovepipe. By looking carefully around the margin of the bottom of the well you will find a place where the waters go gurgling down through the broken rock.

Whence came this batch of curiosities? What made this well in the top of the hill? Friend Elvey explains it by calling it the crater of an extinct volcano. At some former period, he thinks, the volcano blew out this hole. The hill surrounding it is made up of the matter thrown out, and water found its way in, filling up the crater, and overflowing till it found an outlet through the side of the hill into Beaver Creek. Mr. Robert Phinney, who lives near by, has another explanation. He thinks the underlying rock is something more or less soluble in water, and that the spring of water coming up through has dissolved the rock and carried it away. As a proof of this, the water from the well even now holds a large quantity of minerals in solution. The deposit on sticks and stones, something like petrefaction, shows this. As the water is moderately warm at all seasons of the year, where it comes out into Beaver Creek on a frosty morning it sends up quite a little steam or vapor; and a beautiful growth of "maiden-hair" ferns follows the path of this warm spring water from its exit out of the cliff down to Beaver Creek.

By the time I had finished my examinations a man came galloping up to the summit of the hill, on horseback. It would surprise people here in the East to see how carelessly and recklessly people ride on horseback along the mountain canyons. The trail down the hill was so steep that I sprang from my wheel; but while we were talking, the man turned about in his saddle; and while he was looking right back toward me, his horse came to a series of rocky precipices, some of them two or three feet straight down among the jagged rocks. Right down this rocky pathway the horse went with a sort of lope, and his rider had his head turned toward me, and did not even look to see where his horse was going. I stood still in open-mouthed astonishment. The horse went clear to the bottom safely, and then loped off through Beaver Creek and up the hill on the other side. I do not suppose that one of the horses here in the East could have been *coaxed* down that path among those jagged rocks, by any hook or crook; and yet this horse plunged down boldly without so much as hardly slacking his speed. So much for the matter of education.

About half a mile from the well I found the home of Robert Phinney. As a rule, through the desert mountains and all around Camp Verde the houses are very modest and humble. In fact, it is generally agreed that such expensive homes as we have here in the East are not needed; for snow is seldom seen, and the only frost or freezing is during the night. During the coldest weather it sometimes freezes so as to give the children a little slide early in the morning; but when the sun gets away up high in the middle of the day, it is almost always comfortably warm if you get out in the sun. This is why they put so little expense on their dwellings. But Mr. Phinney's home presents a vivid contrast, and I was a little surprised to see a beautiful house made of hewn stone with contrasting colors—a house that we would call pretty in any town or city in our land. I began to make some inquiries, and was told something like this:

"Oh! Mr. Phinney, he married the schoolma'am, and she made a picture of the house before it was ever built. She's an awful good schoolma'am, and the people like her so well they could not let her go, and so she teaches school now even if she is married."

Now, I have not time to tell you *all* about the pretty little home belonging to Mr. and Mrs. Phinney; but I want to say that the inside is fully in keeping with the outside. Books,

papers, periodicals, and all the appliances of modern comfort and luxury, are found in that little home. In fact, the furniture is mostly made up of gems of modern date. When I first came in I noticed a beautiful rattan chair with three links of a chain surmounting the back. Friend Elvey pretty soon began to joke with the owner about being an Odd Fellow, even if he was away back in the hills. At this the bright and vivacious mistress of the home looked up inquiringly, and replied:

"Why, my husband is not an Odd Fellow, neither is he a member of any secret society." And then she added, mischievously, "In fact, it was in the bargain before we were married, that, instead of going to lodges and society meetings, he should spend his evenings at home with me."

Now, Mr. P. is a very quiet man. He is every inch a gentleman, and always looks smiling and good-natured, although he does not talk very much. He did not make any reply, only to smile a little *more* good-naturedly at this explanation from his wife. I wish that Mrs. Root, when she gets thus far in reading my story, would please skip say a dozen lines or so; and while she is skipping ahead I want to say to the readers of GLEANINGS, a little aside, that I am not a bit surprised that Mr. Phinney decided in his own mind he would rather spend his evenings with this bright, intelligent little schoolma'am than even to take a *look* toward all that the secret societies and lodges in this whole wide world can offer by way of contrast. If he did not so decide, I am sure I should have done so if I had been in his place. Out in the country, I believe that, as a general rule, the husband *does* usually spend his evenings with his wife and children. If there are no children, then there is a still better reason why he should stay at home with the wife, to keep her company.

It is just being discovered in this neighborhood that apples and other fruits grow to wonderful perfection; and these two friends have already put out an orchard of thrifty young apple-trees; and one evening was spent quite profitably and pleasantly in discussing the different varieties of apples; and I was very glad indeed to find that my recent enthusiasm in that direction had given me some knowledge of pomology. Right close by Mr. Phinney's apple-orchard are some wonderful soda springs. The water comes bubbling and boiling up through a bed of white sand. I will tell you about them in our next issue.

---

#### THE SUFFERING ARMENIANS.

The National Armenian Relief Committee recently forwarded to Turkey \$35,000. They have just received a cable message from the International Committee at Constantinople, of which the British Ambassador is Chairman, acknowledging the remittance, and stating that the funds in hand are entirely inadequate to meet the awful suffering and destitution, and that careful investigation has shown that not less than 40,000 children have been made orphans by the late massacres. These "wards of Christendom" can be easily saved from starvation or debasing enslavement in Moslem homes, and can be cared for at the rate of a dollar a month; but thousands will perish before spring unless generous gifts are sent at once to Brown Bros. & Co., 59 Wall St., New York, who are the authorized treasurers.

SPENCER TRASK, Chairman,  
FRED D. GREENE, Secretary.

New York, Feb. 2, 1897.

□ We clip the above from a communication just received. I may add here that a sum of money sent from Medina a few days ago was reported to be in the hands of missionaries in Armenia within 48 hours, the arrangements by

cable enabling us to reach the sufferers thus quickly. Now, there is one hopeful feature to me in the work that is going on. With the activity at present being displayed in relieving the sufferers it does not seem to me that the Turks will dare to go into any more slaughter. If they do, let them beware.

**Special Notices in the Line of Gardening, etc.**

By A. I. Root.

**REDUCED PRICES ON OUR RURAL BOOKS.**

Please read over our book list in this and the next issue, and note the great reductions in the price of many of the standard books.

**OUR WHITE PLUME CELERY SEED.**

For many years past we have been getting our celery seed from one particular house. Their prices are higher, consequently ours are rather higher; in fact, we have had seed offered us by a good many seed-growers at less than half what we now pay; but we were afraid to risk any thing cheaper. Below is a sample of the letters we get in regard to it:

Mr. Root:—The White Plume celery seed that I got from you last season produced the best lot of celery ever grown in this section. Please send me by return mail as follows: . . .  
Richfield Springs, N. Y., Feb. 7. L. P. SEATON, Florist.

**OUR JERSEY WAKEFIELD CABBAGE SEED.**

For many years past, all of our Wakefield seed has come from H. A. March, as our friends may know; and it has been extra select stock seed. Aside from the results obtained on our own ground, year after year, we have had most excellent reports from north, south, east, and west. Last summer we had cabbage from this seed—hard solid heads weighing from 8 to 10 lbs., and almost every plant made a nice head of cabbage. Seed was started in the greenhouse, in the middle of February, planted out in cold-frames in March, and then set out in the field in April. In this way the plants were hardened off so as to be nearly if not entirely equivalent to cold-frame plants. Now is the time to start your seeds under glass. See prices elsewhere.

**VEGETABLES UNDER GLASS.**

In our issue for Dec. 1, page 871, I reviewed a little book entitled "Vegetable Gardening." I said that, although the price was \$1.00, the book was hardly worth 25 cts. Just now, however, we have got a little book from that veteran seedsman, Henry A. Dreer, entitled, "Vegetables under Glass," and it is really a little gem. It really does my heart good to find something on the matter of gardening, especially gardening under glass, from those who have been years in the business, like Henderson, Landreth, or Dreer. The book is profusely illustrated, and the pictures alone are worth the price. The paper and print are beautiful. One feels sorry when he has read it all through, to think there is no more of it. Last, but not least, this little book of over 100 pages is mailed for only 25 cts. We should be glad to furnish it at this price to any who may want it. I may remark that Dreer himself has a single greenhouse covering an entire acre.

**HUBBARD SQUASHES.**

A man came in last week, saying he had about 100 nice Hubbard squashes, and wanted to know what we would give for them. I paid him 1½ cts. per lb. for 25 of the squashes. We put them on the wagon, and the greater part of them were sold in about two days. We ought to have bought all he had. When I asked him how he managed to keep them until the middle of February he said it was a very easy matter when one has learned how. The squashes must be picked before they are frosted in the least. They must be handled like eggs, and put in a dry room upstairs, where it will not freeze. It will not do to put them in the cellar. Cellars are too damp, and mostly too warm. Keep them in a dry cool room as near freezing as you can, and yet not have them freeze. Now, friends, we have had this same state of affairs winter after winter. Hubbard squashes are quoted in Cleveland at 2 cts. per lb., or \$40.00 a ton, and you could make lots of money

if you got only \$5.00 a ton. If you want to try it, we have an extra nice lot of seed at a very low price, especially if wanted in quantity. See price of seeds for 1897, on another page.

**GOOD ONIONS ARE WORTH A DOLLAR A BUSHEL.**

This is another thing to rejoice the heart of the farmer and gardener. One of the largest onion firms in the United States is here in Medina Co. In fact, their crop last year was so great that it received a kindly recognition in the Agricultural Reports at Washington. Well, after much care and pains they brought their whole crop through the terrible blizzard of the last week of January. In a pleasant letter from one of the firm a few days ago he remarked that they were getting a dollar a bushel for their large fine Red Wethersfields; and if you will consult the market reports you will find that onions are from \$2.50 to \$3.50 a barrel in all our large cities. Good! Now, friends, there is going to be a scarcity until the new crop is gathered. Perhaps there never was a better opening for onions started under glass. Fix up your greenhouses; get your hot-beds and cold-frames going, and get in some onion seeds straightway. See the low prices we quote you in this issue.

**SEED POTATOES AS PREMIUMS FOR GLEANINGS.**

Now it is near to planting-time, please remember that everybody who sends us \$1.00 for GLEANINGS, past, present, or future, may have, as a premium, 1 lb. of Thoroughbred potatoes for every dollar he sends us, or 2 lbs. of any other kind in the list. Still further, if any present subscriber will get us a new name, that is, will get GLEANINGS going into some neighborhood where it is not now going, we will give him a peck of Thoroughbreds or ¼ bushel of any of the other kinds. Of course, you must pay the shipping charges. If any of you like small potatoes for planting, you may have just twice the quantity of seconds. See revised prices below:

NAME	Varieties are in order as regards time of maturing; earliest first, next earliest second, and so on.							
	1 lb. by mail.	8 lbs. by mail.	½ peck.	Peck.	¼ bushel.	Bushel.	Barrel—11 pk.	
White Bliss Triumph . . .	\$ 15	35	20	35	60	\$ 1.00	\$ 2.50	
E. Thoro'bred, Maule's * . .	30	75	50	80	1 50	2 25	5 00

New Craig . . . . .	15	35	20	35	60	1 00	2 50	

\* 50 strong eyes, by mail, postpaid, \$1.00.

We can furnish seconds of the Thoroughbred, Burpee, Freeman, New Queen, Sir William, Carman No. 1, and New Craig, at half the above prices. All the others are sold out. Please note that this low price on seconds does not apply to potatoes sent by mail postpaid.

**THE NEW QUEEN AS AN EARLY POTATO.**

In our experiments last year the New Queen gave good early potatoes almost if not quite as soon as any of the extra earlies. The quality was also, and is now, next to the Freeman. Furthermore, it is less liable to scab than any other potato known, on our Medina clay soil. Last, but not least, it gave us the enormous crop of 375 bushels per acre, right through a pretty good-sized field. Now let me call your attention to the low price at which we offer this splendid early potato—only \$1.25 a barrel; and if you care to plant medium-sized and small potatoes, we offer some extra nice seconds at only 63 cts. per barrel. At these prices the New Queen is perhaps as good a potato for table use as you can find. Our low price is not because they are in any respect behind the others, but because we have almost a thousand bushels to dispose of. Please notice in the table our drop in the prices of Thoroughbred, Burpee's Extra Early, Freeman, Sir William, and Carman No. 3.

#### MANUM'S ENORMOUS POTATOES.

We would advise all of our readers to send for Manum's circular in regard to these new potatoes. We can mail them to you on application. The reports in regard to the yield and quality are certainly something wonderful, especially those from the experiment stations of Pennsylvania, Ohio, Michigan, Minnesota, Wisconsin, and Massachusetts. All these give it a big recommend. It seems to me, however, that not one of them sufficiently emphasizes the fact that the Enormous will keep away along into the spring and clear through hot weather, in better order for eating or planting than almost any other potato that has been brought before the public.

By the way, I want to quote just one short paragraph in Manum's circular, inasmuch as it indirectly pays quite a compliment to our own Craig Seeding:

"One of our local potato-buyers remarked, after cooking a mess, 'They are the finest potato I ever put on my plate.' This test was made in July, when the potatoes were nearly one year old, which shows their good keeping qualities. In this respect they are not excelled by any variety I ever had, and equaled only by the Craig Seeding."

Permit me to add that, at the very low price we are offering the Enormous, our stock will soon be closed out. We were prevented from giving them a fair test on our own grounds last season, from the fact that they happened to be planted on a piece of ground that was several times under water, in consequence of the extreme and unusual floods when the potatoes were almost mature. The standing in water rotted the Enormous and every other kind of potato.

devised a special cap to fit the Lightning jar, which is more common in some places. We find this jar, with the special cap, fits nicely the regular feeder-box made for Mason jars. These special caps for Boardman feeders, made for either Lightning or Mason jars, without the wooden box, will be supplied at 8c each; 80c per doz.; \$6.00 per 100. Unless you specify when you order, we will send them to fit the Mason jars. These special caps can be sent by mail for 2c each extra; dozen lots, 15c for Mason tops; 10c for Lightning, to cover postage.

#### AGENCIES.

Owing to long continued ill health our Florida agency at San Mateo, in charge of A. F. Brown, has been discontinued. Mr. Brown still has quite a stock of some lines of goods which he will dispose of as he has opportunity, and he may be reached by addressing him at Seminole Grove, Harwood, Volusia Co., Fla. Wm. A. Selser, taking charge of our agency at No. 10 Vine St., Philadelphia, Pa., is prepared to supply the southern trade, especially on the eastern coast. He has arranged to ship either from New York or Philadelphia on special through rates by boat. The Rawlins Implement Co. continue to handle our goods at Baltimore, Md.

The bee supply business conducted in Denver, Colo., by Barteldes & Co., is now in the hands of the L. A. Watkins Mds. Co., who have taken over the stock and good will, and will continue to supply our goods.

#### CARLOAD SHIPMENTS.

We have shipped so far this season an assorted carload of supplies to J. M. Jenkins, Wetumpka, Ala., who is the leading supply dealer in Dixie. We have also shipped a carload to D. M. Edwards, Uvalde, Texas, which is one of the best honey-producing sections of that State. Another car has just gone to Jos. Nysewander, Des Moines, Ia. Geo. E. Hilton, of Fremont, Mich., has also had a car, consisting in large part of his chaff hive, which is deservedly popular in his section. As we go to press we are loading a car for Syracuse, N. Y., which will be followed as soon as possible by one for Mechanic Falls, Me., Philadelphia, Pa., St. Paul, Minn., Chicago, Ill., and to Buell Lambertson, Portland, Or. We have already shipped one large carload across the big pond to Scotland, and are loading another as we go to press, which will also be followed by two more cars, a little later, for which orders are already in, and goods nearly ready. We are running full time, and shall likely be running over time soon. We anticipate a heavy trade this season, and advise our customers to get their orders in early, that you may not be disappointed.

#### ADDITIONS AND CHANGES IN PRICES.

Besides the improvements mentioned in last issue of GLEANINGS in the Hoffman frames, covers, bottoms, etc., and the change in numbering hives as well as the lower prices on hives, we call attention to other changes as follows: The new list of prices on sections published in last issue, and new prices on foundation noted in a previous issue. Prices of smokers are changed. The Cornell is now 75c, and the Crane \$1.25; by mail, 25c each extra.

New prices on Bingham smokers will be found on another page of this issue. More prominence is given to the Porter bee escape, which, as a labor-saving implement, is not half appreciated by beekeepers generally. Unfortunately the first catalogs printed have the old price on the honey-house escapes. The new price on this form of escape adopted for this year is 25c each; \$2.75 per doz., postpaid or with other goods. We call attention to improvements in shipping-cases.

For the benefit of eastern and southern customers who use square glass jars, we have made arrangements with a manufacturer in the East whereby we are able to make shipments direct from New York or Philadelphia, and at slightly lower prices. To secure these prices, however, your order must be for at least 2 gross of 5 or 8 oz. sizes, and 1 gross 1-lb. size;  $\frac{3}{4}$  gross 2-lb. size. These are regular-sized packages, and they can not be repacked to supply smaller quantities except at an advanced price.

We are also offering Mason fruit-jars very low, but will not be ready to deliver them for about six or eight weeks from this date. Enamelled cloth we have been obliged to mark up to 25c a yard; \$2.50 per piece of 12 yards.

#### OUR CATALOG FOR 1897.

We have succeeded in completing some of the new edition of our catalogs for this year before going to press with this issue of GLEANINGS. During the next few weeks we expect to mail upward of 100,000 catalogs. If we do not get around to your name as soon as you would like, drop us a postal and you will get a catalog back by next mail. We have the wrappers already addressed, but of course it will take time to print and mail so large an edition.

#### SCREEN WIRE CLOTH.

There seems to be a strife between the manufacturers of window screen wire cloth, and very low prices are ruling. We are prepared to furnish any of the ordinary widths, 24, 26, 28, 30, 32, 34, and 36 inches in full rolls, 100 feet long, at \$1.25 per 100 square feet, making the price of a full roll, 24 inches wide, \$2.50; 30 inches wide, \$3.13; and 36 inches wide, \$3.75, and other widths in like proportion. Cut pieces of not less than 20 square feet at  $\frac{1}{4}$  c per square foot. The color of cloth furnished will be green unless otherwise specified.

#### AUGITE MATS, AGAIN.

We supposed that the last reduction made in the price of these mats would be the very last; but we are obliged to record a further reduction. This, too, is for the original and genuine augite mat which is and always has been, the best one made. We now offer them, postpaid, at 10 cts. each; 3 for 25 cts.; 1 doz., 85 cts. Not prepaid, 5 cts. each; 3 for 10 cts.; 35 cts. per doz.; \$3.50 per gross. Here is a chance to do you self and your neighbors some good. You could easily sell these mats at 5 cts. each from house to house, and leave a blessing wherever you sell a mat, and at the same time make a fair profit for your work.

#### BOARDMAN FEEDER.

This feeder was in great favor last season for spring feeding, and large quantities were sold. We find that in some sections of the country the Mason jars are not in common use.

We have not only arranged for a carload of Mason jars so as to supply them at low prices to those who can not get them reasonably near home, but we have

WIRE-CLOTH STAPLES.

We have a little staple  $\frac{3}{8}$  wide,  $\frac{3}{8}$  long, that is far superior to a tack for attaching wire cloth to queen-cages, hives, door, and window-screen frames, etc. They are very fine, and as great many to a pound. We can supply  $\frac{1}{2}$ -lb. package at 5¢; by mail, 10¢; 1 lb., 15¢; 5 lbs., 60¢. Postage extra, 18c per lb.

END-SPACE STAPLES.

Those who wish to try the end space staple and shortened top-bar, as mentioned in last issue, will find the special staples we have had made for the purpose, superior to any regular staple you will find in the market. We will furnish  $\frac{1}{2}$  lb. sufficient for 100 frames, with gauge for driving, for 5c, or by mail for 10c. Price of 1 lb. will be 15c; 5 lbs., 60c. By mail, 18c per lb. extra for postage and packing.

Comb Foundation.

Cheaper and better than ever; clear as crystal, for you can read your name through it. Process and machinery patented Dec. 8, 1896, and other patents pending. Samples of the new foundation free.

Root's Goods.

Before placing your order for this season, be sure to send for Root's 1897 Catalog, ready now.

Our 1897 hives, with improved Danzy cover and improved Hoffman frames, are simply "out of sight." Acknowledged by all who have seen them to be a great improvement over any hive on the market, of last year.

Barred Plymouth Rocks,

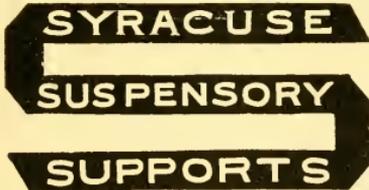

S. C. Brown Leghorns, Lt. Brahmas.

### LADY MARTHA WASHINGTON.

The illustration presented above represents one of the most remarkable B. P. Rock hens ever produced. She was hatched and raised by J. W. Whitney, of Chatham, Ohio. Is now four years of age, and has won the following list of prizes:

- 1st prize at Washington, D. C., Jan. 12-16, 1897.
- 1st " Hagerstown, Md., October, 1896.
- 2d " West Chester, Pa., October, 1896.
- 2d " Reading, Pa., October, 1896.
- 2d " Toledo, Ohio, January, 1896.
- 2d " Medina, Ohio, December, 1895.
- 3d " Medina, Ohio, January, 1895.

To those of our readers who are interested in poultry we would say Mr. Whitney's circular contains a full description of his fowls and valuable information as well. It is free. Write for it.

and protects the scrotum, and should be worn in every case where there is any drooping of the scrotum. It is especially recommended to wheelmen, equestrians, base-ball, foot-ball, and lawn-tennis players, athletes, men doing heavy work, much walking or standing, etc. Ask your physician's advice about wearing a Suspensory—perhaps it will relieve your backache. Our \$1.00 grade is very popular, and your dealer, or we, will sell you one and refund money if not perfectly satisfactory. For sale by all druggists and dealers in athletic goods. Send for price list. **A. J. WELLS MFG. CO.,**  
250 Tallman Street, Syracuse, N. Y.

### Sweet Potatoes.

½ pk. G. C. Prolific, ½ pk. G. Grant, 3 pks. Yellow Jerseys, all for ONE DOLLAR. Here is an opportunity to try the *new* vineless varieties at a small cost. **J. Q. MULFORD**, Lebanon, Ohio.

# Revised Price List of Garden Seeds for Feb. 15.

Please notice that any or all seeds mentioned below are sold in five-cent packages, postpaid by mail. For 10 papers ordered at one time, 40 cts.; 100 papers, \$3.50. Of course, scarce and high-priced seed will necessitate making only a very small amount of seed in a package; but by far the greater part of them contain a full half-ounce of good fresh seeds. By comparing these packages with those you get of many of the seedsmen you will notice the liberal amounts we furnish for only 5 cts. It is true, we do not give presents or cash prizes; but we believe the most intelligent people of the present day would prefer to have their money's worth of what they ordered, rather than to compete for a prize. The five-cent packages are sent postpaid; but the price of all other seeds does not include postage; therefore, when you order seed by the ounce or pound, allow postage thus: 9 cts. per lb.; 5 cts. per  $\frac{1}{2}$  lb., or 1 ct. per oz. Peas and beans by the pint and quart must also have 8 cts. per pint or 15 cts. per quart; for corn, add 12 cts. per quart for postage. Postage to Canada is double the above rates. One-fourth ounce, pound, or peck, will be sold at ounce, pound, or peck rates unless otherwise specified. In the enumeration below, no description of the seeds is given, as you may notice. Our complete catalog, with full description, will be mailed on application if you have not already received it.

## ASPARAGUS.

**Asparagus, Palmetto.** Oz. 5c; lb. 40c.  
**Asparagus Roots.** 2 year old. Palmetto, 10 for 10c; 75c per 100; \$6.00 per 1000. 3-year-old roots not available. 1 year roots, 10, 10c; 100, 50c; 1000, \$4. By mail, add 5c for 10; 25c for 100.

## BUSH BEANS.

**Kumler's Bush Lima.** Qt. 25c;  $\frac{1}{2}$  pk. 75c; pk. \$1.25.  
**Burpee's Bush Lima.** Pt. 15c; qt. 25c;  $\frac{1}{2}$  pk. 75c; pk., \$1.25; bu., \$4.50.  
**Henderson's Bush Lima.** Pt. 10c; qt. 18c; pk. \$1.00; bu. \$3.75.  
**Kidney Wax.** Qt. 10c; pk. 60c.  
**Best of All.** Qt. 5c; peck, 40c.; bush., \$1.25.  
**White Kidney, Large.** Pt. 8c; qt. 15c; pk. 75c; bu. \$2.75.  
**York State Marrow.** The best field bean. Qt. 10c; peck 75c; bu. \$2.50.  
**Navy.** Qt. 5c; pk. 35c; bu. \$1.25.

## POLE BEANS.

**Extra-Early Lima Beans.** Price,  $\frac{1}{2}$  pt., 8c; qt. 20c; peck \$1.00.  
**King of the Garden Lima.**  $\frac{1}{2}$  pt. 8c; qt. 20c; peck, \$1.00.

All of our beans will be furnished in 5-cent packages; but where they are to go by mail, postpaid, of course the above packages will have to be quite small. If wanted by mail, add 8c per pt. or 15c per qt. for postage.

## BEETS.

**Eclipse.** Oz. 5c; lb. 25c; 5 lbs. \$1.00.  
**Lane's Improved Sugar.** Oz. 5c; lb. 15c; 5 lbs. 60c.  
**Long Red Mangel.** Oz., 5c; lb., 15c; 5 lbs., 70c; 10 lbs., \$1.20, 20 lbs. or more, 10c per lb.  
**Golden Tautard.** Oz., 5c; lb., 15c; 5 lbs., 70c; 10 lbs., \$1.20; 20 lbs. or over, 10c per lb.

## CABBAGE.

**Select, Very Early Jersey Wakefield.** Stock seed. Oz. 20c; lb. \$2.50.  
**Henderson's Early Summer.** Oz. 10c; lb. \$1.00.

## CARROTS.

**Early French Forcing.** Oz. 5c; lb. 50c.  
**Orange Danvers, Half-Long.** Oz. 5c; lb. 50c.

## CAULIFLOWER.

**Henderson's Early Snowball.** Raised by H. A. March.  $\frac{1}{2}$  oz. 25c;  $\frac{1}{4}$  oz. 40c; oz. \$1.50.

## CELERY.

**Henderson's White Plume.** Oz., 20c; lb., \$2.00.  
**Golden Self-Blanching Celery.** Oz., 20c; lb., \$2.00.  
**New Rose.** Oz. 20c; lb. \$1.75.  
**Giant Paschal.** Oz. 20c; lb. \$1.50.  
**Dwarf Golden Heart.** Oz. 10c; lb. \$1.25.

## CORN (FOR TABLE USE).

Corn we sell at 5c per half-pint package; but at this price purchasers must pay the postage, which is 3c for each half-pint. If wanted in larger quantities the price (where no price is given) will be, pt., 7c; qt., 10c; pk., 50c; bu., \$1.75.

**Cory's Extra Early (white cob).**  
**Stowell's Evergreen.** Pk. 40c; bu. \$1.25.  
**Ford's Early Sweet.**  
**Late Mammoth Sugar.**

**Country Gentleman, or Improved Shoepeg.**  
 Pk. 50c; bu. \$1.25.

**Sweet Corn for fodder.** Pk. 30c; bu. \$1.00.

## CORN SALAD.

Oz. 5c; lb. 40c.

## CRESS.

**Extra Curled, or Pepper Grass.** Oz. 5c; lb. 30c.  
**Water Cress, true.** Oz. 30c; lb. \$3.50.  
 Watercress-plants, strong and nicely rooted. Postpaid, by mail, 10 for 15c; 100, 50c.

## CUCUMBER.

**Early Frame.** Oz. 5c; lb. 30c.  
**Improved Early White Spine, or Arlington.** Oz. 5c; lb. 30c.

**Yellow Aberdeen.** Oz. 5c; lb. 30c.

**Breadstone.** Oz. 5c; lb. 30c.

**White Egg.** Oz. 5c; lb. 30c.

### Novelties for 1897.

**Davis Wax Bean.** Pt., 10c; qt., 18c; 4 qts., 65c; pk., \$1.25; bu., \$4.00.

First and most important, perhaps, is the Davis wax bean. This was brought out by Eugene Davis, of Grand Rapids, Mich., the man who gave the world the Grand Rapids lettuce. This wax bean may not be specially superior to others in its crop or snap beans; but it has one advantage over all wax beans that have hitherto appeared. When it ripens it gives a pure white kidney-shaped shell bean; therefore if you do not succeed in selling your whole crop in the green state you can just let them ripen, harvest them, and what you do not want to plant can be sold as a table bean. All other wax beans are more or less colored and spotted, and a white bean is the only one that will sell everywhere for table use. The Davis wax bean is as early as any, as bright and clean, and free from rust, and are fully as large yields. Some of the catalogs claim that it excels in one or all of these particulars. After having grown quite a good many I suspend my opinion. We offer seed of our own growing at above prices.

**Earliest-in-the-world Tomato.**  $\frac{1}{2}$  oz., 15c;  $\frac{1}{4}$  oz., 25c;  $\frac{1}{2}$  oz., 40c; oz., 75c.

In a test of nearly all kinds offered this was nearly a week ahead, and they gave us as nice, handsome, smooth tomatoes as any "in the world." They are not very large; but as it is quite fashionable now to eat tomatoes whole, these will be just the thing, for they yield wonderfully. Where they are given plenty of room the plants will often blossom and set green fruit in the seed-bed. This will do no harm, however, for we transplant them to the field with the blossoms and little tomatoes on; and these little tomatoes are the first to ripen. The seed is of our own growing. We would place the Fordhook next, as it is equally handsome, and of good size, although it is about a week later. This seed is also of our own raising, from selected fruit. Oz., 35c.

**American Coffee-berry.** Package, 5c.

This is probably a variety of the soja bean. At first we were inclined to think from the appearance that it was the same; but on making it into coffee we had to admit that coffee-berry is something different, and much more like genuine coffee. If I were going to use coffee at all I should prefer this to the real thing—principally, however, because it is nourishing instead of being stimulating. Our stock is so limited that we can for the present furnish it only in five-cent packages.

**Mills' Banner Bean.** Package, 5c.

This a plain white bean, looking much like the York State marrow; but last season it gave us the largest yield of any thing I ever saw with any of the bean family. At present we can furnish the seed only in five-cent packages.

**Northern Prolific Upland Rice.** Package, 5c.

This will certainly grow in ordinary soil, for we had quite a success with a little bed of it in our garden across the way. It looks just like ordinary rice, but it seems to yield quite well with ordinary care and culture. We can furnish it only in five-cent packages.

**Whittaker Onions.** Large—qt., 10c; pk., 75c; bu., \$2.50; small (sets)—qt., 18c; pk., \$1.25; bu., \$4.00.

These have been so fully described during the past year we will only add that they are probably an improved and exceedingly hardy variety of potato onions. They can be planted out at any time in the spring or fall. They multiply exactly like the White Multipliers. Price of either the Whittaker or White Multiplier, large onions, just right to plant out to produce small ones, or of any sizes (called sets) of either of the above, as above quoted.

**Bunch Yams and Vineless Sweet Potatoes.**

These also have proved themselves a success during the past season; but it is too early now to give prices of either plants or tubers. As soon as the weather will permit we shall be on hand with both.

THE A. I. ROOT CO., Medina, Ohio.

## FEED YOUR BEES

**PRICES OF Bingham Perfect  
Bee-smokers and Honey-knives.**

	Dozen.	Each.
Smoke Engine (largest smoker made) 4 in. stove.	\$13.00—	mail, \$1.50
Doctor .....	3 3/4 "	9.00 " 1.10
Conqueror .....	3 "	6.50 " 1.00
Large .....	2 3/4 "	5.00 " 90
Plain .....	2 "	4.75 " 70
Little Wonder (wt. 10 oz.) .....	2 "	4.50 " 60
Honey-knife .....	6.00 "	80

All Bingham smokers are stamped on the metal, patented 1878-1892—Knives, B & H.

The four larger sizes have extra wide shields and double-coiled steel wire handles. These shields and handles are an **amazing comfort**—always cool and clean. No more sooty nor burnt fingers. The plain and Little Wonder have narrow shields and wire handles. All Bingham smokers have all the new improvements, viz: Direct draft, movable bent cap, wire handles, inverted bellows, and are **absolutely perfect**.

With a Bingham Smoker that will hold a quart of sound maple wood the bee-keeper's trials are over for a long time.

Who ever heard of a Bingham Smoker that was too large, or did not give perfect satisfaction? The world's most scientific and largest comb-honey producer uses Bingham Smokers and Knives. The same is true of the world's largest producer of extracted honey. Before buying a smoker or knife hunt up its record and pedigree.

**T. F. BINGHAM, I**  
Farwell, Mich.

FIFTEEN YEARS FOR A DOLLAR; ONE-HALF CENT FOR A MONTH.

DEAR SIR.—Have used the Conqueror 15 years. I was always pleased with its workings, but thinking I would need a new one this summer, I write for a circular. I do not think the four-inch Smoke Engine too large. Truly, W. H. EAGERTY, Cuba, Kansas. Jan. 27, 1897.

I have used Bingham Smokers ever since they were out. Working from three to seven hundred colonies, twelve months in the year, I ought to know what is required in a smoker. The Doctor, 3/4 in., just received, fills the bill.

Respectfully, O. W. OSBORN, Coaling, California.

DEAR SIR:—Smokers came O. K. They are the best I have ever seen. Sell like hot cakes. Resp'tfully, WM. BAMBER, Mt. Pleasant, Mich. August 7, 1896.

**Our New Catalog is Now Ready.**

**JOHN CADWALLADER, North Madison, Ind.**

## For Sale.

At only \$3.00 per hive, fine Italian bees with good queens.

**JNO. A. THORNTON,  
LIMA, ILLINOIS.**

## Bargains in Second-hand Bicycles.

We have on hand two ladies' Defiance bicycles, made by the Monarch Cycle Co., of Chicago, and listed at \$75.00. These are last year's models, and were used by the women of Rootville last season. The two machines are in first class running order; and as they were ridden but little they are practically as good as new. They have Garford spring saddles, reversible handle-bars, 1½-inch tubing, Morgan & Wright quick-repair tires. Weight, 25 lbs. each. Catalogs and particulars will be furnished on application. We will re-enamel them, and sell them for \$40.00 each, or the two for \$77.50. Beeswax or honey at market prices will be accepted in payment. Reason for selling—we are going to have a tandem instead for '97.

A \$100 Rambler Racer bicycle for \$35.00 cash, or \$40.00 in trade for wax or honey at market quotations. The wheel weighs only 20 lbs.; has a new set of Rambler clincher tires, and is almost as good as new. It was ridden by A. I. Root during part of '96, and is just the bicycle for a boy or light-weight man. Further particulars given by applying to  
**THE A. I. ROOT CO., Medina O.**

## Wants and Exchange Department.

Honey Column.

CITY MARKETS.

**PHILADELPHIA.—Honey.**—No. 1 white, 8; fancy amber, 7; No. 1 amber, 6@6½; fancy dark, 6; No. 1 dark, 5@6; white extracted, 5@6; amber, 5; dark, 4; beeswax, 26. Our honey market is very low with some call, but a big supply. We will not buy or sell on commission any more this season. White-clover extracted always in demand, which we are buying constantly. If you have any, send sample.

Feb. 20. W. M. A. SELSER,  
No. 10 Vine St., Philadelphia, Pa

**DENVER.—Honey.**—Fancy white, 11; No. 1 white, 10; fancy amber, 9; white extracted, 5@6; beeswax, 25. There is a little better demand for both comb and extracted honey in our market. We are doing all in our power to keep up the quality and price of first-class honey, and to rid the market of any doubtful brands.

Feb. 12. R. K. & J. C. FRISBEE,  
Denver, Col.

**NEW YORK.—Honey.**—Fancy white, 11@12; No. 1, white, 10; fancy amber, 9; No. 1 amber, 8@8½; fancy dark, 7; No. 1 dark, 6@6½; white ext., 5@5½; amber, 4½; dark, 3½@4; beeswax, 26@28. There has been a little better demand for comb honey during the past two weeks. Prices, however, will not improve, as the season is about over and plenty of stock lying on the market. We have now a good demand for extracted buckwheat, candied, and bee-keepers having theirs on hand yet should market it now. Beeswax quiet.

Feb. 20. HILDRETH BROS. & SEGELKEN,  
28 & 30 W. Broadway, New York

**MINNEAPOLIS.—Honey.**—Fancy white, 12@13; No. 1 white, 10@12; fancy amber, 9@10; No. 1 amber, 8@9; fancy dark, 7@8; No. 1 dark, 6@7; white extracted, 6@7; Western, 5@6; a' ber, 5@6; dark, 4@5; beeswax, 22@25. There is no accumulation of comb honey, and this market affords a good outlet for white grades well crated. Extracted quite dull, unchanged.

Feb. 19. S. H. HALL & Co.,  
Minneapolis, Minn.

**ST. LOUIS.—Honey.**—Fancy white, 12@13; No. 1 white, 11@11½; fancy amber, 10@10½; No. 1 amber, 9@9½; fancy dark, 8@8½; No. 1 dark, 7@8; white extracted, in cans, 5½@7; amber, in barrels, 4@4½; dark, 3@4, in barrels; beeswax, 22@23½. The demand is light for comb and white extracted honey. Extracted honey—manufacturing stock—in good demand and light supply; sells best in barrels.

Feb. 18. WESTCOTT COMMISSION CO.,  
213 Market St., St. Louis, Mo.

□ **MILWAUKEE.—Honey.**—Fancy white, 12@14; No. 1 white, 12@13; fancy amber, 10@11; fancy dark, 8@10; white extracted, 6@7; amber, 5@5½; dark, 4@5; beeswax, 26@27. The supply of honey keeps up with the demand, and demands on the supply are moderate. Values are fairly well sustained, and think there are as good prospects for good spring trade as usual. Hope it will so prove.

Feb. 18. A. V. BISHOP & Co.,  
Milwaukee, Wis.

**COLUMBUS.—Honey.**—Fancy white, 12½; No. 1 white, 11; fancy amber, 9.

Feb. 15. THE COLUMBUS COM. & STORAGE CO.,  
409-413 N. High St., Columbus, O.

**CINCINNATI.—Honey.**—No. 1 white, 12@13; No. 1 amber, 10@12; fancy dark, 8@10; white extracted, 5@6; amber, 4@5; dark, 3½@4; beeswax, 22@25. Demand slow for honey. Demand for beeswax fair.

Feb. 20. CHAS. F. MUTH & SON,  
Cincinnati, O.

**CHICAGO.—Honey.**—Fancy white, 12; No. 1 white, 10@11; fancy amber, 8@9; No. 1 amber, 7; fancy dark, 7@8; No. 1 dark, 7; white extracted, 5@7; amber, 5@6; dark, 4@5; beeswax, 25@26. Very little demand considering season of year.

Feb. 18. R. A. BURNETT & Co.,  
163 So. Water St., Chicago, Ill.

**DETROIT.—Honey.**—Fancy white, 13@14; No. 1 white, 11@12½; fancy amber, 10@11; No. 1 amber, 9@10; fancy dark, 8@9; white extracted, 5½@6; amber, 5@5½; dark, 4; beeswax, 25@26.

Feb. 19. M. H. HUNT,  
Bell Branch, Mich.

**BOSTON.—Honey.**—Fancy white, 13; No. 1, 11@12; white extracted, 7; amber, 5@6; beeswax, 25. The demand for honey of all kinds is light with a full supply. Beeswax is in light supply and wanted.

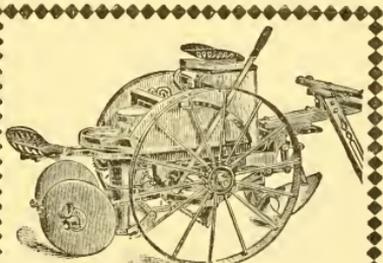

Feb. 18. E. E. BLAKE & Co.,  
57 Chatham St., Boston, Mass.

**KANSAS CITY.—Honey.**—No. 1 white, 12@13; fancy amber, 11@12; No. 1 amber, 10@11; fancy dark, 9@10; No. 1 dark, 8@10; white extracted, 5½@6; amber, 5@5½; dark, 4@4½; beeswax, 20@25.

Feb. 19. C. C. CLEMONS & Co.,  
423 Walnut, Kansas City, Mo.

FOR SALE.—600 lbs. extracted honey, in new cans and cases, \$350.00. Speak quick; who wants it?  
ELIAS FOX, Hillsboro, Wis.

FOR SALE.—1000 lbs. nice comb honey in 12-lb. cases.  
L. WERNER, Edwardsville, Ill.

# If You Want to Know

HOW to run out-apiaries for comb honey with almost no swarming, read the December **Bee-keeper's Review**. If you want to know the method followed by Mr. M. M. Baldridge in securing drawn combs for use

in the sections, read the **January Review**. If you would know how to make a home-made foot-power buzz-saw, the equal of any foot-power saw made, read the illustrated article, by the editor of the **Review**, on this subject in the **January Review**. If you want a journal that is up with the times and full of practical information that will help you in making money in the apiary, read the **Review**. It is \$1.00 a year, but if you are not already a subscriber see the special inducements offered to new subscribers in the advertisement that occupies this position in **GLEANINGS** for Feb. 15.

W. Z. HUTCHINSON, Flint, Mich.

## It is here.

The year 1897 is here, and we are happy to inform our friends and customers that we are now better prepared than ever before to fill your orders for queens and bees. We have the largest stock ever operated by us, and we mean to be ready with plenty of bees and queens to fill all orders without delay that are sent to us.

Bees by the pound, \$1.00; ten or more pounds, 90c each. Untested queens for 1897, \$1.00 each in February, March, April, and May; \$5.00 for six, or \$9.00 per dozen. For larger amounts write for prices. Have your orders booked for your early queens. Safe arrival guaranteed.

Root's goods, Dadant's foundation, and Bingham smokers. A steam bee-hive factory, and all kinds of bee supplies.

The **Southland Queen**, the only bee-paper in the South, monthly, \$1.00 per year.

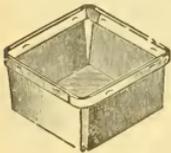

Send for catalog, which is almost a complete book on Southern bee-keeping, giving queen-rearing in full, all free for the asking. If you want full information about everything we have, and the bee-book, don't fail to ask for our 1897 catalog.

Vol. XXV.

MAR. 1, 1897.

No. 5.

**STRAY STRAWS**  
FROM DR. C. C. MILLER.

EARACHE. "A drop or two of warm honey will alleviate the pain," says Farm Furrows, in *Homestead*.

I wish friend Aikin would tell us more about the quality of sweet clover if he has some he's sure of. He calls it semi-white. What I have seen is, I think, as white as white clover.

IF GOVERNMENT should be induced to tackle *Apis dorsata*, I say double the appropriation and first try it fully on its own ground before risking by its introduction the danger of having on our hands another English sparrow.

HONEY-CURED HAMS. R. H. Rhodes has them, and says they are superb. Into a barrel  $\frac{1}{2}$  full of hams under brine he pours a gallon of best alfalfa honey, and after six weeks takes out and smokes. Nothing hard to do in that, surely.

ALFALFA HONEY is bad about granulating, says R. C. Aikin, p. 115. Isn't it possible that it may be different in different localities, just as it is amber in some places, although generally white. Its very mild flavor will always recommend it with many.

"WHEN THERE ARE different kinds and fields of bloom at the same time, bees of different colonies will be working in different fields,"—R. C. Aikin, p. 116. In corroboration I may say that, one year, two colonies stored white honey for me when all others in same apiary stored dark.

WHEN RIDING any distance on a very cold day, do not fail to have plenty of wraps for the knees. If convenient, place a lantern under the robe, and see that it has air enough so that it will not go out. You will be surprised to know the amount of heat a lantern will give.—*Homestead*.

THE *Revue Internationale* copies the article of F. Greiner, in *GLEANINGS*, as to the age when bees may commence field work, and remarks, "While very young bees may become field work-

ers for lack of older ones, and while old bees may build combs and feed brood in the absence of young bees, yet the bee-keeper does ill not to take into account the natural law of the proper division of labor."

R. C. AIKIN had good work in a good season with only two separators in a super, but it wouldn't work other years. He says, "The past 20 years I have been through all sorts of seasons, from one that did not give winter stores to an average of 227 pounds per colony, and I know that strong colonies and full-separated supers are the things for good section honey.—*Progressive*.

THE OPINION prevailed at the late Chicago convention that, when a bee-keeper gets 22c for comb, he can produce extracted of same grade for 10, 11, or 12 $\frac{1}{2}$  cents. Doolittle rips that to pieces in *A. B. J.* by saying he can get only one-quarter more extracted than comb of same grade; for to be of same grade it must be all sealed, so he must have 17.6 cents for the extracted.

"A READER" springs the question in *American Bee Journal* whether with *Apis dorsata* we should not be helpless against production of drones with worker and drone-cells all the same size. He says, "We have just been priding ourselves that we had overcome that drone business by the use of full sheets of foundation. Now we don't want to fall clear downstairs after climbing so high."

SOMNAMBULIST says in *Progressive*, "Had you noticed that Dr. Miller unwarily but openly declared that 'all his experience lay in a jug?' Here's a job for A. I. R." Sommy keeps clear of the law by not saying that something stronger than vinegar was in the jug; but you can see the spirit in him, no matter what may have been in the jug. I don't get that jug to sour very rapidly, but I've soured on you, Sommy.

MR. EDITOR, you seem to have the impression that the nails I use for end-spacing are driven diagonally. I hardly see how an exact job can be made in that way. If you look close you'll see that they are driven in perpendicularly

their full length, then bent to place. [Yes, I had the impression that you used the diagonal nails; but I now recall that they were as you state on the frame that you sent here.—Ed.]

"I WANT THE FRAMES to stick together some," says ye editor, p. 128. All right, have 'em stick to your heart's content, but remember that others, and possibly a majority, are still more emphatic in the wish that they should *not* stick. [I suspect that you do not get exactly the right idea of the little word "some." I did not mean *much* sticking, but just enough to hold the frames together without rattling while the hive is carried across the apiary. I doubt whether the majority who, when they have tested the style of frames shown on page 94, will desire to dispense with the slight sticking between the end-bars altogether.—Ed.]

IF I UNDERSTAND you correctly, Mr. Editor, side walls of cells  $\frac{3}{8}$  deep and .008 thick will be reduced to natural thickness by the bees. Now, do you know this to be the case during a flood of honey? [Yes, you understood me correctly. I based my statement on numerous measurements made by Mr. Weed. There may be a difference in some cases. As soon as deep-cell foundation is given to the bees, they begin immediately to thin down the walls to the natural thickness. The cells are so near natural, and as honey is coming in, the bees naturally conclude that it is so little work to fix up this comb they will commence on it before any thing else.—Ed.]

SUGAR is forbidden by the medical profession in diabetic cases. A correspondent asks if honey is equally proscribed. I think generally; but isn't it possible that the proscription comes from carelessly ignoring the essential difference between cane sugar and honey? Mr. Editor, can't you get a verdict from competent, conscientious medical authority that's fully up to date? [We have a good many physicians among our subscribers, and we should be glad to hear from one or more on this point. As for my own case, I know that I can not eat cane or maple sugar, without trouble; but I have partaken of honey quite freely, with no disagreeable effects. Prof. Cook is certainly right, if my case means any thing, that the bees do digest or prepare nectar so that it shall be more readily assimilated. Perhaps "digest" is not just the word; but the bees do *something*, and that *something* makes it "set" better with me.—Ed.]

WHAT A. I. ROOT SAYS, p. 131, reminds me that formerly physicians sent patients with weak lungs to some points in the West, with great results, while they don't get any such results from the climate nowadays. Formerly they were weeks on the way in open wagons, now they're shot there in a stuffy car. [Are you sure, doctor, that patients with lung complaints do not get benefit nowadays by a change of climate? A stuffy car may have something

to do with it; but as their duration there is so *very* short (shot through space) it seems to me it would make but little difference either way. But if I had consumption I would stay at home and go on the beef diet. I have seen it work admirably in cases right under my observation, so I have unbounded faith in it, provided the patient does not wait too long. It will cure nearly every thing *providing* the patient has grit—that is, self denial—and does as *he is told*.

### DRAWN COMBS.

HOW THEY HINDER OR PREVENT SWARMING;  
HOW THEY ADD ONE-THIRD TO THE  
CROP; A VALUABLE ARTICLE.

By J. E. Henderson.

I am very much interested in the subject of drawn combs that is being discussed in GLEANINGS; and as the editor calls on others to write I will give some of my experience.

I have been using drawn combs for over 15 years, and I would just as soon think of doing without them as I would think of doing without bed-clothes on a cold night. They are the most valuable property a bee-keeper can have. I am like the editor—I have tested this matter of drawn combs very carefully, not only in my own apiary, but in some of the leading and largest apiaries of other apiarists; and I find from experience that bees will invariably take to the drawn combs first, then to full starters next. As yet I have never leveled down, but will give it a test this season.

I find there are several advantages in using drawn combs. The bees will commence sooner and finish sooner; and by their use the bees are not so prone to leave the case on cool nights, which is quite an item. I always place four drawn combs in the center of each case as a nest-egg, and I find these combs just as fancy as those drawn from foundation.

On page 79, J. E. Crane says if they are not cut down the bees hesitate about sealing them, and are apt to be dirty in appearance. The brother's bees up there act differently from mine. I find my bees work on sections of full depth, and seal over much sooner than from sections of full starters of foundation. If drawn combs have had the proper care in the fall and winter, I should much rather have them than foundation. I don't think these combs are appreciated by bee-keepers to the full extent of their value. I also find, when cases are supplied with drawn combs, and bees once fairly at work in them, it lessens the desire to swarm when put on eight or ten days before white clover comes in bloom.

By the use of drawn combs it will make a difference of a third of a crop more in their favor, even in a poor year. In 1892 I took two hives of bees, as nearly alike as two peas. One I supplied with drawn combs the whole season through, and the other with full starters of foundation comb. The one supplied with drawn combs gave a surplus of 162 lbs. of fancy honey; the one supplied with foundation gave a surplus of 120 lbs., and not any more fancy than the first one. It was all from white clover.

I have been experimenting in this line for quite a number of years, with good results. For this reason I am in favor of drawn combs. I also find that, with drawn combs on during a poor year, I can get nice sections of honey when they would not even draw out foundation. I don't doubt in the least that the day is not far distant when we all shall be using drawn combs made by machinery.

Elm Grove, W. Va.

[The article above sets forth from a practical standpoint all or nearly all the advantages that I suggested might accrue from a theoretical standpoint, as set forth in my convention paper read at Lincoln. That drawn comb will hinder swarming can hardly be doubted. In all our experience we never had any trouble in preventing natural increase when we gave the bees plenty of empty extracting-combs; and the same must hold true with the drawn combs and sections, to a very great extent.—Ed.]

#### COMB FOUNDATION AND DRAWN COMB.

FISHBONE IN ORDINARY FOUNDATION; USING THE BUCKWHEAT SEASON TO SECURE DRAWN COMBS IN SECTIONS; GOOD SUGGESTIONS.

By F. Greiner.

The value of comb in producing honey, both extracted and in the comb, has long been well understood; and it seems all ought to agree pretty well on the subject, at least now, after all that has been said of late. I am not going to offer any evidence to prove how much more honey may be produced by the use of ready comb, as it is generally conceded the gain will more than pay the cost; but I may offer some suggestions as to how to secure the comb.

The producer of extracted honey, of course, has no trouble in obtaining all the comb he may need in a short time; and, once in possession, he is well fixed. It is far different with the comb-honey producer; his combs are sold with the honey, and a new supply must be looked for every year. Fortunately we are not situated as are our German honey-producers. After setting forth the advantages of our little pound sections to them, Vogel, the German, made the following reply to me: "Our honey seasons are not to be compared with yours in America. Of this I am sure. It would take us one year to have the comb built in such sec-

tions; another year to have them filled and finished." When the use of comb foundation was suggested, Vogel again replied: "To secure comb honey, which will attract and satisfy our buyers, the comb will necessarily have to be built from the very start by the bees; comb foundation is not wanted."

I myself have not yet learned "to chew" even chewing gum; and I still object to the fishbone found in comb honey built on foundation; but with our American consumers of comb honey it seems to be different. Evidently they chew and like it, and the fishbone meets with their approval.

It may be said here, that a good grade of comb foundation could not be detected in the finished product; but of this I am not so sure—at least, I have so far been seeking in vain for such undetectable comb foundation. At our last convention of the Ontario, N. Y., bee-keepers, the question of foundation in comb honey came up, and, to my great surprise, not one of the Ontario Co. comb-honey producers present had ever used or gotten hold of that "good grade" of comb foundation. One friend from an adjoining county, I will call him B, as I wish to refer to him again later on, said that he was pretty sure no such undetectable good grade of comb foundation was offered for sale, but that he had made and used such himself, and he also offered samples, which I shall test the coming season. Be that as it may, the majority of our bee-keepers had found that it paid them well to use comb foundation such as they could obtain; and since the honey-consumers do not object to use of it, if they don't object I may offer suggestions as to "how to have the foundation drawn out previous to the honey season." I must, however, first cite another saying of our friend B, above mentioned—a saying which suggested to me the idea I wish to bring out. He said: "Buckwheat honey is and has been a curse to bee-keepers." Why? "The inferior article has lowered the price of honey more than any thing else."

Now, this may be true; and while I am pondering over it the thought strikes me, "Why not use the buckwheat honey-flow for the purpose of drawing out section foundation, to have ready for the next season, thus not only relieving the market of at least a part of the inferior product, but also making our chances for a crop of a fine grade of honey the next year all the better?" Now, this is not mere conjecture. I have had quite a little foundation drawn in this way, although not exactly for use in sections. The plan will work well, I am quite sure. It would be well to have the supers, in which comb-building is to go on, protected during this time, as the nights are often quite cold. It will also be found a good plan not to allow too much room, so the foundation may be drawn out *evenly all over the frame.*

Except when the brood-nest is greatly contracted, six half-story frames may be quite enough. The frames may be removed as fast as the foundation is sufficiently drawn out, and replaced by others. Should any honey have been deposited in the combs, this could easily be removed either with the extractor, or, better, by a careful exposure in the bee-yard. One colony worked in this fashion might easily furnish enough comb to fill a dozen section supers or more, depending altogether on the honey-flow; and, further, we might continue the procedure by feeding, or, where no buckwheat is grown, feeding might be substituted.

A bee-keeping friend, located within a few miles of me, follows a similar plan to obtain comb. He sets apart his best comb-building colonies for the purpose, and during the time just previous to his expected honey-flow he feeds and thus gets his foundation drawn in half-depth frames. When drawn, the comb is cut out and fitted into the sections in such a manner as to leave a small passage-hole in each of the four corners of each section, etc.

I hope some of the readers of GLEANINGS will test these plans the coming season, and report their success.

Of course, when the perfect comb becomes a fact, comb made by machinery, so light that it can not be detected in the honey afterward, and also sold reasonably cheap, then we need not trouble ourselves any more to obtain it by feeding or otherwise. All will depend on what will be the cheapest way to attain the same or the best result.

Naples, N. Y., Feb. 6.

[I had not thought of it before, but I do believe that American consumers, so far from disliking the so-called fishbone, as a resultant from the use of foundation in sections, actually do like it. It gives them something to chew. The fact of the matter is, I suppose, the average consumer does not know how honey in natural combs does taste. If he ate the honey of his fathers, he has forgotten how it chewed; and as practically all comb honey of *to-day* on the market is built from foundation, the consumers do not know that there is any difference between comb honey from foundation and that which was made without. But this is true: The fishbone is just so much waste, and somebody has to pay for it. We have made foundation with no side walls whatever—just the mere rectangular bases united together, and we have also made foundation with very little side wall. While it is perfectly practical to make both of these articles, they have given dissatisfaction to bee keepers, owing to the fact that they would sag or stretch in the hive; we are, therefore, aiming in the new product—that is, the new deep-cell-wall foundation—to make an article that will not sag—the ability to resist stretching being due to the deep cells rather than to heavy side walls or thick bases.—Ed.]

## HOW I RAISE AND SELL EXTRACTED HONEY.

VALUABLE TRADE SECRETS FROM A VETERAN  
AT THE BUSINESS.

By *Chalon Fowls.*

When I first began raising extracted honey, fifteen or sixteen years ago, I could not sell a hundred pounds a year in my home market; now it takes from one and a half to two tons of honey a year to supply my home market, and my trade is constantly increasing. My success in building up a home market is due, I think, to my methods, which are as follows:

First the keynote of success in selling honey is to have a first-class article to sell. As nearly all the honey raised in my locality is gathered from basswood and clover, it follows that I shall have the finest-flavored and whitest honey in the market, if only the most cleanly methods are employed from the time the nectar is gathered until it reaches the market, just as a like result is obtained by the cleanest and most improved methods in the gathering and handling of maple sap. An examination of the bee under a microscope shows that it is one of the most cleanly as well as the most beautiful of insects, which insures cleanliness in the gathering process (I'm afraid the maple-sap gatherers would hardly bear comparison here). When the bee gets home with its load it must deposit it in a clean receptacle; old combs will not do, neither must the queen be allowed access to the surplus combs, as eggs, larvæ, and pollen result in dirty combs; therefore the queen is confined in the brood-chamber by means of perforated zinc.

The honey is not taken from the hive and extracted until it is sealed up just like section honey. It is then extracted, and stored in nice tin cans holding about 75 lbs. It will all candy solid, and is liquefied only as wanted for market. When I want to put up some for market I put one of the cans in a larger can, supported by a suitable frame, so as to leave room under and all around, to be filled with water. The whole thing is kept hot several hours on the stove (a gasoline-stove is the best because slower); but I do not want the water to boil at any time in the outside can. After it is perfectly liquefied it is put into my filling-can, which is provided with a gate. Then I am ready to fill small packages for market.

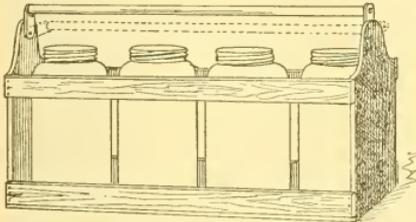

I use only flint-glass pint Mason jars and third-pint jelly tumblers for the grocery trade. I never use the green glass when I can get the flint, as the honey does not show up nearly as well. Grocers are requested to place the honey in front somewhere, or on the counter, where the light will strike through it. When a customer sees it shimmering in the sun, as clear as crystal, he is attracted by its beauty, and will buy. I want no showy-colored labels on my honey. I leave that for the glucose-mixers. They want something to plaster over their vile

---

*If you would like to have any of your friends see a specimen copy of Gleanings, make known the request on a postal, with the address or addresses, and we will, with pleasure, send them.*

stuff to *hide it*, while I want to show my honey, as it looks finer to a honey-lover than the finest work of art on a label. Lithographs are so common nowadays that people take little notice of them; but any choice article of food, put up in *clean and attractive* packages, always commands attention; therefore I use only a small white label, 1 by 2 inches, giving my name and address, and the words "Pure Honey." We might get a pointer here from the druggists, who are apt to display clear and sparkling liquids in the window.

I make a tour of the principal towns in my county every two months or oftener, according to the demands of the trade; and if any of the stock left is beginning to candy, or has become unsightly in any way, it is replaced with fresh goods free of charge. However, this very seldom happens—almost never—except in the case of some little stock that is carried over the summer.

FOWLS' HONEY-PEDDLING CASE.

"I consider it to my interest that the grocer who handles my honey shall make a good profit—20 to 30 per cent is none too much on small packages. They should be classed as "fancy groceries," and should bring a better profit than honey in bulk, or sugar and flour. In this way I secure the hearty co-operation of the grocer, which would not be the case if his profits were small.

I sell pint Mason jars at \$2.75 per doz., \$30.00 per gross; third-pints, \$1.10 per doz.; per gross, \$12.00. Pints run about 19 lbs. to the doz.; third-pints, about 6. Pints retail for 30 cts. each; third-pints from 12 to 15 cts. each, according to circumstances. But it will be argued, these prices are too high, and honey will not be used largely if these prices prevail. I answer that this is for a fancy article in small packages. Do not choice red raspberries in pint boxes sell high? and yet good fruit can be bought cheap in larger quantities, and large quantities are used too. Almost any grocer will sell on smaller margin in bulk by the crockful or pailful, as the large packages need no display, and the profit on the large package is as much as on the little one.

I believe bee-keepers ought to push the local trade more. Much might be done by advertising in one way or another. I would suggest,

Mr. Editor, that you get up some notices printed in large letters on cards, say 12 by 20 inches, to hang in stores. They might run something like this:

FOWLS' PURE HONEY FOR SALE HERE.

DON'T BUY IMITATIONS.

See that Fowls' name is on the package.

Or if a larger amount of matter is wanted, something like this might do:

FOWLS' PURE HONEY FOR SALE HERE.

*Notice to Consumers.*—Pure honey is the most healthful sweet known. Many of our modern diseases are traceable to the excessive use of cane sugars. Honey is more easily assimilated in the human stomach. This is the decision of eminent physicians. But honey, to be healthful, must be pure. Honey compounds are not healthful, and are *not cheaper*. Consumers should realize that honey that is 100 per cent pure is cheaper as well as more wholesome than a compound that only *claims* to be 50 per cent pure, even if the pure article sold for double the price of the spurious. Our pure-food laws are for our protection, and require that a formula be printed on all mixed goods.

I sell the most of the honey sold in bulk in my own town, and I find but comparatively few will buy in bulk, although the price is much cheaper. By far the larger number want only a pint or less at a time. Of course, I do not undersell the grocers on the same size of packages they handle. In soliciting orders from boarding house keepers and families I prefer to take along my samples in flint-glass Mason jars, and I carry them in a sample case which allows the light to strike through, just as in the grocery. Even amber honey from fall flowers looks fine if I can get the jars between my customers and the sun; and once people begin to admire its beauty, it's not difficult to get them to taste, which sometimes goes a long way toward making a sale. As I never allow any but my best honey to go in to the grocery trade I have to work off all my off grades to families, boarding-houses, and bakeries. The dark and strong kinds, if I have any, are used for cooking, and recipes are given away with the honey, some of which I have taken from the book "Honey as Food," advertised by the *American Bee Journal*, and some that are original with me. I have used type-written copies of recipes, but find this too much trouble, and think now I should like some printed leaflets with a few good recipes, and some extracts from Prof. Cook's article on honey as food, which appeared in the *American Bee Journal* some time ago. The reason I do not want to use the book "Honey as Food" to give to my customers is that I have found by trying that some of the recipes are worthless, and I am afraid they might try one of that kind the very first one, and then chuck the book into the stove in dis-

gust, without testing the honey for cooking any more. I inclose some of my recipes, that you are at liberty to publish if you wish. Those published in GLEANINGS are good, I know, because I tried them last winter.

It's a pleasure to know that the editor is honest and conscientious just at this time, when the politicians are stirring up strife and trying to make all the people think evil of their neighbors. The kind of honesty that thinketh no evil is quite refreshing; and so our good editor, in publishing the recipes, gave credit to the journal in which he found them, and generously added a free puff. I suppose he never "thunk" that the whole list had been purloined from the book "Honey as Food;" and the editor of the *American Bee Journal*, not to be outdone, published the same list, advertising his book, "Honey as Food," in the same column, and returned thanks for the use of his own property, and added a free puff too.

Oberlin, Ohio.

[The article above came before our honey-leaflet was gotten out. In fact, this leaflet came as the result of a suggestion from friend Fowls and one or two others.

In addition to the leaflets, it might be a good idea to have on sale cards after the style of the notice above. A neat tasty card setting forth very briefly why honey should be eaten might be read in some cases while the leaflet itself would not be read at all.—Ed.]

---

#### GRAND VALLEY, COL., AS A HONEY LOCALITY.

ALSO SOMETHING ABOUT SLEEPING OUTDOORS.

By M. A. Gill.

*Mr. Root*.—While reading your description of Salt River Valley, Ariz., I thought perhaps a few jottings from the Grand Valley in Colorado would not come amiss to the readers of GLEANINGS. First, I will say that last spring I was appointed bee-inspector for Mesa County, which gave me a good opportunity to see the resources of this valley. Your speaking of the large apiaries kept in one place in the Salt River Valley brings to my mind that I inspected nearly 600 colonies (on Mesa Creek, this county) in a scope of country not to exceed two by three miles, and only about a third of that area was in alfalfa; and right in the heart of this section I remember one apiary of 64 colonies where over 40 of them had five supers each of comb honey on them when I visited them. That night I stayed with Mr. J. P. Utterback, who has 200 colonies devoted to comb honey. You know nearly every one in this mountain region has a pack outfit (as they term it), which includes a bed. Well, after being shown the cozy spare bed in the house I noticed my friend bring out his mountain-bed and spread it on a forkful of alfalfa hay in front of the carriage-house.

"Now," said he, "if you wish you can sleep here with me."

It was during dog-days in August, at about 9 o'clock. The cool mountain air seemed to settle down the mountain sides, and lift the heated air of the valley out; and, oh! the matchless delight of drinking that pure fresh ozone is simply beyond description. It is certainly inspiring, and I imagined it was a little intoxicating.

Like you, I don't wonder these people are healthy; and, again, I *do* wonder that there are not more people whose lungs break down in the East, who sleep with their bed-rooms sealed up like a fruit-can.

You spoke of sleeping out on the ground on Dec. 29th. Well, I slept out that night too; but we had to scrape away about four inches of snow to spread our bed down. We slept well, took no cold, and why should we? Don't the doctors say that there is only one remedy that *always* agrees with every one, and that is pure ozone? I didn't have quail on toast, as you did, the next day, but I had a fine venison hanging up by 9 A. M.

You speak of some of the alfalfa honey being almost equal to the white-clover honey of the East. Didn't the committee at the St. Joseph convention decide that the first quality of alfalfa honey from the arid regions was the best in the United States? Are not you eastern fellows getting a little afraid of the quantity and quality of our honey when you put clover, willow-herb, etc., 1 cent per pound above our best alfalfa? Did it ever occur to you that we can outweigh you nearly one pound per gallon with our best alfalfa honey?

This county (Mesa) has about 4000 colonies of bees. I personally examined 3100 colonies last season. I destroyed by fire between 50 and 60, besides burning over 100 infected hives and other fixtures. I also drove quite a number of colonies back into their own hives after first saturating the inside of hive with coal oil, then burning it to a char, and giving them only V-shaped top-bars for starters.

That the honey they carry with them is digested before they can build comb and store it is proven, I think, by the fact that of all the colonies so treated only two showed signs of the return of the disease this fall. I will say I have again been appointed as inspector for the coming year, and will report to you later as to my success in stamping out the disease in this valley.

Grand Junction, Colo., Jan. 28

[Amen to your remarks about sleeping outdoors, friend G. In regard to the alfalfa honey, I have just consulted Mr. Calvert, and he says the alfalfa honey that was put a cent below willow-herb, etc., was not first-class. He says we always rank nice pure alfalfa honey fully as high as clover, willow-herb, or any other, unless it should be the water-white mountain-

sage honey that never candies, even if exposed to a zero temperature. A good deal of the alfalfa sent us has evidently been gathered when the bees were working on something else. I am glad to know of the heroic measures your people have been taking to stamp out foul brood. Permit me to say in this connection, that, so far as I can learn, foul brood has never as yet made its appearance in Salt River Valley; and I exhorted the friends there to be very careful that it never *did* by any hook or crook get a foothold.—A. I. R.]

#### THE AUSTRALIAN BLUE-GUM, OR EUCALYPTUS-TREE, IN CALIFORNIA.

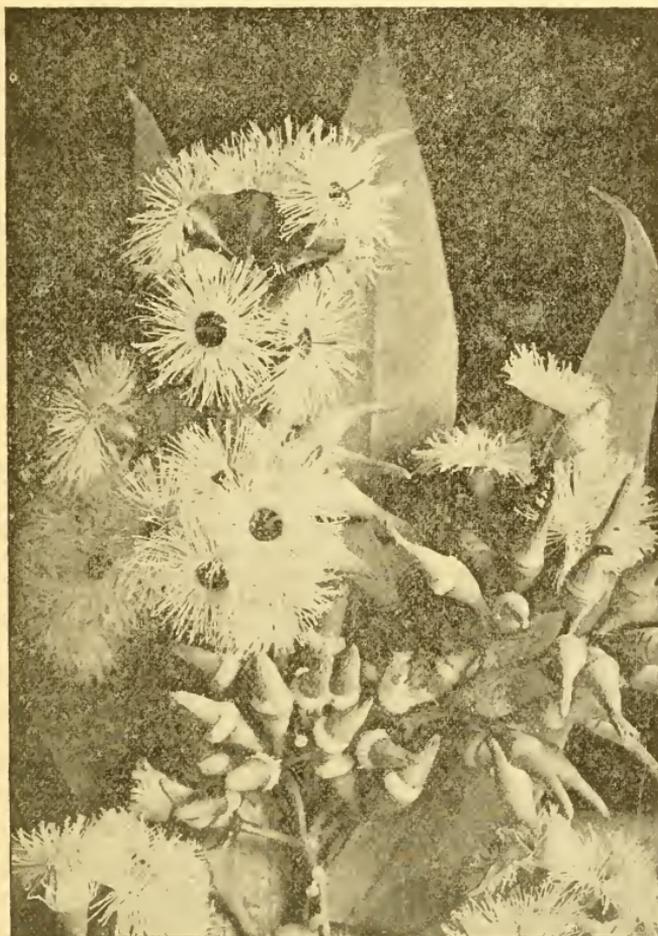

By J. H. Martin.

The above-named tree is attracting much attention on this coast as a means of increasing the honey-producing flora. The species commonly known as blue-gum was first introduced;

and, though extensively planted for wood and windbreaks, it is not an attractive tree, for its habit is of the order of a bean-pole—very tall. This species has a small flower and a profuse bloom, commencing in November, and continuing well through the winter. The honey from the blue-gum (*E. Globulus*) has an amber hue and an acrid flavor, and its only favorable feature is its value in medicinal use. There are about 150 varieties of the eucalyptus-tree. Some are noted for their variety of uses—for timber, firewood, and shade, as well as honey-production.

Under the general name of sugar-gum are several beautiful trees having a branching form, long drooping leaves, and large beautiful flowers in profusion, and possessing interesting features. The tree derives its name, eucalyptus, from the peculiarity of the flower bud—*eu*, good; *calypto*, to cover. The bud before it opens is protected by a cover. These covers are of great variety and size, and for the most part give names to the trees. In some varieties the cover is a mere disk which drops off when the blossom opens. In others the cover takes the shape of a cone, as in *E. Cornuta*. The photograph that accompanies this description was taken from the blossom of *E. Cornuta*, and shows blossom in the various stages of development. The closed bud has the appearance of a double cone. A little further along the upper cone is crowded off somewhat, showing the white filaments of the blossom ready to burst from their prison. They soon do burst forth in beauty, and the brown cone drops to the ground. The calyx develops into a hard hollowed cup; and in the early morning this cup is full of nectar, and a shake of the tree will cause a shower of nectar to descend.

This species of tree is very profuse in blossoms, blossoming sev-

EUCALYPTUS CORNUTA.

eral times annually, and it is an inspiring sight to a bee-keeper to see the bees scrambling over each other after the abundant sweets. I think the honey from this variety of gum is not so strong as that obtained from the blue gum. This tree is being largely planted at present, and in a few years we predict a marked improvement in honey-production, especially near our large towns. Nearly all species of the gum family are of rapid growth, and their chief season of bloom is during the winter months. As before stated, the blossoms are in great variety, size, and color. The general color is a creamy white; then there are others of a scarlet hue. The latter is named *E. Ficaifolia* and has the reputation of producing a honey that kills every bee that partakes of it. This charge is, however, not substantiated by good authority. The evidence is merely hearsay, and needs further investigation before we give it credence.

Bee-keepers in California should interest themselves more in the planting of honey-producing trees. Mr. N. Levering, of this city, is advocating the establishment of an arbor day by legislative enactment, just as they have already done in many Eastern States. An arbor day would be of benefit in this State, where so many wide areas are devoid of trees or even bushes. Let us plant trees, and extend our honey pasturage. Remember that the man who plants a tree causes unborn generations to rise up and bless his name.

[The eucalyptus has been spoken of many times, and very favorably, in our columns, for years back; but this is the first time we have shown a picture of the tree itself.—ED.]

---

### ALFALFA IN ARIZONA.

CONDITIONS NECESSARY FOR HONEY SECRETION; THE AMOUNT OF IRRIGATION NECESSARY; HATCH'S 70,000 LBS. OF ALFALFA HONEY.

By C. A. Hatch.

This is the honey-plant of the Salt River Valley, where most of the honey produced in the Territory comes from, and is not only a grand honey-plant but the king of forage-plants. Here in this warm country it can, with plenty of water, be mown as many as five times in a year, yielding at a single cutting from one to two tons per acre. The usual method is to mow twice, and pasture or grow seed the other crops.

The first crop, which is usually cut the last of May or first of June, does not afford much honey, although the bloom is seemingly more profuse than on later crops. It seems to be necessary for honey secretion that the bloom should be old, the same as in white clover, basswood, and perhaps other plants. The fields left for seed are the ones in which bees truly revel, the flow being, when conditions are

right, equal to the best clover, and lasting much longer; in fact, during the last year, with an exception of about two weeks, caused by rains, there would have been a continual flow from June 15 until Oct. 1, if insects had not destroyed the bloom.

It has two insect-enemies—a small three-cornered bug, green in color, and a yellow butterfly about the size of the cabbage-moth. The bug feeds on the leaves and blossoms, but I could never see that the butterfly did any thing more than suck out the honey from the blossoms left by the bugs, but presume it must feed, in the larval stage, on the roots or something near by. This season there were so many of them that it gave alfalfa-fields a golden hue, and the whole field seemed to be alive. I am sure I could have secured another 10,000 lbs. of honey this season if it had not been cut off by these two pests. The entomologist who will discover some practical remedy for them will confer a great favor on bee-keepers of Arizona.

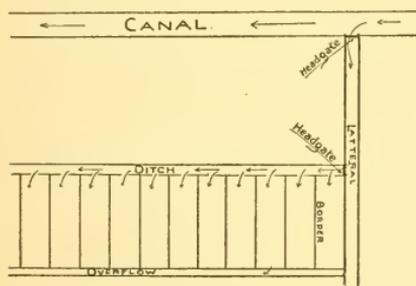

The manner of preparing the alfalfa-fields for the crop may be of interest to your readers. First it is well to remember that it is a strong grower and rank feeder, and requires a large amount of water for its development—almost twice as much as for any other crop—and is essentially an irrigation plant. It may grow, and even be profitable, without irrigation; but to bring it to the highest development, water so arranged that it can be given at any time is essential.

This whole valley (Salt River) has quite a uniform slope in one direction, of from 12 to 18 feet per mile, and seems to be especially arranged for irrigation. There are two plans of irrigation used here—"flooding," in which the water is allowed to flow over the whole surface; and "trenching," in which it is allowed to flow only in trenches, cut for the purpose, around the plants or trees to be irrigated. Flooding is used for alfalfa, barley, wheat, or any sown crop; and the other system, for fruit-trees, vegetables, strawberries, corn, etc.

Water is brought in broad ditches called canals, but these seem too small to an Eastern man to merit the name, sometimes coming 30 miles before any of the water is used. When the arable land is reached, these canals are tapped by smaller ditches called "laterals," which carry the water to the farms, where they are in turn tapped by an opening under a lock and key, which is under control of a public officer called "zanjero" (pronounced *zankero*), whose duty it is to open and close the head gate, and see that every man is getting no more than his share of water. The flow through the head gate is regulated according to the number of inches the land-owner has paid for, the price being so much per square inch; that is, what water will flow through an inch opening under a 5-inch head. One inch is counted great plenty

for an acre of alfalfa. The purchase of an inch of water entitles the owner to the use of that amount any time when the water is "on" in the canal, unless there be a general shortage; then he can get only his pro rata. In times of shortage the matter is arranged by allowing the water to run in a canal only part of the time, and allowed to accumulate or go into another canal the rest of the time. This arrangement gives each man his full flow when the water is "on."

In order to "flood" a piece of land perfectly it is self-evident that it must be nearly or quite level one way at least, and free from all inequalities of surface; otherwise, where water is left to seek its level, and soak in, some places would get too much and others not enough. So the would-be alfalfa grower must therefore smooth his land and see that the slope is uniform one way only, and that there be no inequalities in the surface. All this is done by the use of a tool called a leveler, drawn by two horses, and then the field is divided into lands about two rods wide, having a slight ridge at each side called the "borders," which are thrown up by a V-shaped tool drawn by a team along the line, and are to confine the water to the land. The dirt must be moved for some distance, for the "border," otherwise a trench would be on each side, which would draw all the water. The accompanying diagram may make the "ditch," "lateral, and "border," plainer.

Water is usually turned on once after each cutting of alfalfa; and, if well done, is sufficient for that crop. The whole field is not watered at once, but only so much as the head of water will cover, and then other lands are taken in succession. The opening from the ditch into each land is called a tapoon, and may be a wooden box with a tight-fitting slide, or only a piece of the bank removed, to be again filled when no longer needed.

The alfalfa-fields in this part of Arizona are fully stocked with bees, and in some neighborhoods overstocked. The crop last year shipped through the Bee-keepers' Association at Phoenix amounted to somewhere about 13 carloads, of which your humble servant had the good

fortune to furnish over three carloads, or 70,000 pounds.

If any one desires to locate in this country there are plenty of chances to buy bees with the location, which would be the only way advisable.

Pasadena, Cal.

#### NOTES ON GLEANINGS FOR JANUARY 15.

OVER 400 CARS OF HONEY FROM A SINGLE STATE.

By W. A. H. Gilstrap.

In Straws I see Wisconsin reported with 1,800,000 lbs. of honey, or 75 carloads, at 12 tons to the car. Yes, Mr. Editor, John H. Martin put the California crop of 1895 at over 400 cars—about 425, I think. Last year I doubt whether we produced 50 carloads. But if any other State can knock our average out, let's have a show of hands. I think we are likely to put up some large figures in extracted honey this year.

#### LIGHT-WEIGHT SECTIONS.

Go for the editor, Dr. Miller. In this country merchants usually call a  $4\frac{1}{2} \times 4\frac{1}{2} \times 1\frac{1}{2}$  section a pound, and I believe consumers generally believe them. He, therefore, *cheats* the consumer, and I more than half believe the producer who sells the honey by avoirdupois weight—16 oz. to the pound—is a party to the crime. An old peddler by me talks in favor of light weight, as he says it means "more money for less honey." That's "business."

#### GRADING.

I never heard of a half-crop of honey in this valley, that was *actually* water-white or that had sections *actually* unsoiled by bees. I hope grading-rules will not be among the impossibilities next season.

#### DEFUNCT BEE-JOURNALS.

Tell Dr. Miller to add to his list *The Western Apianian*, published at Placerville, Cal., 1889-'90, and *The California Bee-keeper* (San Francisco, I think), soon after the *Apianian* died. It lived but a short time. Mr. Israel once wrote to GLEANINGS that California bee-papers thrived until he wrote for them, and in a short time they died. I think his latest *nom de plume* is Skylark.

#### ALFALFA FOR HONEY.

Once Mr. Ball, of Nevada, gave an estimate on the amount of honey obtainable from a stated amount of alfalfa, and I thought he was imposing on the editor of GLEANINGS with something too big to be true. Since that I have learned alfalfa is very cranky as a honey-producer, and I can believe almost any thing. Mr. Alkin mentions some alfalfa traits which he would not find here. Alfalfa usually produces more honey here in rather dry localities. Where enough water is found to make the plant very

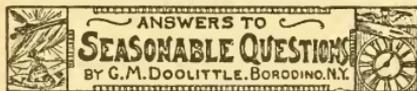

rank it is not apt to yield much honey. Most farmers in this valley cut the early crop of alfalfa usually in May, to get the fox-tail (a troublesome grass) before it fully matures. This cutting is when it is not fully in bloom, or, at least, not producing much honey. Later crops are generally left until they bloom freely and produce considerable honey before they are cut. When left for seed it is the "boss" for honey.

Last year my bees made a light run at the start. Too much electricity in the air checked honey secretion, I thought. Some light showers also made trouble. Then millions of small yellow butterflies helped empty the flowers. It is not rare for alfalfa honey to fail after Aug. 1st to 15th, in some localities.

Hanford, Cal.

[Over 400 cars of honey from a single State of this great Union! If I am correct, no other State has produced even half this amount in a single season of *any year*. These 400 cars and over, I suppose, do not take account of the quantities of honey produced in the same State, that are consumed locally. The government reports put North Carolina in the lead, and California near the end of the long list of honey-producing States. North Carolina should be near the foot. This only goes to show how grossly inaccurate government honey statistics are.

Tell the doctor to fire away; for, come to find out, we have not been shooting at *each other*, but in nearly the same direction.—Ed.]

#### BEE-PARALYSIS

*Question.*—Are you still of the same opinion regarding bee-paralysis that you were when you wrote what is found on pp. 536, 7, GLEANINGS for 1896? I see that there are very many who differ with you in their views in this matter; and I thought it possible that you might have seen something, since you wrote that article, to convince you that queens do carry the disease.

*Answer.*—In reply to the above I will say that I have seen nothing to change my mind in the least from what it was when I wrote the matter referred to. The colony I spoke of as having the queen from the colony which nearly died with bee-paralysis the year before, made about 100 lbs. of nice section honey; while her colony and the one on the old stand (the colony swarmed), having the young queen, went into winter quarters in fine condition. The one having the disease when I wrote (the worst I had ever seen at that time) gradually recovered, so that, by the middle of September, no affected bees were to be found in or about the hive; so, unless it

should break out again, my apiary is free from the disease. No one thing that I ever wrote ever brought me so many letters of censure as did that answer to the question on bee-paralysis, many apparently thinking that I really favored the shipping of queens from colonies that were known to have the disease. Some of these letters were very unfair, to say the least, and nearly every one wrote from a mistaken standpoint. When I write or speak of things I must give them as I find them, not from the standpoint of somebody else. All know that no one has proclaimed *caution* to a greater degree than has Doolittle, along all lines where caution is necessary; and I can not understand how any one could have construed any part of what I wrote regarding bee-paralysis to mean that I thought it would be safe for myself or any one else to be heedless or careless in the matter, or use queens from such colonies, for aught but experimental purposes. What I was aiming at was the headstrong way that many had in insisting that, the moment any signs of bee-paralysis were seen, the colony so showing should be eradicated from the apiary, and wiped off the face of the earth, by each and every one who saw those signs. If any person has not the time nor the disposition for a *thorough* and *careful* study of these matters, then such advice is well; but to so press matters that *no* one, no matter how careful, could look into this matter of bee-paralysis because he or she might be a queen-breeder, savored of keeping us in ignorance in the matter till the disease might so progress as to ruin our pursuit. I quite agree with the editor of this journal, that it is better to take a road a good way off from a precipice in our general driving; but if no one ever goes and carefully looks over, how can it be known that there is any precipice within a thousand miles? Neither do I believe it right for the masses to rush into a house having a case of smallpox; but that is not saying that *no* one should go into such a house, leaving its occupants to live or die as best they might, for fear some careless nurse might carry the disease to others. If you must be so careless that you are liable to spread foul brood, bee-paralysis, or any thing else, abroad, should a case of the same occur in your apiary, then by all means cremate any colony in which you find any signs of a dangerous disease; but if you can be a thorough, careful investigator, thus shedding light regarding something yet unsolved about our beloved pursuit, then go at it like a man, and don't be frightened for fear some one may score you if you stand for the right. *Don't* follow Doolittle, Root, Hutchinson, or anybody else, *blindly*, either, because they advocate something you are not familiar with; but investigate, experiment, and observe, until you *know* you are right, then go ahead, no matter what the masses may say or do.

In the world's broad field of battle,  
 In the bivouac of life,  
 Be not like dumb driven cattle—  
 Be a hero in the strife.

#### STORES FOR WINTERING.

*Question.*—In some of your writings I see that you think it does not require as much stores for wintering bees in the South as it does in extreme northern localities. What do you mean by this? Don't you think the bees will consume as much honey in the South from the middle of October to the middle of April as they would at the extreme North?

*Answer.*—Answering the last question first, I would say that I should estimate it would take more stores to carry bees from the middle of October to the middle of April, in the South, than it would at the North; but, if I remember rightly about what I wrote in this matter, I said it would take more stores to *winter* a colony where winter held as above than where we have winter for only two months, as they do at the South. After about the first of March, I understand it is *spring* in the South, while we often have six weeks of winter weather after that time. When bees begin to breed to any extent, then is when a great consumption of honey occurs; and if no honey is to be had from the fields at such times of rapid breeding, the stores in the hive are drawn upon so rapidly that starvation often occurs, when the apiarist thought his bees had sufficient stores to last for months, he judging from the consumption needed for the fall and winter months. Hence the wise apiarist has "an eye out" in this matter, from now on till the flowers give honey in the spring, unless his hives were very heavy in honey the preceding fall.

Some seem to think that mild weather, with no honey-flow, is a trying ordeal on the stores in the hive; but it depends very much on when this mild weather occurs. If in October, November, December, and January, and the bees are on their summer stands, I have found that, here in Central New York, they consume far less stores than they do in cold weather, as at this time there is no disposition toward brood-rearing, and the mild weather does not call for so much honey being used as "fuel" as does the cold. At such times, colonies outdoors consume but little more than do those in the cellar, or about a pound a month, while with cold weather the colony outdoors requires from a half more to double that amount, and this with perfect wintering. But let any colony become uneasy from any cause (go to eating voraciously) which always results in brood-rearing, and the consumption will increase, from the average, one to two pounds a month, to from five to eight pounds a month, resulting in that colony dying before spring, or its vitality becoming exhausted so that spring dwindling will be the result. When any colony becomes uneasy we call it

"sick," and many think it can not be helped. But the colony at its side remains quiet all the time, and the two were as nearly alike as two peas the preceding fall. If it is necessary that the first shall become uneasy or sick, why not in the case of the other? Who will tell us something definite about the matter?

[I am glad you have no bee-paralysis now in your apiary; but I infer if you had you would not destroy or remove it. While you would not, of course, send a queen from a diseased stock, you seem to think there is no harm in shipping queens from apparently healthy colonies, even though there may be a case of bee-paralysis in the same apiary.]

I can not help feeling, friend D., that, with the best of intentions, your position is wrong. Before me is a letter from a bee-keeper in the South, whose whole apiary of 70 colonies is diseased with bee-paralysis. It is practically a dead loss to him, and he has invested over \$400. He has tried every thing in the way of a cure, and yet the disease rages. This man claims he got the disease from a queen sent him by a queen-breeder, or at least that the disease developed in the colony soon after this queen was introduced. There are also others, whose names I do not feel at liberty to mention, who feel positive it is very contagious, and that it is almost criminal for any queen-breeder to keep, knowingly, a colony in the apiary, affected with bee-paralysis. If there is any bee-keeper in this land, friend Doolittle, who would proceed with caution, and who would be the least likely to transmit the disease from his apiary, it is yourself. But you will not forget that you have a very great influence among the bee-keeping fraternity; and perhaps some of them, less cautious than yourself, would say, "If Doolittle can do it, I can." You no doubt believe that the disease is not carried through the queen. Perhaps you are right; but if you are *not* right, and other queen-breeders who look up to you should take your position, fearful results would follow. I do not think any harm would result if you wished to experiment, provided you isolated such colonies as might have the disease; but to keep them in your general apiary, out of which you may ship bees or queens, is, to say the least, unwise.

I grant that bee-paralysis in the North occasions no alarm to the practical bee-keeper; but in the South, evidences are coming up continually, showing that it is even worse than foul brood.—Ed.]

THE DANZENBAKER SECTION; A STRONG POINT  
 IN FAVOR OF THE TALL SECTION.

I find the Danzenbaker section a great acquisition to my apiary. The tall handsome sections, nicely glazed, weighing a pound, sell readily by the case at 20 cents each, while the  $4\frac{1}{4}$  bring only 15 cents, and sell only when the tall ones are not in sight.

I find that, the nearer we come to the thickness of the brood-comb, the better they fill the sections, and the more readily they enter them.

Dealers prefer the 1½ section, whether the 4¼ or tall, and bee-keepers must cater to the demands of traders if they look for success in disposing of their product. I find the 4¼ x 4¼ section, 1½, glazed, filled, weighs a pound, and the New York retail trade demands it.

A firm to whom I applied for cartons for 1½ sections said to me, "Why don't you become an advanced bee-keeper, and adopt the *regular* 1½ or 1½ sections, so that you may obtain goods at regular prices?" I thought they needed a push toward progress. I take it that a man ready to make improvements is the *advanced* man.

Go on, dear brother, and may God strengthen your hands in all good works. "Take no heed unto the morrow." I have been young and now am old; yet have I never seen the righteous forsaken nor his seed begging bread."

B. F. ONDERDONK.

Mountain View, N. J., Dec. 9.

PETTIT'S NEW SYSTEM OF TAKING COMB HONEY.

An article in Dec. 15th GLEANINGS, by S. T. Pettit, with the above heading, was read by me with interest, and solves a problem for me over which I have pondered considerably. During the past season I have been testing 10 hives invented by T. I. Dugdale, of West Galway, N. Y., who formerly worked in the hive-factory of J. H. Nellis, of Canajoharie. This hive has the entrance in what might be called the hive-stand, and causes the bees to enter the surplus-apartment in the same way that Mr. Pettit advocates. I have been troubled a great deal to get the outer rows of sections on the Dovetailed hives properly capped; but to my surprise the outer rows of sections in the super of the new hives, although it contained 44 one-pound sections, a part of which extended beyond the 10 Langstroth frames, seemed to be just as readily filled and capped as in the center of the super. Why in such a large super the outer row of sections should be capped so much more readily than a super holding 24 sections, is made clear to me by Mr. Pettit's experiment.

I also wish to say that the article on "child-training" is a valuable one, which all parents will appreciate. Even a bear-story or a romance will give us a greater interest in our bee-journals, as "variety is the spice of life."

CHARLES STEWART.

Sammonsville, N. Y., Jan. 25.

[The plan spoken of by Mr. Pettit can be easily tried by any one who has the regular Dovetailed hive. I hope others will try the experiment, and report. It is by grasping at things of this kind that we make progress.—Ed.]

NOT TALL BUT SQUARE SECTIONS, 4¼x4¼.

You ask what we think about tall and narrow sections. My experience is that we want nothing narrower than 7-to-foot sections, and

nothing larger than 4¼x4¼. This size and width gives the best of satisfaction here. We use two tin separators to super. Wider sections are not built so well to the bottom-bar, and narrower sections are sometimes built very frail to the sides of the section. Do you see the point? Neither do we use starters more than 1½ inches deep, but full sheets of brood foundation in hive-body, every time, and wired. We want a section that weighs as nearly a pound as can be. Honey is getting too cheap to fool with ½ or ¾ lb. sections. Look out for Colorado and New Mexico. High prices on honey are over. H. F. HAGEN.

Rocky Ford, Col., Jan. 26.

COMBS ON WIRED FRAMES.

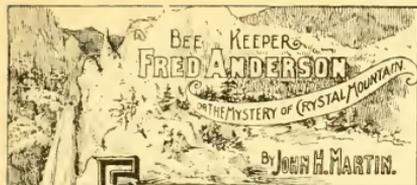

I read somewhere in the current number of GLEANINGS a report of some one, I have forgotten who, in regard to having natural combs built on wired frames. I was somewhat interested in this, as I had been thinking about the same thing myself. After thinking the matter over I made some experiments along this line the latter part of the season after the hurry of the honey season was over. I had anticipated some trouble in having such combs built so that the center or septum would come upon the wire, or that the wire would be in the center of the comb when it was finished. The result of my experiments was very gratifying. They were more perfect than I had even anticipated. On thinking the matter over I had reasoned that the bees would cluster upon the wires, and that their first work would be commenced upon the wires, thus forming the center or septum of the combs directly on the wires; and the result of my experiments afterward proved my reasoning to be correct. Although my experiments were limited to but one colony, I am satisfied that there are some gratifying possibilities for bee-keepers in this direction.

Of course, it will not be expected that combs built in this manner will compare in perfection with those built upon comb foundation; but in these days of close competition bee-keepers are looking for any methods that will economize expense; and if perfectly natural combs can be produced on wire it seems to me it must be a step in the right direction.

In this experiment I shook a colony of bees into the hive on wire frames, and fed them sugar syrup and diluted honey with a Boardman entrance feeder. I continued the experiment only far enough to satisfy myself as to its results, having the combs only partly filled. These combs I have preserved, and should be pleased to send you a sample of them if desired, as they will speak for themselves. Possibly you might think best to photograph them and present them to the readers of GLEANINGS.

East Townsend, O. H. R. BOARDMAN.

[Yes, send them on and we will show them to our readers.—Ed.]

**F**RED looked at the few colonies of bees and then at the doctor; then at the bees again.

"Charity," said the doctor, "suffereth long and is kind; is not puffed up; is not easily provoked; thinketh no evil; beareth all things, hopeth all things, endureth all things."

"Doctor, you quote my favorite passage of Scripture at an opportune moment, for I feel far from charitable."

"And why?" queried the doctor.

"Why! Well, then, the idea, doctor, of my coming up here into these lonely mountains to take charge of only ten colonies of bees when I expected to manipulate a large apiary!"

"I don't remember of telling you that I had a large apiary," said the doctor. "If I did, I beg pardon; for it was far from me to convey an erroneous impression. Besides, Fred, what difference does it make whether I have ten colonies or five hundred if you get your pay for your labor? The pay will certainly be the same for the few as the many."

"I know our agreement is to that effect; but I hardly see how I can keep busy at present upon ten colonies of bees; and unless I have something to do, I—doctor, I'll—I'll fly—I'll be that nervous, you see. But must I consider all of your learned talk as merely theoretical management?"

"Largely, largely," replied the doctor; "but I have talked with you enough to know that you are a practical bee man, and it is our duty now to make the practical match the theoretical. There are ten colonies of bees before us. Now, not only theory but practice tells us that, in a good honey-flow, a colony of bees having a prolific queen can be safely divided every two months, or even oftener. These colonies have ten frames, eight of them filled with brood. When the colony is in condition to divide I insert a tin division in the center of the hive, equalize the hatching brood, secure the queen in one compartment, and introduce a queen to the queenless part. When the new queen is accepted, and the bees get equalized, I take out half the frames and bees and place them in a new hive beside the old one. If this operation is performed carefully, there will be no massing of bees into one hive to the depletion of the

other, for both have queens. I use division-boards in the new colonies, and insert frames of foundation as fast as they are drawn out. The result is, that on an average the division can be performed every two months, the year round, in this valley. You can readily figure what this will amount to. Doubling these ten colonies every two months results in 640 colonies at the close of the year, or 40,960 at the end of the second year. There may be a few failures in queens, and we will call it an even 40,000."

"Let me see," said Fred, as he took out his pencil and began to figure. "At that ratio we should have at the end of the third year, say, barring out the worthless queens, 2,000,000 colonies of bees."

"That is it," said the doctor; "you see there is plenty of work ahead if you only keep everlastingly at it."

"But, doctor, you do not really mean to increase so rapidly?"

"Only the first year," replied the doctor; "500 or 600 will be about all my field will at present bear; and, although I hate to think of it, I hope to open this valley to the public some time; then the rearing of bees for sale will be its profitable feature."

"Why, doctor, it would be necessary to run a railroad up here to accommodate a bee-ranch upon such a grand scale."

"That is coming in good time," said the doctor. "A new line from Ukiah to Humboldt Co. will pass within a mile of us."

The doctor now secured a smoker and two veils from a neat box used for that purpose, and they proceeded to investigate the interior of the hives; and, though their exterior was roughly made, and unpainted, the interior was fitted with the latest improved Hoffman frames.

"Why, doctor, your bees are the finest I ever saw," said Fred, with the eye of a critic.

"Yes, sir, and I want to show you a theoretical queen."

The doctor held up a frame, and they both looked for the queen.

"There she goes," said Fred, "through that opening," pointing his finger toward the spot; "but, my! she is a beauty, and so large!"

Thus they examined all of the hives; the bees were large and gentle, queens such as Fred had never seen, and new honey was coming in freely so late in the season that Fred was full of exclamations: and under them the doctor's face wore a pleased expression.

"Your queens are so fine, doctor, that I am anxious to know how you reared them."

"Well, then, I will briefly say that I have the same theory in relation to the breeding of queens that is put into practice in the breeding of horses. Perhaps you know that California horses beat the world for speed and other

qualities. The results are from breeding for a series of years in locations noted for a high and uniform temperature. Now, I have applied the same principles to the breeding of queens. For four years I have been experimenting; and by keeping my breeding-hives at a high and uniform temperature I have attained the results you have witnessed in the hives."

"Doctor, you say a high and uniform temperature; what do you call a high temperature, and how do you keep it uniform?"

"I find," replied the doctor, "that, for queen-rearing, 101 degrees brings the best results, and with the hot sulphur water, as it flows from the springs, there is no change of temperature; and, taking it at a point where it is cooled down to 101 degrees, and there placing my queen-rearing hives, you observe I can keep a uniform temperature both night and day. I tell you it is of the utmost importance."

"THEY EXAMINED ALL OF THE HIVES."

"What strain of bees did you commence breeding from?" queried Fred.

"I imported an Italian queen through the A. I. Root Co., and then I reared drones from a native strain. It has taken much labor and weeding-out. Within the past four years I have reared hundreds of queens, and the ten you saw are only the survival of the fittest, and I guarantee they are the finest in the world."

"I think so too," said Fred, "and it is not right to hide their value much longer in this valley. Why, doctor, you have a fortune just in the matter of queen-rearing in this valley."

"Possibly," replied the doctor; and, mounting his donkey, he said, "I think we have talked bees long enough for to-day. We will now return to camp by way of this terrace and the

Wis-ton-we; then we shall have seen about all of the prominent features of the valley. But, Fred, you can live here a lifetime and still find something new and interesting to admire."

"Much upon the plan of the botanist," said Fred, "who, putting his hand down upon the grassy lawn, said that under his hand there was enough material upon which to spend a lifetime of study."

"Yes, in comparison to the great world this little valley is but a trifling affair. But, Fred, trifling affairs sometimes make a great stir in the world. But, now, 'faint sounds the tinkling of the waterfall,'" quoted the doctor, as they approached the upper end of the valley. "The Wis-ton-we is an ever agreeable companion."

As the donkeys carried them safely down a steep grade, Fred espied the long glassy chute in the face of the cliff, through which he had been sent, or initiated, into the valley.

"There, doctor, I came near losing my senses in that thing; and until Sam explained the matter I was very angry at you. I was fighting mad, I tell you."

"Charity," said the doctor, "suffereth long and is kind; thinketh no evil; endureth all things."

After inspecting the peculiar elevator with its rude rawhide water-balance and rude mechanism, they returned to the doctor's cabin.

"I think you now have a very good idea of the valley," said the doctor, "and will need no chaperon to accompany you."

"Yes, doctor, and I think I will take a run down to the sulphur springs and take a bath."

Fred thoroughly enjoyed all he saw that day; and, after a prolonged bath, he felt much refreshed.

The evening shadows began to gather before his return; and as he followed the winding pathway up stream he heard Sam's voice echoing down the valley:

"H-o-o, h-o-o! all ye! h-o-o! eberybody h-o-o! Come dis way! h-o-o! de coffee am a bilin'; de hoe cake am a spilin'! h-o-o! h-o-o! all hans roun for supper! h-o-o-o!"

Fred stopped to hear the music of that simple call; and as the echoes died away in the crags above he exclaimed: "I declare, if those negroes are not always musical. Perhaps it is because I am hungry: but that is the most artistic call to dinner I ever heard."

The doctor wished to make more extensive preparations for queen-rearing, and their conversation by night and by day was queens and bees. The rest of the week they were busy in the shop, talking, planning, and working; the-

ory and practice came in conflict quite often, but were usually settled upon the practical side.

Late Saturday evening, when the doctor bade Fred good-night, he said, "I must go out to the rancharia to-night. You and Sam will have the valley all to yourselves over Sunday."

The doctor was expected back before Monday morning; but Fred and Sam were left in an increasing degree of wonderment until Wednesday morning, when the doctor did return. At the breakfast-table he was disposed to be silent, and appeared much depressed. When they arose from the table he picked up his felt hat and said, as he held it up, "That was a sound hat when I went out Saturday night; now there are holes through the crown. Those were made by a bullet while the hat was on my head."

"Dat's what I call hewin' close to de line," said Sam; "for gracious, if de lead'd come so near my head, ebry kink in my wool 'ud been straightened, suah."

"Why, doctor, have you such enemies outside?" asked Fred. "That was certainly a close call."

"Yes," replied the doctor; "there are enemies without. Sit down again and I will tell you. You have not lived long enough in this western country to have learned the peculiar tactics of the land-grabber. He takes up a government claim of 160 acres, and then holds the several thousand acres adjacent by bulldozing off every would-be settler. If the settler is obstinate his stock is usually stampeded or mutilated. If he still persists in holding his claim, a bullet ends his career, and the land-grabber is monarch of all he surveys until another victim appears. In these remote parts the murderer escapes punishment, from the fact that the murder is not even investigated. There is such a land-grabber just over the mountains from us. Another murder was committed on his domain. In this case the murdered man had a spirited son, and, having heard of the mysterious man of the mountains, at the instigation of Mr. Landgrabber he was upon the watch for me, and that explains the bullet-holes. There are so many intricate and even dangerous passes around this mountain that I easily slipped away from my pursuers. Now, if I mistake not, this young man, if he persists in holding his father's claim, will, in due time, join his father in the spirit-land, and his taking-off will be laid to the mysterious man of Crystal Mountain."

"But, doctor, why don't you go right out and clear up this matter?"

"I fear, Fred, that there has been so much evil laid to me, that, should I appear openly, I should be shot on sight. I feel that, by and by, something will turn up to relieve me. Meanwhile I must stay in the valley and work out my destiny."

Secure in the hidden valley the doctor and Fred pursued their planning and work with the bees, and in a few weeks the episode was well nigh forgotten. Fred found the little apiary of ten colonies, which he at first despised, a center of great preparations for larger operations. The doctor had for some months been laying in a stock of supplies, and had enough for all present needs; but, even after it became dangerous for him to go outside the valley, his Indian allies, who roamed the country at will, brought him such small things as he needed.

Preparations for increasing the bees were not completed until the first of January. When every thing was in readiness the work went forward with much precision. Fred was delighted at the ease with which the divisions were accomplished, and said they could be done every six weeks. But the doctor said there was some uncertainty about it; and as two months' time was safe, and fast enough, they would stick to that.

As the months passed, Fred thought many times of his outside friends; and when working alone his mind was constantly upon Alfaretta. Many talks he had with the doctor upon her mental trouble. The doctor was always deeply interested, and would often say, in an absent-minded way, "Buell—Buell! If that name were only Bull—any way, I shall investigate that matter the next time I go to Sacramento."

Fred had been in the valley well toward a year; had made the fifth division of the bees, and was now the proud manager of 300 colonies.

Matters in the valley were moving along in their usual channel, when, one evening as they were about to retire, two Indians came into the valley in a much perturbed state of mind, took the doctor aside, and, after a hasty consultation, he departed with them. Fred and Sam sat for a long time speculating upon the unusual occurrence, and both fervently hoped the doctor would not again fall into the hands of the land-grabbers. The doctor not returning, they both at a late hour retired. Before sleeping, Fred's last thoughts and last little prayer were for the welfare of Alfaretta; and with her name this night he included the doctor; but he slept very lightly, and dreamed again of the night episode with Dawson, and saw again the white apparition on the stump. "I declare," said he, as he awoke, "how real that did appear!"

Again he slept, and dreamed; and as the streaks of dawn were breaking in the east he again awoke; and, sitting up, he said, in an undertone, "What a vivid dream! I thought I heard her singing."

Then to his astonished senses came the strong clear tones:

The night is stormy and dark,  
My lover is on the sea;  
Oh let me to the night winds hark  
And hear what they say to me.

MR. B. K. S. BENNETT, editor of the *Pacific Bee Journal*, who published some reflections upon the character of one of California's prominent bee-keepers, Mr. Geo. W. Brodbeck, reference to which has already been made in our columns, has, in his January number, published a retraction expressing his regrets, as Mr. B. is willing to forgive and forget. We are glad to announce this happy termination.

#### THE NEW DRAWN FOUNDATION.

WE are receiving quite a number of testimonials expressing appreciation and surprise at the success we have achieved in producing the new article. Here is a sample of how a bee-keeper who not only knows what he is talking about, but who is well known to the whole fraternity, writes:

The sample of drawn comb is this day at hand. Thank you. I must say that it exceeds my expectations, and I predict great things for it if it can be put on the market at a reasonable price. I have had considerable experience with combs, and know their value.

E. T. FLANAGAN.

Bellevue, Ill., Feb. 22.

#### LOW PRICES ON HONEY, AND WHY.

It will be noted in another column that California produced in one year about 425 carloads of honey, not including small amounts consumed locally. Arizona and Colorado are coming up rapidly to the front as honey-producing States; and one of the bee-keepers wrote the other day, "Look out for Colorado when our honey gets on your eastern markets." With continuous honey-flows from three to six months, is it any wonder that our western brethren can produce honey cheaply? Of course, the West has to contend with the freights; but even then, with their 600 or 700 cars of honey that is liable to appear at some seasons of the year, it is not much wonder that prices have had to drop some. We are in hopes that the new comb will help bee-keepers produce honey more cheaply. We shall see. One thing, however, is very gratifying. The fact that such vast amounts are produced and consumed yearly, shows that honey is coming to be more and more a staple article somewhere; for it is practically certain that no such amount could have been carried twenty years ago, even in proportion to the population at that time.

#### THE NEW HOFFMAN FRAME, AND JULIUS HOFFMAN.

SOME days ago we received a letter from Mr. Julius Hoffman, after whom the Hoffman frames were named. Here is what he says:

Mr. Root:—I have noticed in GLEANINGS, page 94, that you are doing your best to improve the Hoffman frame, and think the change will be a success. As for me, I still use and make it as I had it at first,

but make hive and frame  $1\frac{1}{2}$  in. shallower than before, as I now raise comb honey principally. I am wintering 800 colonies. They seem to winter excellently.

JULIUS HOFFMAN.

Canajoharie, N. Y., Feb. 11.

Mr. Hoffman has for a good many years, in effect, secured the same results that we sought to obtain as set forth on page 94; namely, preventing the end-sticking of the top-bars. He long realized the necessity of keeping these intact, but he does it in an entirely different way. The hive-rabbets are shallow and narrow, and the frames come flush with the top of the hive. The ends of the top-bars are widened the same as the end-bars, and are entirely covered, so that the bees can not get at them to chink in propolis. But the general construction of the Dovetailed hive, or any hive based on Langstroth dimensions, made it necessary to depart from the original Hoffman somewhat.

Eight hundred colonies in winter quarters! Well, that is the kind of bee-keeper Mr. Hoffman is. The fact that he was so extensively engaged in bee-keeping, and that his appliances worked so well, led us to believe that he was a safe man to follow, and we did. The consequence is, we have pushed the Hoffman frame so that it is now used very largely all over the United States, when formerly it was used only in certain sections of New York.

#### APIS DORSATA AT THE LINCOLN CONVENTION.

ONE of our cotemporaries, in criticising the action of the Lincoln convention regarding *Apis dorsata*, jumped to the conclusion that it was at the instigation of a so called "ring," made up of Drs. Miller and Mason, and York and the Roots. This is what the editor of the *Nebraska Bee keeper* says on the subject.

I have been reading with some interest the discussion, pro and con, of the action of the Lincoln convention in regard to the importation of *Apis dorsata*. Now, I wish to say that I think but one or two gentlemen know that such a resolution was thought of until I read it and moved its adoption. As to the why I feel opposed to the importation of *Apis dorsata* by the general government at this time and in the manner asked for by the Ontario County Bee-keepers' Association, I will say:

First, I do not think it is a bee that would do us any good. A score of years ago we had in our employ a bright young man. A year or so later found him on his way as a missionary to Africa. Three or four more years pass along and he revisits his boyhood home and parents in our town. While here he described animals, insects, and bees, as found in that far-off land. Although not particularly interested in *Apis dorsata* at that time, yet from his descriptions, and those read later, I think they may be identical, or nearly so, and I at present believe worthless to us, other than as curiosities. \* \* \*

Now, gentlemen, instead of growing, and throwing stones and slurs at "Root, Miller, York, or Mason," who did not introduce the resolution at the Lincoln convention, throw them at some one out in the Pacific Ocean. If Root or Miller or York had needed *Apis dorsata* in their aparies, like gentlemen they would have inclosed a \$10 bill with a well-provisioned queen-cage to some agent or missionary in far-away lands, and had *Apis dorsata* queens to sell to their customers before the government agent could pack his gripsack ready to start. Whenever we have learned that *Apis dorsata* is any thing desirable it will get here.

[I] wish all of our bee-keeping friends could not only hear but see Mr. Whitcomb give expression

to the above sentiments. □ If you could feel his personality once, and understand his good-natured sparkle, you would no more think of throwing "stones" at him than you would at your grandmother.

"COMMERCIAL RATINGS."

On page 72 of the *American Bee Journal* for Jan. 28, we find the following severe criticism in regard to the way commercial ratings are made:

"What a contemptible system it is, though! Now, suppose I had been an enemy of this man, what an opportunity to have ruined his reputation! On the other hand, had I been his most zealous friend, here was a chance for me to give him a high but false rating."

After having had many years of business experience with both Dun and Bradstreet, I want to make a little protest to the above. No doubt they sometimes get a report from a person who is prejudiced against somebody in his own town; but I am sure they recognize the possibility of this, and take great pains to avoid injustice. For instance, sometimes it is hard to get at once the exact facts in the case; additional facts follow sometimes for several weeks or months. The additional facts from some other standpoint usually corroborate the first one, but sometimes they present the matter in a different light. Again, we assist these agencies in keeping track of people connected with bee culture. Sometimes they think we have been a little too severe, or may be the reverse; and they often go to much pains and expense in order to get at a fair and impartial rating of the person. A few times I have known them to be misled; but I am sure such cases are the exception and not the rule. We are continually asked in regard to the standing of certain people; and where a stamp has been inclosed I have always felt it a pleasure to help business along by giving a recommendation to any worthy man, or in cautioning about giving improper credit to the unworthy.

A. I. R.

USING WIRE STAPLES OR SIMILAR DEVICES  
FOR SPACING FRAMES; A. I. R.'S  
RECOLLECTIONS.

In the earlier volumes of the *American Bee Journal* this matter was discussed pro and con at such length that our good editor, Samuel Wagner, finally shut down on the discussion. Nails were suggested; blind-staples, and projections of wood, not only from the top-bar but end-bars. At that time I was using H. A. King's American hive, and advocated projections to hold the frames in place when the hives were to be moved. The editor suggested something like this: "The movable frames as given us by Langstroth can be moved near together or put far apart as you may choose. In using the fingers of the hand we sometimes want them close together. Again, we want them apart more or less. Is not this much better than to have them spaced at fixed distances?" About

this time, or earlier, Ransom & Cobb, of Cleveland, who manufactured Langstroth hives, fitted the frames all with wire staples driven at a certain point and depth. When the extractor came into use, a good many bee-keepers complained that these staples dulled their honey-knives. They caught against the ends of the hives in putting the frames back in place, and finally most bee-keepers decided to go to work and pull out the wire staples, nails, and ever so many other fixtures that had been attached to the frames to help this spacing business. When it was first suggested, a great many bee-keepers went to the trouble of putting staples, or something equivalent, into their frames clear through some large apiaries. Well, if I am correct, nearly every one who did this, sooner or later went to work and pulled them all out. There was no end of spacing-devices—staples, tacks, nails, folded bits of tin, or sheet iron, and pieces of wood tacked on where they seemed to be needed. Years later, when out-ariaries began to be so much in vogue, the Hoffman frame was introduced, and seemed to find a permanent place. This frame, with recent improvements, has several advantages that none of the early experiments right along in this line seemed to include.

It is said that history repeats itself. The frames with staples as *side-spacers*, as friend Boomhower uses them, were not popular. Why, then, should they be popular again? Hoffman frames, although discarded by individuals, have been used for perhaps twenty years, and they increase in popularity.

A. I. R.

---

THE LINDEN.

I come with a song for a tree near my cottage—  
A treasure God placed in his own garden-bed;  
A tree which has stood while my wife and my children

Grew sweet as the creamy-white blossoms o'er-head.

Around it the giants of nature are standing—  
The oak and the walnut—primeval and grand;  
But nothing in forest or field can compare with  
The linden in whose cooling presence I stand.

When suns of mid-summer are hot and oppressive  
We keep our noon-trysting beneath its deep shade;  
Its emerald roof gives a promise of shelter

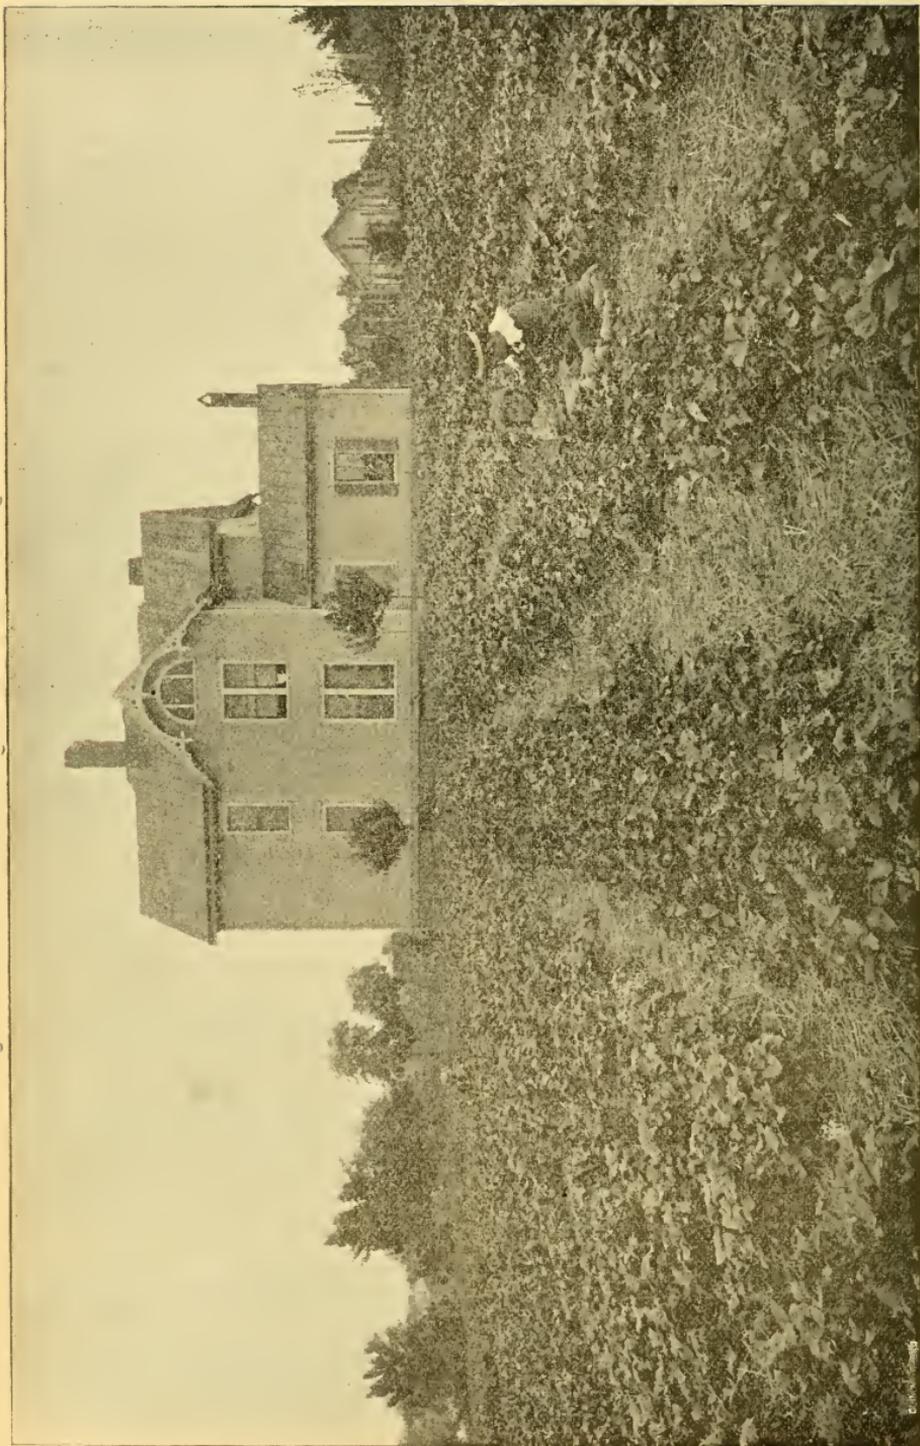

From fiery old Phoebus when scorching the glade.  
The catbird and robin have left the ripe berries,  
To rest in the boughs of my favorite tree;

They'll give me a song for the fruit which they pilfered,  
And evening shall witness a bird-jubilee.

How charming to me is the music created  
By swift-flying bees when exploring its bloom!  
My dreamy repose as I swing in my hammock  
Is often enriched by its grateful perfume.

Oh sing not to me of blest Araby's odors—  
Of spices and incense from tropical seas!  
But waft to my senses the fragrance of linden  
Exhaled by the breath of the home-coming bees.

—Eugene Secor.

A MODEL STRAWBERRY-PATCH GROWN EXACTLY AFTER THE DIRECTIONS GIVEN BY T. B. TERRY IN HIS STRAWBERRY-BOOK.

## GROWING STRAWBERRIES ACCORDING TO OUR STRAWBERRY-BOOK.

WHAT AN AMATEUR DID THE VERY FIRST TIME AFTER HAVING DIRECTIONS FROM THE BOOK TO GO BY.

I send you a picture of my strawberry-bed. I have tried to raise them several times, but without success. I finally sent for your book on strawberries, and went as nearly as possible by the directions in the book. I put in a small bed and had good success. We sold nearly a hundred dollars' worth besides all we could eat. I am only an amateur. I have the Sharpless, Crescent, Haverland, and Gandy. I forgot to mention that, while everybody else's strawberries were a failure in this locality on account of drouth this year, ours were a success. You can see in the picture we send that Master Verner S. is as fond of *eating* berries as he is of *picking* them. J. L. SCHLEGEL.

Richmond, Ky.

It is very seldom we get a photo of a nice strawberry-bed of sufficient accuracy to show the foliage and the berries. Our good friend Schlegel owes his success largely to the fact that he is a photographer as well as strawberry-grower. The ground was put in order, probably, exactly according to Terry's directions; that is, by turning under a heavy growth of clover for the berries to grow on, the ground being, of course, duly enriched, that the clover might make a great rank growth. After the clover is turned under, and the ground worked up fine, and firmed, then the rows are laid out 4 feet apart, and the plants set out early in the spring. Then the runners were trained so as to have the plants evenly spaced all over the ground, leaving only sufficient space in the paths to walk between the plants.

During the first winter the plants were mulched with plenty of straw between the rows, and with cut straw between the plants; then during the heaviest freezing weather just enough straw was put over all to conceal the green leaves. When frosts were past so the plants began to grow, this surplus straw over the plants was pushed aside just enough to let the green leaves come out through them. Spring rains do the rest in the way of packing the straw down out of the way. The beds were kept so clean that not a weed nor even a spear of grass is visible through the luxuriant foliage. Friend S. has evidently carried out the plan to the letter, and every thing is just right. No wonder he sold a hundred dollars' worth from what he calls a "small bed." I am sorry he did not tell us just how much ground he did have.

Now it is not too late, dear friends, to get *your own* strawberry patch into similar trim, or at least partly so. As soon as the snow goes off, and the ground is soft, get out every weed and spear of grass. If you have not put on the necessary mulching, get at it right away as soon as the snow is gone and the ground is not frozen. Nobody wants muddy berries. They must be kept clean; and straw mulching, or mulching of something else, is about the only way to do it. We use to a large extent coarse stable manure. We can get this at about the price of straw. Of course, it is open to the objection of weed seeds that will probably spring up and bother you before the berries are picked. If, however, you do not expect to run your strawberry-bed another season, you may let it get pretty weedy while you are picking the last of the berries; but do not let any of these weeds go to seed; and just as soon as you decide there are not enough berries left for another picking, plow the whole thing under—weeds, stable manure, strawberry-plants, and every thing

else. Then put in cabbage-plants, potatoes, or any thing else you happen to want on the turned-under strawberry-bed, and then you will have a crop for certain—that is, if the strawberries were manured as every strawberry-bed ought to be.

### THE SODA SPRINGS NEAR ROBERT PHINNEY'S.

Along with the water, every now and then there arose a great bubble of some kind of gas. This gas is probably carbonic acid, although I did not have time to test it. The spring water is so strongly charged with gas as to give it quite a pungent taste—something like the effervescing springs of Manitou. It is so strongly impregnated with soda, however, that one does not want to drink very much of it. There are toward a dozen springs scattered along over perhaps half an acre, and the water collectively makes quite a good-sized little stream. It is so warm that on a frosty morning quite a fog hangs over the neighborhood of the springs, and follows the stream of water for quite a distance. The water is warm enough for a comfortable bath; and if one or more of the springs were inclosed even in a canvas tent it would be a rare bathing-place. I have been told by those who have tried it that it seems almost impossible to sink in the water, as it seems to buoy or push you up. This is probably caused both by chemicals contained in the water and by the force with which it pushes up through the boiling sand. No doubt these springs possess medical properties (that is, if any of the warm or hot springs do, aside from the matter of temperature); but it is so far away from everybody that there is not much prospect of their being developed very soon. In this neighborhood they have mail only once a week. How does that sound, friends, to those of you who live in towns where you have mails out and in, three or four times a day?

Next morning we made a trip still further up into the mountains. We crossed the beautiful clear Beaver Creek spring water several times, past the schoolhouse where Mrs. Phinney was teaching; and finally away up in a narrow canyon in the mountains we came to the residence of R. Cassner. Before reaching the place, however, I was charmed by a little babbling brook coming up out of the canyon, and actually running up hill—that is, if I took my eyes for evidence. It seemed to run up hill right merrily, too, for it babbled and flashed in the sunlight, and hurried along as if it had lots to do and could not waste a minute. Its final destination was an alfalfa field, where it spread its liquid treasures over the green and growing plants. We followed the stream until it came clear up to the door of the house. In fact, you could hardly get outdoors and in without jumping over it. A party of dogs met us at the bars, and barked so loud and long that the people could hardly make themselves heard when they tried to welcome us. I couldn't quite make out whether the dogs wanted to eat us up or whether they were simply manifesting their pleasure at seeing visitors.

Right back of the Cassner cabin is a mountain so nearly straight up for almost a whole half-mile that it makes your head swim; and away up under the very crest of the table-lands on top we saw some cliff dwellings. While

friends Elvey and Carey took their guns and went off for a hunt, I visited friend Cassner's garden and fruit-orchards, all of which are kept booming under the influence of this babbling brook. The growth of apple-trees, apricots, peach, pear, cherry, and every thing else up in these mountains, is absolutely wonderful. Let me give you some figures. I was shown one apricot-tree that had yielded \$50 00 worth of fruit during the past season; one Ben Davis apple-tree only nine years old, the fruit from which brought \$25.00 during the past season. Four peach-trees bore a ton of peaches. In the garden, eight rows of peppers, each row 30 steps long, yielded \$50 00 worth of peppers, and they were sold at 10 cts. per lb. Now, one secret of the large amounts received is, that almost all kinds of fruit brought at Flagstaff and Jerome 8 or 10 cts. per lb. The owner says he received about \$1500 from the fruit grown on four or five acres right around his little home.

Now, before you all get the fever for moving out on some of these mountain canyons to get rich raising fruit, let me tell you that this fruit had to be all hauled over mountain roads from 30 to 50 miles. There are nine children in the Cassner home; and, as nearly as I can make out, pretty much all of the nine were busy during fruit time, gathering fruit and getting it to the city markets. I know the prices mentioned are not very much out of the way, because while I was present in one of the mining towns a little girl came in and said her ma wanted 50 cents' worth of apples. Now, if a customer should give me such an order I should want a stout man with a wheelbarrow to deliver the 50 cents' worth. Not so in this case. The storekeeper put the few apples into a common tin grocery-scoop. He weighed them up as he would tea and coffee, put them into a paper bag, and the little girl carried them home without very much trouble. She got 5 lbs. of apples for her half-dollar. Why not ship apples into these mining towns, from the East? Well, it is the old story of the awful freights. In one of these mining towns they tell a story of a peddler who wanted 5 cts. apiece for some sewing-needles. When his customer remonstrated he said it was as low as they could possibly be sold, on account of the expense of shipping so far over the mountains!

Now, there is something exceedingly strange about these mountain-canyon homes. I supposed I had seen all of the fruit-orchards; but my comrade said he had another nice little strip of orchard over there by the creek.

"But," said I, "there is no room for an orchard. On the further side there are the rocky cliffs close up to the water, and we have already seen every thing there is on this side."

"Oh!" said he, "you will find quite a little strip of wonderfully nice ground when we get there."

And when we did "get there," sure enough, there it was. After we had seen the fruit-trees with their wonderfully luxuriant growth, we sat down by the door and tasted some of the beautiful apples. Although it was in the month of January, they were as crisp and delicious as any apple I ever tasted picked right from the tree. In fact, it seemed that day as if they were the handsomest and most luscious apples I had ever tasted in my life. I did not wonder then so much that people were willing to give 10 cts. per lb. for them.

I expressed a wish to see the wonderful spring where this babbling brook came out of the mountain-side. All the time it looked to me exactly as if we were walking down hill while the brook was running up hill to meet us. It looked down hill; but when I tried to walk I

could not get along as easily as one does in going down hill in reality. The spring came out of the rocky mountain in several places, making the moss, grass, and other vegetation grow with wonderful luxuriance wherever it layed them with its magic touch. The banks to keep the irrigating water within bounds are sometimes very frail, and, it seemed to me, insecure. But everybody has learned to be careful. If in jumping across the brook you should put your foot on the soft edge of the bank, you might let all the water get away in a hurry; but, as I have said, every one learns to be careful.

After I had finished my visit I jumped on my wheel and rode along beside the babbling brook. Oh, yes! sure enough, the wheel tells very quickly which way is down hill and which is up. Hills that looked too steep to climb up in going one direction were surmounted without any effort at all; but if you are going the other way, a hill that seemed very moderate to the eye would make you puff and blow till you decided to give it up and walk. I can not tell why these mountain canyons confuse one's ordinary judgment in this matter of up hill and down. There is something weird and enchanting about the whole matter. Mr. Cassner has the last dwelling-place up in the canyon. In fact, the road ends at his little plantation. I suppose there are hundreds of other places where wonderful results could be accomplished in the way of gardening and fruit-growing; but the great trouble at present is the enormous expense of getting your produce to market.

---

## OUR HOMES.

---

Who forgiveth all thine iniquities; who healeth all thy diseases; who redeemeth thy life from destruction; who crowneth thee with lovingkindness and tender mercies.—PSALM 103:3, 4. †

I returned from my western trip so as to reach home Saturday morning, Jan. 16. Several had cautioned me about going north right in the depth of the winter, especially in regard to the sudden transition from a warm or tropical climate to the cold Ohio winters. Saturday was a rather mild day for January, and I went all around home looking after things, feeling about as well as usual. Sunday morning I discovered I had taken cold. I went to church in the morning, but on the way home I felt pretty well satisfied that something was the matter. Next day a doctor was called, and he said my old trouble, malarial fever, had got hold of me, together with a very severe cold. He said I should have to keep warm, and not even look out of doors. He did not tell me my disease was grip; but from what I had heard of it I decided it must be "grip" for sure. At any rate, some tremendous thing was *gripping* at my vitals in a way I believe I had never experienced before. By the time our blizzard got along, 16 degrees below zero, I felt pretty sick. I do not know what gave me such a terrible cold unless it was the sudden transition. I was whirled from New Orleans up to my home here in Northern Ohio in just about 26 hours, thanks to the L. & N. R. I was well bundled up, and can not understand even now just how or why I caught such a cold; but I do know that, in a few brief days, my physical strength and energy seemed entirely gone, and I felt astonished to find my spiritual life also dwindling away, as it were. I remember of feeling strongly impressed that a sick-bed was not the best place in the world for one to make his peace

with God. For a little time I felt almost too sick to breathe even to myself that old familiar "Lord, help." I employed the same physician who treated Mrs. Root; and in about a week he said my fever was broken, but that I should have to be careful, and not be surprised if it took me a *good while* to regain my appetite, strength, and energy; and it was just about four weeks from the time I was taken down before I ventured to step outdoors.

I suppose others have had a like experience to my own. The idea *would* keep getting into my feverish brain that my work on earth was done, and that I was too rickety and broken down to think of any thing regarding the future. In fact, it seemed to tire me to think or even to live. As usual, Satan suggested that it would be a fine thing *not* to live. I remember one feverish night, while I was suffering, the idea some way got into my mind that death was not going to give me any relief, for I should soon get awfully tired of *being dead*. So I rejected Satan's suggestions. And, by the way, I am inclined to think there is a great truth somewhere along in this line.

Within the past year there seems to have been almost a mania for suicides. Somebody has called it an epidemic of suicides. Now, if some of these poor deluded victims of Satan do not get "tired of being dead," or, in other words, if they have not already discovered that they have made a terrible blunder, then I am mistaken. Some have chosen death rather than face the consequences of having their criminal proceedings brought to light. They seemed to think that in death, and a self-inflicted death, they will find a refuge. I feel *sure* they have made a mistake.

As I began to recover from the effects of the fever, and my brain began to get clearer, I remember a good many times, especially while suffering, that I prayed very earnestly that God would not only give me health, but that he would give me wisdom that I might advise and direct others in this matter of caring for these bodies of ours. By the way, I think I shall have to confess that I seldom pray with much earnestness unless I am in trouble of some sort. If this is true of all of us, dear Christian friends, we ought to be careful how we murmur or complain of sickness and pain, or trouble of any sort. For a time it seemed as if my prayers were not heeded. But I have had too many similar experiences to lose faith, and I knew that the great Father *would* in his own good time give me light amid the darkness. Our text has it exactly: "Who forgiveth all thine iniquities, who healeth all thy diseases." Not only that, but in the next verse we have, "Who redeemeth thy life from destruction." Without faith in God, the inevitable conclusion would be that I was going to destruction. I do not know whether other people are beset by similar despondent feelings like my own or not. I remember of feeling it almost impossible to shake off the impression that kept *continually* getting such a firm hold on me that I should never get well. The doctors told me years ago that I should never again be a "well man;" but since then I have had some most glorious experiences in the way of health, energy, vigor, and even rejoicing, because of my strength of muscle. Well, there is still a little more of our text: "Who crowneth thee with lovingkindness and tender mercies." For many days it would seem as if I was not making any gain at all. Then there would be mornings when I felt a good deal better, when I could sing with feeble voice, "Praise God, from whom all blessings flow." By the way, when we were out in the desert, although we were all professing

Christians it did not seem convenient or practicable to have any sort of family worship; and as a substitute I used to sing every morning, and a good many times through the day, the doxology.

Now, the purpose of this little talk to-day is to tell how God answered my petition for health and wisdom, and how to teach others along in this line of getting well and keeping well. While I prayed I made the matter a study. I have sometimes wondered that God gives us so little specific direction in regard to what medicines we should take or what physicians we should employ, or whether we should use medicines at all or employ physicians at all. I can only say that, for myself, I have been forced to decide that he has perhaps wisely left these things, at least to a considerable degree, for us to decide as best we can. The great Father does not propose to do our work for us, nor even to do our *thinking* for us. He will not hear a farmer's prayers, and grant him great crops, unless the farmer uses both brain and muscle to accomplish the desired end.

The disease that had got hold of me was gripping for my lungs. The doctor said a little reckless exposure on my part might send me beyond the *reach* of doctors or medicine. I soon discovered that I should have to keep warm—a good deal of the time *too* warm to be comfortable. Unless I did, that unfeeling giant, which we may as well call Grip as any thing, made me feel his clutches. While doing this, some fresh air and a little outdoor exercise (not too much), I found to be of much benefit. With a weak stomach and impaired digestion I had to be very careful of my diet. Appetite did not seem to be any guide, for I did not really feel like eating any thing. After I got able to be out I noticed the chills came back once or twice a day, and kept giving me a setback. I remember of wondering what the cause could be, and I prayed earnestly in regard to the matter. One day after thus praying, the matter seemed to be made very plain to me—almost as if some kind friend had explained it. It was this: I was getting hold of business a little, and a good deal needed my attention. I would oftentimes be busy until dinner-time or supper-time. I sat down to my meals, and remembered, when I sat down, that I was *very much* exhausted; then an hour later I would have a chill. The suggestion that came to me was this: That I must go home an hour or an hour and a half before meal-time, and take a good long rest. Since the return of my sickness I had been troubled some with insomnia. I could not go to sleep just before meal-time as I did last summer. Then this suggestion, or this kind friend who was advising, said, "If you do not succeed in going to sleep, lie perfectly still for an hour or more before you think of taking food or nourishment." I felt happy in a moment; in fact, I felt sure I understood the cause of those chills, and that I should not have them any more, and I did not. A good many times it was hard to stop work at half-past three, especially when I did not feel faint or tired; but when I woke up just as supper was ready, I felt like a different person.

Perhaps you may say that Dr. Salisbury told me the same thing twenty five years ago. So he did, substantially; but I had forgotten it or had neglected it. And here is a great truth: God often answers our prayers by reminding us of things we knew already, but which we had forgotten or neglected. With the lean-meat diet, I was troubled with constipation more than I ever had been before. The grip seemed to have crippled my digestive or other organs, and the hot-water treatment did not seem to

do a bit of good. The doctor suggested a mild physic; but I told him physic would not work with me as it did with some people. When I told him how it distressed me he said I was right. By the way, I do not believe God intended we should take physic;\* and yet I knew by sad experience that it would not do to neglect a matter of this kind day after day for almost or quite a week. I made this thing a subject of prayer, always adding, "Not for myself, but that I may safely advise others who have like troubles." The answer to this came also immediately. While talking with my mother and sister, I happened to mention the matter. My sister went at once to a bookcase and pulled down some sort of medical book. An old physician said that for eighteen years he had prescribed and used *ground wheat*, with scarcely a failure. I had that same feeling that her suggestion was in answer to my prayer. It was something I knew already; in fact, it has been several times printed in these pages. My sister happened to have some in the house. I took it right home, commenced using it at every meal instead of bread and butter, and in three or four days the trouble was gone. While Mrs. Root was preparing it her eye chanced to alight on something in one of the health journals. It covers the ground so thoroughly that I give it to our readers. We extract as follows from *What to Eat*, published at Minneapolis, Minn.:

At this particular period, when the times are so hard, any thing which will aid us to economize is grasped very eagerly.

The first step is to go to the miller and buy a bushel of his best wheat, and direct that it be re-cleaned before delivery. At the present price this ought not to cost over 75c for the wheat, and 10c or so for the cleaning. The next article to purchase may be a small-sized grinder, but it is not entirely necessary. After using the ordinary coffee-mill, I found a machine better suited to the purpose. It is a reduced size of the large spice-mills which one sees in every well-regulated grocer's shop. I presume there are others as good, but mine cost \$3.00, and was made by the Enterprise Mfg. Co., of Philadelphia. Every kitchen is supplied with the ordinary double-bottomed tin boiler. You are now ready for business. Time, and three hours of it, for cooking, is one of the essences of this dish. Another important feature to be observed is that the wheat should not be broken until you are ready to start cooking the same. Since three hours are necessary, a part of the time during the preparation of the evening meal will have to be used, and the rest in the morning; but, above all means cook it at least three hours, and you have a dish fit for every American sovereign.

I came near omitting one point, which every one will want to know, and that is, that each grain of wheat should not be broken into more than four equal parts (two make it splendid) before cooking.

About this time I happened to notice Dr. Miller's little tract, "Food Value of Honey." I read it, and here seemed to be another suggestion. I found that, while fruit and vegetables did not seem to agree with me at all, the wheat with, say, a teaspoonful of thick nicely

\* I have tried a great many kinds of physic in years past, especially the little pills that have been recommended as being so "mild," and that work along in harmony with nature's course. But my conviction is that they are in one sense *poisons*, all of them. Of course, one may accustom himself to take poison daily, in moderate quantities; but the result, as your family physician will tell you, is that the poison must be gradually increased in quantity to produce the desired result. I have been told there is an epitaph on a certain tombstone, somewhere, that reads,

"I was sick, but would be better; took physic, and died."

This epitaph was intended, I presume, as a warning to future generations.

ripened honey, would be digested without a bit of trouble. Once more:

Several friends have written me at different times that, if I could not use milk as an article of food, I would find by trial that a small quantity of cream would be digested easily. I spoke to our milkman, and he said he would bring me five cents' worth of cream every morning, if I wanted it. Some of you may think that half a pint of cream every day is rather extravagant. Look here, my friend: It costs a dollar or more to have a doctor call. With this same dollar you can get twenty rations of cream; and for my part I should very much prefer to take the cream rather than the doctor's medicines (no disrespect to the doctor; for if he is a good one he is as anxious that you should keep well as you are). If you buy cream instead of medicine, you help the farmer instead of the druggist, and I think he needs help the most, *just now*, at least.

I get a great many bulletins from the different experiment stations. There are so many of them that it is impossible for me to read them all through; but I am rejoiced to note that they almost always have a summary, and I very much enjoy reading it. Now, suppose we have a summary to the little talk on health that I have been giving you to-day:

1. God does not always tell us which doctor to employ, nor what medicine to take.

2. He does, however, teach us in many ways to be careful of sudden exposures, and to keep these bodies of ours well protected during severe weather.

3. He also enjoins us to use both pure air and pure water, and take as much outdoor exercise as possible.

4. He tells us in different ways to be careful about overdoing; to rest our bodies; to take proper rest before partaking of our accustomed daily food.

5. While both God and nature (which is perhaps another name for God) do not seem to recommend physic, he has provided in great abundance food that will, at least to a great extent, render physic unnecessary.

6. While God has not seen fit to tell us *exactly* what kind of food we should use to nourish our bodies, he has, in his holy word, specially mentioned both milk and honey as things to be sought for and considered wholesome. Perhaps wheat has not been mentioned so specifically as milk and honey; but I think every careful reader of the Bible may gather that God's purpose and intention was that he should use both the flesh of domestic animals and the different grains that are recognized the world over as the obvious food, at least to a great extent, for mankind.

The modern way of grinding and preparing grains for food, I think, must be to a great extent a mistake. The method of grinding that has been outlined in this article is almost exactly, in the results attained, like the ancient methods of grinding grain.\* All through the Territory of Arizona I found scattered almost everywhere stones hollowed out, somewhat trough-shaped, in which they ground or bruised the grain they used for food. The smaller stones, used to push back and forth inside the larger ones, are also found everywhere. Many of these are worn down to a thin edge at each of the ends. When we get back to outdoor life and broken or crushed whole grain, instead of fine white flour, we may expect to enjoy such health as God's children did in olden time.

\* The ground grain is then cooked by slow heat a long time; and the cakes called "tortillas" are a staple article of food even now among many Indian tribes.

## Humbugs and Swindles.

Just now there is a great number of humbug advertisements going the rounds, and they seem to find a place in the columns of many otherwise respectable journals. I allude to the kind that are always signed "A Farmer's Daughter," "A Reader," "A Brother Farmer," etc. This kind of advertisements somewhere in the reading-matter refer to certain firms. The writer tells how much money he made in a very short space of time by selling the wares of certain houses. How to make a windmill is just now having quite a run. You are to send a dollar, or some smaller amount, to somebody for instruction.\* Now, this whole thing comes right in line with the business of selling secrets or recipes or instruction. Let me repeat: All that is valuable in agriculture or mechanics is very soon published in book form; and any thing new pertaining to rural affairs is almost always to be found in our agricultural periodicals. Suppose, for instance, you send some stamps, 30 or 40 cents, for directions for making a home-made windmill. You get in return instructions on a piece of paper, generally one page of reading-matter; or even if it were three or four pages, they do not cost the man who sends them more than a cent a sheet. For the amount of money you send, you ought to have a considerable-sized book on the subject. Another thing, these home made windmills are generally practicable only where the wind comes from a certain direction almost every day; and the mill will not run unless the wind is very nearly in that certain direction. The Nebraska Experiment Station is now preparing a bulletin on home made windmills. Just as soon as it is ready for distribution our readers will be notified. This bulletin will be worth ever so much more than any of these plans which you get by sending a dollar or a less amount, in stamps.

## Special Notices in the Line of Gardening, etc.

By A. I. Root.

### GREGORY ON SQUASHES.

In my talk on raising Hubbard squashes, on page 134, I failed to suggest that everybody who proposes to raise squashes ought surely to have Gregory's squash-book. It will pay you to have the book, even if you raise only a few hills in your garden; and the exhortations laid down by that veteran gardener will apply to raising almost any sort of crop by high-pressure gardening; and, besides, it is such interesting reading that any one who will pick it up will be almost sure to read it through from beginning to end. I like to read it through once in two or three years to remind me of things I knew already, but had neglected to keep in mind. We now offer the book at the reduced price of 20 cents. Postage 5 cts. extra, if wanted by mail. See revised book-list.

### TURKEYS, AND HOW TO GROW THEM.

[The above is the title of a beautiful new book just out from the O. Judd Co. In fact its date is as late

\* We have just received instructions for making a home-made windmill, for which we sent 36 cents in stamps. The instructions are on a single sheet of paper, printed on one side, and they are really an advertisement for a set of castings for making a windmill. The castings cost \$4.00. The mill, when it is made, does not turn to face the wind at all. You have to wait till the wind blows in the right direction to have the mill pump water. Still further, and of much greater importance, there is no device of any sort to stop the mill or to turn it out of the wind during a gale—nothing, in fact, to prevent the thing from being blown to pieces at the very first moderate blow.

as 1897. In the frontispiece we have a picture of the American wild turkey, and the book is fully illustrated all through. It has 160 pages, 12mo, and is handsomely bound in cloth. The cuts are, the greater part of them, photographs from nature. The book seems to cover the whole subject, not only of raising turkeys on the farm, but turkey-raising as a business. Price, postpaid, \$1.00. It can be ordered from this office, if more convenient. This reminds me that Salt Lake Valley is one of the greatest places for turkey-raising, perhaps, in the world. They will thrive and grow fat on alfalfa, and you can get a "turkey dinner" in Phoenix, better served, and cheaper, than perhaps in any other city in the United States.

### ALL ABOUT PARSNIPS.

To-day they are quoted in the Cleveland market at \$1.75 to \$2.00 a barrel, and scarce at that. Now, friends, on suitable soil you can raise them for 15 or 20 cts. a bushel, and make money at it. You do not have to guard them from frost as you do potatoes, squashes, onions, and almost every thing else. You just grow your crop and let them stand right in the ground, and dig them whenever there is the best demand for them. The season for selling is from November till May; and any time during the winter when there happens to be a thaw they may be dug and sent off to market. They are a very easy crop to raise. You want to get the seed in very early, so as to have them get a good start before most of the weeds germinate at all. You need not be afraid of frost; and after you get the plants two or three inches high they will take care of themselves. You need a deep, rich, bottom land to grow them—not too much muck, or the parsnips will be spongy and of poor quality. The soil should be sandy enough so the roots can make good shape without having so many prongy ones. In case there should be a surplus (which seldom happens), parsnips at almost always worth more than they cost, to feed to stock. Cattle, horses, pigs, and almost all domestic animals, will eat them greedily. Just now we are getting 3 cts. a lb. for them; and our man who drives the wagon says, "we do not need to advertise parsnips—just say you have got them, and they will sell fast enough." Now, if you want to go into the parsnip business we can give you a lit; for we have just purchased a two-bushel bagful of the very best seed, and we are making the lowest prices on it that we ever heard of: Oz., 5c.; 1 lb., 25c.; 5 lbs., \$1.00; 10 lbs., \$1.50.

### WANTED—BLISS RED TRIUMPH POTATOES.

While almost every other kind of potato is offered at very low prices indeed, no one seems to have any of the Triumphs, and yet they were the standard table potato for many weeks last summer, and Triumphs were quoted in almost every northern city. They were shipped in from the South, and were the standard early table potato. Now, if nobody has saved any of the seed so that it can be sold at a reasonable price, it is a mistake somewhere. Of course the *White Bliss* is just as good, and, in fact, a little better looking; but it is of recent date, and, of course, high priced. Is it possible that our potato-growers were so crazy after new sorts that they neglected to plant this well-known staple and standard variety? I have noticed for several seasons, that when new potatoes first make their appearance, Triumphs are quoted everywhere at the highest price of any variety. In fact, they are so well known that in market reports they do not say "potatoes" at all—just Triumphs, so much a barrel. Now, may be somebody has a big lot of these saved up. If so, and such party can offer them at the prices that other standard early potatoes are selling—say \$1.50 a barrel—here ought to be a good demand for them right off. In fact, in many places they are ready to be planted.

### THE AMERICAN COFFEE-BERRY.

There is just one thing more we want; and that is the American coffee-berry, at a reasonable price. It has been long enough before the American people so somebody ought to have a stock. I should like the job of raising them at \$1.00 a bushel—that is, if I could get the seed to plant at a reasonable figure. I think they have all the advantage of the ordinary soya bean; and, besides this, they are quite a little better for coffee. The beans ripen so early that it is an easy matter to grow them here at the North, and get them matured before frost. We are offering the seed in 5-cent packages; but our stock is so limited that we shall soon be sold out.

# A Dollar Saved

is better than one earned. Read my 37th annual catalog, and don't send out West for goods you can buy cheaper here at home.

I have added 2400 feet of floor-space to my store-house and shall keep in stock Root's polished one-piece sections. Dovetailed hives, new Weed foundation, etc., in addition to my old line.

□ Best breeds of bees and queens at bottom prices. Don't buy until you see what you can do with me.

**W. W. CARY, Colrain, Mass.**

## Cleveland Bicycles.

Every piece and part of the Cleveland Bicycle is made in our own factories by the best of skilled workmen, under most rigid inspection. The result is a Bicycle embodying, in a marked degree, features of safety, speed, and durability.

THERE'S HONEST VALUE IN IT.

We want the patronage of intelligent and discriminating buyers. 1897 catalog mailed free for the asking.

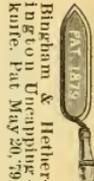

H. A. LOZIER & CO.,  
 Cleveland, Ohio.

Send 4 cents postage for our booklet, "Shakespeare and the Bicycle." Two illustrations in colors by F. Oppen, of "Puck."

**PRICES OF Bingham Perfect Bee-smokers and Honey-knives.**

Smoke Engine (largest smoker made) 4 in. stove.	Dozen, \$13.00; each, by mail, \$15.00
Doctor .....	3 3/4 " " " 9.00; " " 1.10
Conqueror .....	3 " " " 8.50; " " 1.00
Large .....	2 1/2 " " " 5.00; " " .90
Plain .....	2 " " " 4.75; " " .70
Little Wonder (wt. 10 oz.) .....	2 " " " 4.50; " " .60
Honey-knife .....	" " " 6.00 " " .80

The four larger sizes have extra wide shields and double-coiled steel-wire handles. These shields and handles are an amazing comfort—always cool and clean. No more sooty nor burnt fingers. The plain and Little Wonder

have narrow shields and wire handles. All Bingham smokers have all the new improvements, viz.: Direct draft, movable bent cap, wire handles, inverted bellows, and are absolutely perfect. With a Bingham Smoker that will hold a quart of sound maple wood the bee-keeper's trials are over for a long time.

Who ever heard of a Bingham Smoker that was too large, or did not give perfect satisfaction? The world's most scientific and largest comb-honey producer uses Bingham Smokers and Knives. The same is true of the world's largest producer of extracted honey. Before buying a smoker or knife hunt up its record and pedigree.

T. F. BINGHAM, Farwell, Michigan.

D. O. BAILLIFF, Banning, Cal.

**Bargains in Second-hand Bicycles.**

We have on hand two ladies' Defiance bicycles, made by the Monarch Cycle Co., of Chicago, and listed at \$75.00. These are last year's models, and were used by the women of Rootville last season. The two machines are in first class running order; and as they were ridden but little they are practically as good as new. They have Garford spring saddles, reversible handle-bars, 1 1/4-inch tubing, Morgan & Wright quick-repair tires. Weight, 25 lbs. each. Catalogs and particulars will be furnished on application. We will re-enamel them, and sell them for \$35.00 each, or the two for \$67.50. Beeswax or honey at market prices will be accepted in payment. Reason for selling—we are going to have a tandem instead for '97.

A \$100 Rambler Racer bicycle for \$35.00 cash, or \$40.00 in trade for wax or honey at market quotations. The wheel weighs only 20 lbs.; has a new set of Rambler clincher tires, and is almost as good as new. It was ridden by A. I. Root during part of '96, and is just the bicycle for a boy or light-weight man. Further particulars given by applying to

THE A. I. ROOT CO., Medina O.

In responding to these advertisements mention this paper.

## SYRACUSE SUSPENSORY SUPPORTS

and protects the scrotum, and should be worn in every case where there is any drooping of the scrotum. It is especially recommended to wheelmen, equestrians, base-ball, foot-ball, and lawn-tennis players, athletes, men doing heavy work, much walking or standing, etc. Ask your physician's advice about wearing a Suspensory—perhaps it will relieve your backache. Our \$1.00 grade is very popular, and your dealer, or we, will sell you one and refund money if not perfectly satisfactory. For sale by all druggists and dealers in athletic goods. Send for price list. A. J. WELLS MFG. CO., 250 Tallman Street, Syracuse, N. Y.

In writing to advertisers please mention this paper.

## LUNG DISEASES.

30 years' experience. If your case is sufficiently serious to require expert medical treatment, address Dr. Peiro, 100 State St., Chicago.

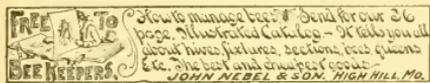

In responding to this advertisement mention GLEANINGS.

Honey Column.

CITY MARKETS.

KANSAS CITY.—Honey.—No. 1 white, 12@13; fancy amber, 11@12; No. 1 amber, 10@11; fancy dark, 9@10; No. 1 dark, 8@9; white extracted, 5@5½; amber, 4½@5; dark, 4@4½; beeswax, 25.

March 3. C. C. CLEMONS & CO.,  
 423 Walnut, Kansas City, Mo

NEW YORK.—Honey.—Fancy white, 11; No. 1 white, 10; fancy amber, 9; No. 1 amber, 8; fancy dark, 6½@7; No. 1 dark, 6; white extracted, 5@5½; amber, 4½@5; dark, 3½@4; beeswax, 27@28. Comb honey has sold fairly well of late, and we succeeded in moving off quite a bit of our stock and think we will be able to close out all of it before April 1. Extracted is moving slow, except buckwheat, which is in good demand. Beeswax quiet at 27-28c per lb. for good average quality.

March 9. HILDRETH BROS. & SEGELKEN,  
 28 & 30 W. Broadway, New York.

MINNEAPOLIS.—Honey.—Fancy white, 12@13; No. 1 white, 10@12; fancy amber, 9@10; No. 1 amber, 8@9; fancy dark, 7@8; No. 1 dark, 6@7; white extracted, 6@7; Utah white, 5@5½; amber, 5@6; dark, 4@5; beeswax, 22@25. Market quiet and without change.

March 3. S. H. HALL & CO.,  
 Minneapolis, Minn.

MILWAUKEE.—Honey.—Fancy white, 12@14; No. 1 white, 11@12; fancy amber, 10@11; fancy dark, 8@10; white extracted, 6@7; amber, 5@5½; dark, 4@5; beeswax, 25@27. The receipts of honey continue fairly good. The supply is fair, and quality very good. The best quality sells best. Because the trade is somewhat slow some receivers seem to think the way to sell is to slaughter prices. Yet the market is fairly sustained and we think all will work off at fair rates before the new crop comes again.

March 9. A. V. BISHOP & CO.,  
 Milwaukee, Wis.

COLUMBUS.—Honey.—Fancy white, 12@12½; No. 1 white, 11; fancy amber, 9.

Feb. 23. THE COLUMBUS COM. & STORAGE CO.,  
 409-413 N. High St., Columbus, O.

CINCINNATI.—Honey.—No. 1 white, 12@13; No. 1 amber, 10@12; white extracted, 5@6; amber, 4@5; dark, 3½@4; beeswax, 22@25. Demand is slow for extracted and comb honey, with a fair supply. Dark comb honey seems to be unsalable. There is fair demand for beeswax, with a fair supply.

March 9. CHAS. F. MUTH & SON,  
 Cincinnati, O.

BOSTON.—Honey.—Fancy white, 13; No. 1, 11@12; fancy amber, 10; white extracted, 7@8; amber, 6; dark, 5; beeswax, 25. The demand is light for honey, with a good supply.

March 9. E. E. BLAKE & CO.,  
 57 Chatham St., Boston, Mass.

ALBANY.—Honey.—Fancy white, 12@13; No. 1 white, 11@12; fancy dark, 7@8; No. 1 dark, 6@7; white extracted, 5@6; dark, 3½@4. There has been quite a good demand for comb honey lately, and stock very much reduced, especially clover. Extracted still moves slowly but should improve soon.

Feb. 26. CHAS. McCULLOCH & CO.,  
 Albany, N. Y.

SAN FRANCISCO.—Honey.—Fancy white, 9@10; No. 1 white, 8@9; fancy amber, 6½@7½; No. 1 amber, 6@7; fancy dark, 5@6; No. 1 dark, 4@5; white extracted, 5@5½; amber, 4@4½; dark, 2½@3½; beeswax, 2@25. Honey and beeswax both quiet. Stocks are light.

Feb. 29. HENRY SCHACHT,  
 San Francisco, Cal.

PHILADELPHIA.—Honey.—No. 1 white, 8; fancy amber, 7; No. 1 amber, 6@6½; fancy dark, 6; No. 1 dark, 5@6; white extracted, 5@6; amber, 5; dark, 4; beeswax, 26. Our honey market is very low with some call, but a big supply. We will not buy or sell on commission any more this season. White-clover extracted always in demand, which we are buying constantly. If you have any, send sample.

March 11. WM. A. SELSER,  
 No. 10 Vine St., Philadelphia, Pa.

DETROIT.—Honey.—Fancy white, 11@12; No. 1 white, 10@11; fancy amber, 9@10; No. 1 amber, 8@9; fancy dark, 7@8; white extracted, 5@6; amber, 4@5; beeswax, 24@25. There is more comb honey in commission houses than I think can be closed out before new crop, and prices rule lower.

March 12. M. H. HUNT,  
 Bell Branch, Mich.

CHICAGO.—Honey.—Fancy white, 11@12; No. 1 10; fancy amber, 9; No. 1 amber, 7; fancy dark, 7@8; No. 1 dark, 6@7; white extracted, 5@7; amber, 5@6; dark, 4@5; beeswax, 25@27. For all bee products, with exception of beeswax, there is a slow market, with ample stocks.

**STRAY STRAWS**  
FROM DR. C. C. MILLER.

TEN CENTS EACH is the price at which W. Z. Hutchinson thinks he'd like the job of rearing virgin queens, using a lamp-nursery.—*American Bee Journal*.

A HUNDREDWEIGHT OF HONEY contains 32.25 lbs. of carbon, 53.75 lbs. of water in combination, 13 lbs of water of solution, and about 1 lb. of salts and other matters.

THIN SHEET ZINC is recommended by H. W. Brice in *B. B. J.* as the best covering for hive-roofs. How does it compare in price with tin in this country, Mr. Editor?

"ARE BEES DOMESTIC ANIMALS?" is a question having some discussion in Europe. How is it here? Some nice legal points may at some time happen to hinge upon the answer.

IS A COLONY of bees an organism? is a question over which German bee-keepers are having a high old time. Gerstung and his supporters say it is, while Dzierzon and others scout the idea.

DZIERZON says in *Noerdlinger Bienenzzeitung* that starving bees throw out brood after sucking out its juices only after the brood has died from want of heat, but that bees never destroy living brood.

JOHN G. COREY spent \$14 for a pump and windmill, and \$4 for a watering-trough for his bees, and thinks he'll save it in bees that would be lost going long distances for water.—*American Bee Journal*.

PH. REIDENBACH has discovered that, besides formic acid, vinous acid (*Weinsquire*) is also present in combs. He thinks it helps prevent mold from dampness, and also helps in changing cane to grape sugar.

A NICE SONG that, to the linden, p. 165. Now what do you think? The author of it read a fine paper on ornamental trees, before a horticultural society, enumerating 13 varieties, and never said "linden" once! O Eugene! Eugene!

GRAVENHORST says that, while in most winters bees have enough chance for cleansing flights, no matter what direction they face, yet once in a while there will be a winter when bees not facing south will suffer from too long confinement. Facing south is always safe.

BEES WILL BUILD combs in wired frames just as readily as if no wire were present; and my experience is that they'll not deviate a hair's breadth to make the septum come where the wire is. If the wire happens to be where they want the septum, all right; but if not, all wrong.

A. F. BROWN has at seven different times fed 200 colonies to get a full working force of field-bees ready for the opening of a given honey-flow, and says, "From this experience I find seven to eight weeks to be nearer right than five or six weeks, as usually given."—*American Bee Journal*.

SIXTY POUNDS of extracted honey per colony, J. McArthur thinks a good average from sweet clover, if it is abundant. R. Stolley thinks five colonies will store more from an acre of sweet clover than would twelve, and estimates 400 to 500 pounds surplus to the acre, if not overstocked.—*American Bee Journal*.

EDITOR BOEHM, of *Deutsche Imker aus Boehmen*, has a colony of bees hanging in the open air that has continued from 1894, having a cloth hung around it in winter. It has twelve combs, the middle one 24 inches deep and 16 inches wide. Last July it cast a swarm of 11 pounds, and an after-swarm of 1½ pounds.

"CAN YOU GET extracted honey from old brood combs of as fine flavor as that in first-class sections?" is asked in *American Bee Journal*. Nine say yes, seven say no. The same question would hardly have had so many negative answers five years ago. [In five years more the answers would all have been negative.—ED.]

GERMAN BEE-KEEPERS don't know much about extremes of temperature if they all have the weather reported in *Centralblatt*. In 1896 the hottest day showed 78° F., against 100°

here; and the coldest day was 12° above zero against 20° below here. The range in Germany for the year was 66°, about what we sometimes have here in two days' time.

FREE ADVERTISING in *American Bee Journal* is given to John A. McCutcheon & Co., Chicago, Williamson Produce Co., New York, and Unger & Co., Buffalo, classing them with Horrie and Wheadon. Editor York sensibly remarks, "Far better to donate your honey to some orphanage and be done with it, than to give it to dealers of no reputation, or that are not well known."

SIX DIFFERENT COLONIES, according to a report in *Revue des Sciences*, show six different lengths of tongue, 7.1, 7.5, 8.1, 8.4, 8.8, and 9.2 respectively—the last nearly a third longer than the first. Now, if there's so much variation why can't a strain of long-tongued bees be developed? Will my highly esteemed friend, the sage of Lapeer, please answer?

"AVOID MELTING wax over too many times; every time makes it darker-colored. Make the cakes medium-sized, and don't pour into the molds until cooled so it will just run nicely. Wet the dish, and you will not have to grease it. If above directions are followed, your cakes will not crack.—M. H. Hunt, in *American Bee Journal*. [M. H. Hunt, according to our experience, is decidedly right.—Ed.]

HOW DOES IT HAPPEN a bee can eat honey for months without becoming overloaded? In winter it eats perhaps three times its own weight without a fly. Well, 99 per cent of honey is oxygen, hydrogen, and carbon; and when that's consumed it turns into vapor of water and carbonic acid gas, neither of which remains in the intestines. In that light the only wonder is that they become bloated as often as they do.

By R. C. Aikin.

OUR WAGON; HOW AIKIN AVOIDS THE USE OF BEE ESCAPES.

In building this wagon, three things were kept in mind; viz., comfort, capacity, and service. For use on our trip we needed room, and at the same time protection. I will describe the wagon first.

The running-gears are the same that I have been using for my honey express to and from out apiaries, etc. It is a regular platform spring, and will carry 1000 to 1200 pounds. I

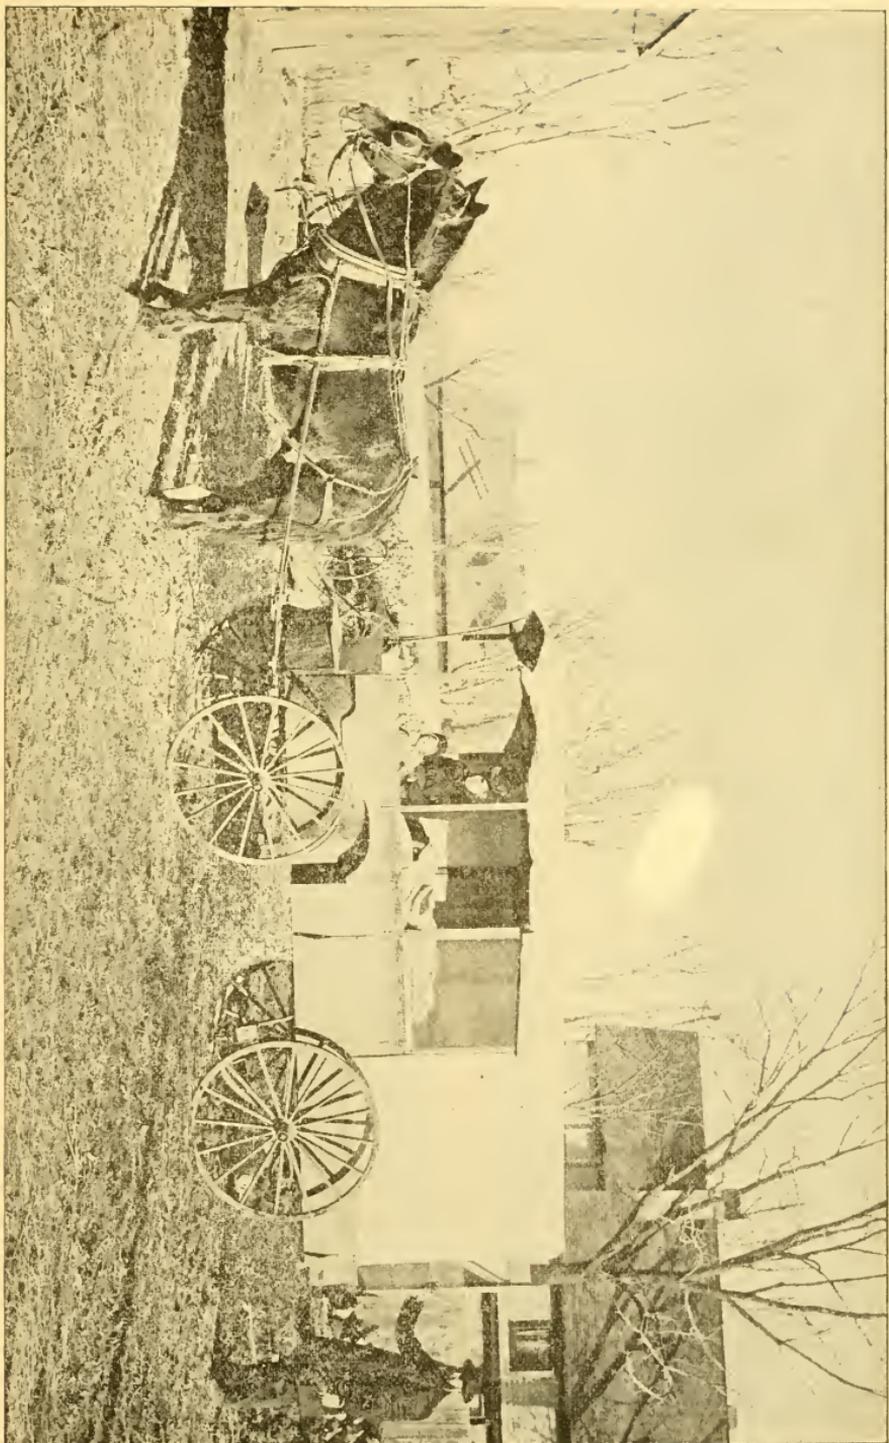

usually carried about 1000 on it in moving hives, honey, or bees.

The box now on it is my own invention, gotten up for the trip, and to use as a honey-wagon afterward. It is 13 feet long from front bow to back, and 4 feet wide, outside measure. From the floor to the highest point under the bows is 5 feet 5 inches—bows what are known as square top. The part of the box forward of the hind wheels is about 27 inches deep, and between hind wheels 13½ inches. The sides are ¾-inch poplar, and the bows are cut square off and set right on top of the sides, and iron plates laid on both inside and out of the lower end of the bows, extending down straddle of the sides, and screwed to the sides. The manner of fastening bows appears very plain in the photo, but may not be so clear in the half-tone. There are 6 bows. The one just in front of the hind wheels goes clear down past the end of the side-board that is scalloped over the front wheel (this side-board goes back only as far as the picture shows it), and is stirruted to it, so there is no possible careening back and forth of this bow; and the others, being fastened to it by the slats above, all are rigid.

It is all covered first with 11-oz. duck; then, over the top, oil-cloth. The part of the canvas that is not rolled up on the near side is fastened permanently, covering two spaces between bows. The next space—just front of the hind wheel—has a wire-screen sash to exclude flies and other insects. The space just forward of the screen, and the next one too, where the wife and baby appear, each has rolling curtains as well as the screened space. This makes 3 curtains on the side, so that the wagon can be thrown open back to the hind wheels. The far side is identical in arrangement, though in the picture but one curtain is up.

There is also a curtain across the front to close that opening, though it does not appear, being rolled up under the "nose." Half of the back end is boarded up solid to the roof while the other half has in it a screen-door with a curtain on the outside of it. The writer stands with his hand on the door-latch, the door being partly open.

Now look at the front end again, and you will see a sort of circular porch or step across above the doubletrees. Under the top of that step, and in the center, running parallel with the wagon-tongue, is a short partition. The floor of the wagon comes out almost as far as the top of the porch or step; and that little partition resting on the floor boards, and reaching plump up against the top, makes the step solid. Now, on the near front corner, just below the scalloped sideboard, look close and you will see ends of two hinges. Right there on the corner of the porch, and extending around in front to that partition under the porch, is a feed-box or trough. On the other side is one just like it,

H. C. AIKIN'S BEE-WAGON AND PRAIRIE SCHOONER.

hinged on the other corner. These boxes open or swing outward and back against the front wheels, and are the horses' feed-boxes when in camp, and places for a wrench, grease-box, halter, or any thing we wish to carry there when traveling.

You will wish to know why those side-boards are scalloped so. The box is 4 feet wide—just as wide as I thought I dared make it, so that mud and trash would not roll up and clog on the wheels. Being so wide it was necessary to have a "cut-under," somewhat like an express or delivery wagon in the city, else I could not have turned in a 20-acre field. I did not want a raised bottom up under the seat, as we often see in family carriages, preferring to have a smooth bottom from end to end; so I cut under only *part way* across, making the floor between the front wheels in an oblong circular form. The box directly between the fore wheels is just as wide as any part; but back and forward of the axle it is rounded in to allow the wagon to turn in a reasonable space. The circular part of the side is made of  $\frac{1}{16}$  inch sheet iron, back of the wheel being bent at a right angle, and reaching out to the side-board. That scalloped board laps back over the lower side-board, and is plated to it, and also has the sheet iron fastened to it right between the wheels, thus securing against any *sag* in the box which would otherwise occur.

That door in the back is hinged in the center of the end, hence, when open, it lies against the closed half. Just inside the closed half, and built against the back from floor to roof, is a cupboard with shelves and drawers. This makes it so that one may reach it from either outside or inside. Just forward of the cupboard, and almost to the hind axle, is an open space, to be used as needed. From the hind axle to the cut-under back of the front wheels, is a bed-spring and mattress. The bed is up about 16 inches from the floor, on a sort of hinged frame of slats, so arranged that the whole thing can be turned up against one wall and strapped there. The bed, being up so high, gives a lot of room under for boxes or luggage. The bed comes plump forward against the back of the seat. The seat is laid across the bench formed on either side by the cut-under, and the seat-back is reversible like car-seats, and at night the back is reversed or thrown forward, forming a little bed for the baby, just at our heads.

The empty wagon weighs 800 lbs. Our load, including ourselves, was 1000 to 1200 pounds. The wagon rides so easily that my wife says she would rather ride in it than in any buggy or carriage she was ever in.

I have given quite a long description of the construction of the wagon, and its arrangement for travelling; and now I want to speak of its use as an

#### APIARIAN WAGON.

For two or three years I have had some ideas in regard to getting off honey and getting the bees out rapidly. GLEANINGS readers who have also been reading the *Review* and *Progressive* will remember that I have written somewhat of the bee-escape. I was not then and am not yet satisfied with the work of the escape, they being too slow. I know that the man who has only a few colonies for pleasure, home honey, or even for profit, but in a small way, may find the escape a very handy appliance; but the man who makes the bee-business a specialty and his dependence, especially if he is producing extracted honey, can not afford to wait for the action of the escape as now used. Extracting-supers must be *off and extracted before cold*.

The plan I have had in mind for out-apiaries is to have a wagon that can be closed bee-tight, wire-screen door or window, or even a cone outlet so arranged that bees would find it easily. Drive the wagon into or near the apiary; and as fast as honey can be removed from hives, put it into the wagon, and allow the bees to escape while I continue my work removing honey or otherwise. I thought that this would beat the escape, and prove a very good thing. The wagon would be a fine place to keep every bit of honey from the bees where no house was at the apiary.

Let me tell why I thought this plan better than the escape. I have found by repeated experience, that, if a super be removed and stood on end near the hive—say a foot or more from it—the bees would rapidly leave it, except a few of the *very* young. This I have done—not once only, but at least 75 or 100 times. The bees would often leave a super in 15 or 20 minutes, and, in the majority of cases, in less than two hours. The same thing occurs if the super be placed in a room before a window so that the bees pass out through an escape at the top of the window. This I know by an experience of several years, and in the production of many tons of honey. From beginning to end I can remove and extract honey much more rapidly by carrying into a room to let the bees out than by an escape.

My experience with the wagon has been very limited; but here is what I did with the wagon here illustrated and described. Last August, just before we started on our trip, I had a few full extracting-extras and a whole lot of partly filled ones to remove at two out-apiaries, and bring home two and three miles. This was after the flow was over, and about the worst kind of time for robbing. I drove the wagon into the apiary close on one side. Myself and an assistant began removing the extras. I would take the cover off, at the same time applying the smoke, managing the smoke so as to start the bees down, and closely following them

until they were nearly all down, when the assistant would pick up the extra from the hive and give a long swinging motion, and rub or brush off on the grass the bees collected on the bottom-bars, then immediately carry the chamber to the wagon and shove it in at the back door. Thus he would proceed until he could not reach to set any more in, when he climbed inside and set them forward in shape to go home. Each time he went with an extra, and the door was opened, a cloud of bees was brought out on the screen, and they at once struck for home. In this manner we would have the wagon loaded almost before the robbers knew what was up; and by the time we got every thing to rights, and ready to go home, we had, by occasionally opening the door, almost freed the load of bees. Just as soon as the team was hitched, the door was set open, and kept so till we were half a mile or a mile from the yard, when we closed it again. It was fully as much of a success as I expected.

□ In constructing this wagon I put in all bolts and irons in such a way that the inside surfaces of the box are smooth, so that bee-hives, supers, etc., can be shoved in and slid along without catching. □ The running-gears are too light for the size of the top and box; and if I am prospered so that I can do so, I shall get running-gears and springs that will carry 2500 or 3000 pounds; then with ordinary hives I can load 40 or 50 hives of bees to move. □ I am so well pleased with the method of removing surplus by carrying into the house to let the bees out of it, that at present I do not wish to use an escape.

[I am well aware, friend A., that you have had a large experience in the matter of taking off honey; but there are others who have had fully as much experience, who use bee-escapes, and insist that they can not get along without them. For instance, J. F. McIntyre and M. H. Mendleson consider them great labor-savers, and would hardly know how to get along without them.\* The value of the bee-escape is especially great during robbing seasons. Very often, comb honey has to be removed at such times; and it would never do to let a super stand twenty minutes or two hours near the front of the hive.

Very possibly locality has every thing to do with the matter; and no doubt you can by your plan, in your locality, remove your honey more economically than with a bee-escape. But last summer I tried setting supers out in front of the hives on which no bee-escapes had been placed. After waiting two hours I got tired, and so I smudged and poked them out, any way to get them out. On other hives, where escapes had been placed the day before, the taking-off of the honey was a real pleasure. There was no shaking of the supers, breaking the back, no smudging, but simply taking them off and putting them on the wagon.

I believe Mr. Aikin shows a practical wagon for bee-keepers. Many of the wagons, as usually constructed for carrying honey and remov-

ing bees, are ill adapted to the purpose. We have a platform spring wagon, with a platform extending over the wheels on each side of the box, and about 14 inches inside of the edge of the box. The bottom of the box is filled with as many hives as we can crowd in, and then the platform is loaded. We have carried as many as thirty colonies at a load, but it makes the wheels creak a little. Last summer we brought home about 1000 lbs. of honey from our out-yard in this same wagon. If we were going to build again we would have the springs and the general running-gear made so as to carry not less than 2000 lbs.—Ed.]

### APIS DORSATA.

REASONS PRO AND CON FOR IMPORTING THEM.

Dr. C. C. Miller:—I should like to ask you for a little information in regard to *Apis dorsata*. I am a reader of GLEANINGS, and notice articles by a few on this subject. On page 6, Straws, by yourself, I notice a clipping from the *American Bee Journal*. Now, while I do not believe there is a bee in existence that can gather honey from red clover (except the bumble-bee), please tell me what objection the 14 referred to on said page can have to the government importing them here, and giving them a trial; for if there is such a bee as described, let us by all means have it, and the sooner the better. We know that there is more genuine honey in red clover than in all other honey-plants combined; and if we can get a bee that can and will gather it, we shall have a boom in the honey business in every department. If there is any good objection to the importation of *Apis dorsata* I should like to know what it is; and it would give me much pleasure and satisfaction to have a reply through GLEANINGS. I have kept bees for thirty years, but as a business only five. DAVID N. RITCHEY.

Blacklick, O., Jan. 14.

It seems entirely natural and reasonable for any one to take the view that you do upon first being told that there is a bee so much larger than the one that we now have that it can work upon red clover. Tons of honey go to waste every year that might be gathered from red clover. It would cost very little for government to introduce a bee that can gather it; if a success, it would be a great gain; if a failure, no harm can come of it except the small item of expense incurred by government, and that will be divided among the entire nation, making the expense to each bee-keeper only a small fraction of a cent. So it must be that there are some objections or else the 14 to whom you refer would hardly oppose the movement.

I will try to answer your question as to the reasons given by the repliers in the *American Bee Journal*, so far as they gave them. The question asked was, "From what you have heard and read concerning *Apis dorsata*, do you consider it advisable for the government to

\* Mendleson is the man who moves 150 colonies at a single load. See his article, page 817, last year's volume.

import them?" The first answer, given by Wm. McEvoy, is, "No," without any reason added. E. France says, "Yes, try them." Mrs. J. N. Heater says, "I think not." J. M. Hambaugh says, "I am in favor of making the effort." J. A. Green says, "I consider it an experiment of doubtful value." R. L. Taylor says, "No, not in the interest of bee-keepers financially."

I do not know just why Mr. Taylor thinks as he does; but if the project should prove a failure it would certainly not benefit bee-keepers financially. On the other hand, if it should be a success above the highest expectation of any one, and if it should be found that *Apis dorsata* should in this country prove as tractable in every way as *Apis mellifica*, doubling the annual yield of honey, does it necessarily follow that bee-keepers would make money by it? One of the greatest difficulties of the present that confronts bee-keepers is that of finding a market; and if the output should be doubled, and the price cut in two, it would only increase his labor without increasing his pay. But if honey could be made plentier and cheaper, that would certainly seem to be for the good of the people in general, and the financial interests of bee-keepers should not stand before the general good.

W. G. Larrabee says, "Yes, if they would not turn out like the English sparrow." He may have in mind the possibility that *Apis dorsata* would divide the harvest with our present bees, without any additional benefit.

Chas. Dadant & Son hardly have any such fears, for they say, "We do not believe *Apis dorsata* would stand our climate." C. H. Dibern says, "No. I think they would be of no value to the bee-keepers of America." P. H. Elwood says, "Probably not. There are other things the government might do that would help us more."

Prof. A. J. Cook is emphatic in his indorsement, saying, "I certainly do. I think that is just the kind of work for the government to carry forward;" and G. M. Doolittle thinks it can do no harm to try, for he replies, "There is lots of money spent more foolishly by the government than in importing *Apis dorsata*."

Dr. J. P. H. Brown says, "My opinion is that they would not be a desirable acquisition to the bee-keepers of the United States." Jas. A. Stone says, "I have not made up my mind. In doing so, I always think of English sparrows, and I am very slow to say yes." Eugene Secor says, "If the government wishes to experiment with *Apis dorsata*, I have no objections; but as a bee-keeper I shall not ask it to do so at present." Emerson T. Abbott says, "No. Government was not organized to import bees, or any other kind of live stock. The sooner people learn this the better it will be for them and the government too." Rev. M. Mahin says,

"I do not. It is my opinion that they would not be of any advantage to the bee-keepers of America. If they were capable of domestication the people of India would have domesticated them long ago."

Mrs. Harrison seems inclined to poke fun at the scheme. She says, "I do; and put them in the everglades of Florida. They are 160 miles long and 60 miles broad. The water is from one to six feet deep, dotted with little islands. The Seminole Indian and *Apis dorsata* would go well together, for he likes honey when it is to be had for the taking; also fruit; but in his wild state he has never been known to plant a tree or keep bees in a hive."

G. W. Demaree says, "I should be glad if the Agricultural Department of the government would take the matter in hand and import the big honey-bee of India, *Apis dorsata*. But, really, I fear that the undertaking might fail because the officials would most certainly intrust the management of the new bees to some favorite dudes, who would make a windy failure of them." J. E. Pond says, "No! Most decidedly not. . . . I am of the opinion now that the discussion that is being made is more to subserve the purpose of some one who knows that cranks and an easily gulled public always exist, and are 'playing a tune to suit their desire for dancing.'"

Less has been done by our government for bee-keepers than has been done by other governments—Canada, England, and some of the European powers. It has done less for them than it has for perhaps every other interest pertaining to agriculture, so it would be nothing very immodest for bee-keepers to ask such aid as they might desire. But if they ask for something that proves of no benefit to the country, will it not lessen their chances for getting aid in other directions? Better first ask aid in the way of experiment stations or something of that kind—something as to whose success there can be little doubt, and not a thing that many regard as a will-o'-the-wisp.

You may ask what reason there is for considering success so problematical. Some have said they think *Apis dorsata* might be successfully domesticated here, and that possibly it might be crossed with *Apis mellifica*. Those of opposite views point to the stubborn fact that it never has been domesticated in its own country. Those who appear to know something about the matter say it can not be domesticated; that it will never stay in a hive, but at stated times will desert its habitation just as surely as a migratory bird. Surely it seems reasonable that it is hardly worth while to bring it here until success has been attained in confining it to a hive in its own country.

You press the point that there is a great quantity of honey to be had from red clover. But it will do no good to get another bee to

work on red clover unless we can get the honey; for the bumble-bee works on it, but that doesn't specially benefit the bee-keeper. Very likely you may say, "Well, even if we don't find it any better than the bumble-bee, it can't do any harm to import it, even if it does no good. The bumble-bee is the only bee that works on red clover, and it will be no loss to let the two big bees divide." Softly. You are quite mistaken in thinking no bee but the bumble bee now works on red clover. Many have had bees that gathered more or less honey from red clover; and very likely if you watch from year to year you may see some of your own bees at it. It is not at all impossible that we may breed *Apis mellifica* with a tongue so long as to reach to the bottom of the red-clover tubes. There is a decided variance in the length of bees' tongues. In France they have been making an effort to breed larger bees, longer tongues coming with larger bees. In our own country Dr. Murdock has bred bees so large that the worker-cells are almost as large as ordinary drone-cells. He says they work well on red clover.

Now, suppose *Apis dorsata* is brought into this country, behaves as it does in its native land, and multiplies so as to gather nearly all the red clover honey. Don't you see that it will not only be of no use, but that it will be a positive damage to those who have a red clover strain of bees? No wonder English sparrows came up in the minds of two of the gentlemen making replies. No, let us work to get *Apis mellifica* regularly instead of exceptionally to work on red clover, and not run the risk of getting *Apis dorsata* here until we know for certain that we can make it work for the benefit of its owner, and not to his detriment.

C. C. MILLER.

There are plenty of things we need at the hands of the general government much more than the importation of *Apis dorsata*. If any one wants these bees I don't not that they can be obtained from missionaries far more cheaply than by sending some man desirous of a fat government job after them.—ED.]

#### QUALITY OF COMB AND EXTRACTED HONEY COMPARED.

IS THERE ANY DIFFERENCE? IF SO, WHY?

By F. A. Snell.

There is quite a difference in the views of bee keepers upon this subject. Why this difference? It seems to me it must result largely in the difference in management practiced by the apiarists. Many claim that the quality of honey stored in new combs or in sections is of better quality than that stored in old combs, such as are used mostly for extracted honey, while others as earnestly claim there is no difference. My experience has been that as good honey can be secured in the extracted form,

stored in old combs, as in any other form; and during some seasons, if anything it is better.

In 1895 and '96 our extracted honey was of better body—that is, thicker and richer in flavor than our comb honey. Other years there has been no perceptible difference. Our comb honey was well sealed, but the honey was rather thin or unripe the past two seasons from clover and basswood. The combs on the extracting-hives were only partially capped. The honey was left on the hives some time, which gave time for the moisture to be evaporated; thus it was better ripened than our comb honey, which must be removed soon after it is capped, to present the best appearance and bring the highest price in market.

My extracting combs are kept dry and sweet when not in use. No pollen is stored in them, nor brood, as I use a queen-excluder which keeps the queen from these supers. In good seasons I tier up. I first put on one super of combs; and when these are nearly filled, and a little capping done, I raise this super up and put a set of empty combs under it, next to the brood chamber, which gives the bees more room. Storing is begun in the new super, and the upper one is filled. Much of the honey being thus uncapped, it is ripened more completely even than when capped soon after being stored. In a week or a little more the first supers are emptied of well-ripened honey, as most of the newly gathered honey has been stored in the lower story.

If the honey-flow at this time continues good, the emptied stories are put under the one put on a week previously, and the work goes on, and we shall have the (then) upper stories of well-ripened honey to take off a few days or a week later. All strong colonies are managed as above described. Those not so strong are run only two-story; but the honey is left on the hives until of good quality. When taken off, all our honey is stored in the honey-room, which is a hot place, and air-dry.

In fine weather the screen-covered windows are left open by day. Our extracted honey is stored in open cans and barrels. With this method we secure good honey if the flowers yield. Of course, in past No. 1 seasons the honey seems almost ripened when stored, and need not be then left so long on the hives. Unfortunately we have had none of these since 1888. In 1895 and '96 our fall honey was of better body than that gathered during summer.

Millidgeville, Ill.

[Whatever may be true of your extracted, the average of extracted is not equal to the average of the comb honey. There is one point that you have not mentioned; namely, that in the production of comb honey the bees begin to store in shallow cells. As the honey is stored the cells are increased in depth. Meanwhile, the honey in these shallow cells is ripening as it is stored, and more perfectly than if stored in the deep cells (full depth) of extracting—

combs. The average consumer says comb honey tastes better than extracted; and if there is any difference it is due to the storage in the shallow cells to start with.—ED.]

### LOP-SIDED SECTIONS.

TWO OR ONE STARTER; A REPLY TO DR. MILLER.

By G. C. Greiner.

In his strawy comments (I mean the comments in his Straws) I am pleased to notice that for once Dr. Miller agrees with the rest of us, at least in so far that he does not lay the attending trouble to oblong sections. But in explaining the cause by "weak colonies and poor harvests," I believe the doctor is joking. Yes, Dr. M., this is not the Eldorado of bee-keeping; we have occasionally weak colonies and poor harvests, too, but no more lop-sided sections when these conditions are prevailing than we have when matters are more favorable. If colonies are too weak to work properly, what is the object of letting them spoil what little they do do? Why not unite, make one strong one of two or three weak ones, and produce a desirable, perfect article?

The bottom-starter theory may work with Dr. M. to his entire satisfaction, but I hardly think the extra work and expense of putting in two starters instead of one would be a paying investment with the majority of bee-keepers. Years ago I experimented in that line to some extent, but I could never see any great advantage over the single-top starter.

In writing the sentence which Dr. Miller quotes in Straws, I have probably been a little too hasty, covering too much ground without a sufficient amount of backing. I have never examined unfinished sections for the sole purpose of ascertaining the relative amount of drawn cells and honey contained in the two sides. I simply wrote from the impression which any one receives from the glancing look with which sections are handled when sorting and putting them up for shipping.

Since Dr. Miller mentioned the lop-sidedness of his sections, I have given a lot of unfinished sections a thorough examination, and found that my assertion made in the quoted sentence in Straws is practically correct. This lot of sections, six or seven 24-lb. shipping-crates, is all I have left in the same shape it was when taken from the hives, and is such honey as we sort out for family use, home market, to give away, etc. These sections range anywhere from not quite finished to one-half to two-thirds capped, and are just the right kind to have this lop-sided work, if bees are inclined to do business in that way. To be sure, if we count the cells and measure the depth of honey they contain, we can notice a slight variation on all of them; but the variation is almost always at the very tip bottom end, so that the center of grav-

itation would not vary from the center of the section more than a mere trifle, even if the combs were not attached to the sides and could swing back and forth, as when hung at the top by hinges.

Naples, N. Y.

### ANOTHER BEE-KEEPERS' UNION.

THE DUTY OF THE HOUR.

By J. F. McIntyre.

As I read the paragraph at the bottom of p. 129 in GLEANINGS for Feb. 15, I thought of the article and footnote under this heading on p. 610, GLEANINGS for 1892. Please read them, Mr. Editor, and tell us if you do not think that much valuable time has been wasted, and a great deal of foolishness indulged in, by beekeepers since these lines were written. Paul said, "This one thing I do," and he made a success of doing that one thing. Newman says, "This one thing I do—defend persecuted beekeepers," and he makes a success of it. He could not see his way clear to fight the glucosmixers, and make a success of it, and I do not blame him for refusing to undertake the task. I have a few dollars which I should like to spend in prosecuting those men who are labeling glucose "Pure Honey," and spoiling my market for the genuine article, and I know a few other bee-keepers who have a dollar to spend in this direction, and I propose that we put our dollars together and authorize some one who is interested in saving the bee-business from destruction to spend them. I can see no harm in forming a union for any purpose that may be desirable to unite for, and not waste time and energy in trying to get a union organized for another purpose, to change its purpose and spend its money for something else. If I put up a dollar to fight glucose I feel like saying, "If you can't fight glucose with it, give it back to me." I do not want it diverted from its purpose, and used to fight Wheadon & Co., or carry on a lawsuit between two neighbors. The more things a union can use its money for, the less confidence people will have in it, because the manager may spend the money for something that we have no interest in whatever.

Fillmore, Cal.

[I still honestly feel that one union could and should do the work of the two; but now that amalgamation is defeated we may be forced for the present to have two unions—one for defense and the other for fighting dishonest commission houses and the adulteration evil. Of course, there are many things I might say; but now that the "war is over" I deem it both unwise and unnecessary to say any thing further relating to Mr. Newman's policies. The duty of the hour is to beat our swords into plowshares, and begin work in harmony and brotherly love. As you will notice in another column, the new Union is laying its

plans to go to work; and it will be glad to receive the names and the dollars of any who are interested in the matter of fighting the glucose evil; and while you and I may have different opinions on these matters, we surely can and will work in harmony in both Unions.—Ed.]

### CAN EXTRACTED-HONEY PRODUCERS AFFORD TO BE HONEST?

A SIMPLE WAY TO DETECT GLUCOSE IN HONEY.

*By Geo. L. Vinal.*

*Mr. Editor:*—To illustrate why I chose this subject, I will give a little of my experience in the last two years—not but that I hope all honey-producers are honest.

Last fall I sold some honey to a friend of mine, one who ought to have known that I would not sell any thing but straight goods (it was extracted honey). About New-Years' day I saw the parties, and they asked me what made me mix so much sugar with the honey. It was almost impossible for me to convince them that it was not mixed.

Another case in a town about four miles from here: I have sold honey to a grocer for four years, put up in pint jars, labeled, etc. This fall he bought at one time a gross, put up in the jars, and at the same time he bought 325 lbs. of extracted in bulk and 100 lbs. of comb. (I wish to state I had done quite a business in peddling in the town, and could generally sell the second time.) As he was the principal grocer, I did not go there to peddle, as he gave me to understand that he was going to retail the honey in the town. About two weeks ago I went there and called at the store. □ The clerk did not know me. I saw, arranged among my labeled jars, jelly-tumblers and some pint jars, unlabeled, filled with honey and a piece of comb about an inch square in each. □ I asked the clerk (a lad about eighteen or nineteen years old) where Mr. W— was. He replied he had gone to dinner. □ I talked about the honey, sampled some of it in the tumblers, and finally got the lad to say it was mixed with syrup of some kind. When the proprietor came in I asked him about it. At first he denied it; but when I told him I knew it was mixed he said, "Yes, it is about two-thirds corn syrup, or glucose." He says it sells better. It does not sugar, and people like it better, for they think when it granulates it is mixed; and as long as it stays liquid they think it is pure; and if they want it that way why not let them have it? He said, "I can make double the money that I can to sell pure honey."

I asked him why he did not melt all of it.

His reply was, "There are some people here who have had your honey, and know that pure honey will granulate, and will have no other. That I keep to sell to my best customers, and

to use in my own family. I went to a confectioner's, with whom I am acquainted, who is making and selling honey caramels. I asked him how much glucose he mixed with the honey he sold. He said about one-third. I asked him why he mixed it. His reply was, 'It does not granulate; and, besides, it makes it cheaper, and the people like it as well as or better than the pure honey when it is sugared.'

I thought I would see the opinion of the different experts. I got some glucose of him. He said it was the very best quality made. I put one-half good clover honey with it, and sent out five samples to different experts, so called, sending a stamped and directed envelope to each, requesting them to give their opinion as to what kind of honey it was.

No. 1 answered that, in his opinion, by the taste, it was a fine sample of white-clover honey.

No. 2 thought it was a good sample of bass-wood and clover.

No. 3 thought it might be a mixture of some kind of syrup and honey, probably glucose.

No. 4 said he thought it was clover and other flowers mixed.

No. 5, whom I expected the least from, said it was a mixture of glucose and honey, according to Root's test.

Now, how is the general public to discriminate the pure from the adulterated? Not one-half of the people read the directions on the bottles about liquefying the honey, or about its granulating. I do not believe, Mr. Editor, all that can be written in the bee-journals does any good. Some able writers should write in some of the daily papers, the agricultural papers, in the magazines, and in that way educate the masses, and thereby kill out the frauds.

Charlton City, Mass.

[It would seem that the policy of making public this article was somewhat questionable; and yet I believe the readers to whom it goes are just the very ones who should know the facts, and thus be able to cope with the evil in a proper and intelligent manner.

In the first place, it is evident that not all the glucose-mixing is done by the large syrup-handlers and honey (?) -houses of the cities. Some confectioners know that, by adding glucose, they can very materially increase their profits—for a while at least; but after a little they will find that their customers tire of such insipid honey.

There are two kinds of glucose on the market—the ordinary, the metallic taste of which in honey can be very readily detected by an expert. This glucose has a brassy and (to me) a somewhat nauseating flavor; and from tests which I made a few years ago I could detect even 10 per cent of it in honey just by the mere taste. Such goods will not sell long, for they are too vile for the stomach of a hog. But there is another kind of corn syrup, the very finest, from which this brassy metallic taste has been eliminated. It is this article, mixed in honey, to which Mr. Vinal doubtless refers, and which can not be readily detected by the taste.

A tolerably sure means, and a very simple one indeed, for determining the presence of such glucose, is by what is known as the alcoholic test, incorrectly called the Root test above, but which in reality is a test that we obtained from the *Bienenwatter* (Bee-master), of Germany, and which reads as follows:

Take a tablespoonful of the honey to be tested, and pour it into a small bottle. Then add three spoonfuls of alcohol, and shake the whole together thoroughly. In about a quarter of an hour there will form in the bottle a cloudy, whitish sediment, and from this one may be sure that the honey is adulterated with glucose.

The directions above say *shake*; but a better way is to stir it vigorously for some little time, and then allow it to stand. In about fifteen minutes it will look as if a very small quantity of milk had been mixed with a little quantity of water; that is, the mixture will have a bluish, milky cast. While this alcoholic test does not show the percentage of adulteration, it is very reliable in showing the presence of the cheaper article. In this State, at least, it is just as much a violation of the law to put in a little glucose as a large amount, without labeling it. If there is any corn syrup present at all, you may be sure that the mixer would not stop short of 50 per cent. If he is dishonest enough to adulterate, he will make a job of it.

Now, I would suggest that bee-keepers buy samples in their local groceries everywhere, of jelly-tumblers containing the liquid stuff with a piece of comb in it. Go to your drugstore and get ten cent's worth of alcohol. Take the stuff home and try the test. If it shows glucose, send the label, detached from the tumbler, to us. If it is not labeled, send the name and address of the grocer handling it.

Although there may be such, I know of no bee keeper or reliable honey-house that puts up pure honey in this shape. The piece of comb is simply a cloak to cover up dishonesty. The very fact that we have had repeated calls for pieces of dry comb, from concerns whose stationery shows they make a specialty of syrups, shows very plainly what the object is.

The heading at the top of Mr. V.'s article is rather startling. I suppose friend V. put it there for the very purpose of catching the eye; but all our readers, or nearly all of them, including friend V., will conclude that the bee-keeper can not afford to do otherwise than to sell the pure product of the hive. You will notice I put in a clause above, "nearly all." Perhaps I should be justified in striking it out entirely. However, as there may be one or two black sheep in our midst, and probably are, I leave it in.—ED.]

## CHIPS FROM WOODCHOPPER.

### THE USE OF BURR-COMBS.

Bees usually gnaw the cappings of sections for several reasons. 1. Because they are scared when they are disturbed, and proceed to get a load of honey from the first that comes to the touch. At such times they will cut the cappings when there is plenty of unsealed honey within half an inch of them. They seem dazed, or get reckless. I have seen a black swarm bite nearly all the cappings in the brood-chamber during an examination, and it is expensive business too; for they never fix it up again, and a few such scraps will use up a winter supply,

and unless there is a late flow they will have to be fed, as I have found to my sorrow, sometimes, in requeening, when no honey was coming in.

Another reason is, that they never leave the sections and go back without as big a load as they can manage to fly with; and unless this is supplied in some other way they are obliged to bite cappings to get it; and right here is where the much-abused burr-comb does a good turn if they are filled with honey, which, being broken in removal, furnishes their load, and starts them home much sooner than they would otherwise go. I may add that, at any other time, the burr-comb is a nuisance, although bees will enter the sections sooner and work better with them between the top-bars and the super.

I know one man who had Langstroth hives with light-top-bar frames which sagged half an inch or more, and that space was filled with combs which he never removed, but set the surplus-receptacles directly on them with a thin board bottom between to keep the combs from being attached to the sections. He never gave the bees any other attention than to put them on at the beginning of the harvest, and remove when full; and I have never seen a whole apiary in my life that filled up as uniformly and in as good shape as that one did year after year; but bees could not be handled in that way if you ever wanted to know any thing about their downstairs condition, for they were as immovable as a box hive, but much better for honey production. (Now, that chip must be twice as large as the whole block.) If that big cave had been located here for the last two years there would be neither tons of honey in it nor even pounds; and how do those fellows know about the amount of honey, any way, as they say it can't be seen nor got at?

### BEE-PARALYSIS.

I've had quite a good many cases of it, Dr. Miller, that did amount to something. I always cure it, but it spoils the swarm for that season, if it gets much of a start before it is attended to.

### CURE.

Kill the queen and allow them to raise another from the egg. Don't put in a cell or another queen, but let the brood get all out of the way before another queen gets to laying. I never had a hive affected again if treated that way.

### BEE-SPACE AROUND END OF FRAMES.

Why, Dr. Miller, you are over thirty years behindhand if you have just begun to use it. It was the biggest nuisance in the whole business—that is, to have the ends go down tight, and it always made me out of patience to get hold of such a hive. It's far worse than burr-combs. I used nails for end-spacers once, but discarded them years ago, and don't want any kind now; and if I wanted fixed frames I would

use nails in preference to any thing else; but I've no use for fixed frames either.

WHY DO PLANTS YIELD HONEY SOMETIMES AND SOMETIMES NOT?

Well, it is a disputed point, some thinking it wants lots of electricity; but the poorest seasons, and the most of them, with me, have been just that kind of weather. Then others say, dry and warm. Well, that is better for a little while, but it's sure to cut the flow off by killing the plants if it is very dry; besides, in my opinion, drouth is very nearly always at the bottom of the whole thing of honey failure. In an experience of 37 years with bees I have never had a good yield of honey in a season that followed a very dry spell the year before; and I never had a failure the next year after a wet summer, no matter what the next year was—hot or cool, wet or dry. Do you see the point? Some do, and some don't. Well, it is this: If plants can have sufficient moisture all through one season they will prepare for a good yield the next year, and will give it unless something kills them next year or they get winter-killed. I have never seen it fail.

As to the theory of the condition of the atmosphere at the time of blooming, I don't believe it makes much difference. Indeed, the best yields of honey I ever got were in some of the very worst atmospheric conditions possible. I once had one week of great yield when it was so cold and dry that it killed the clover in a week, and killed all the field bees to get the honey too. The sunshine was very bright every day; but a cold northeast wind blew right off Lake Erie. The clover belt was about a mile from the lake, and about two miles from the apiary (every thing nearer and on higher and dryer land dried up without coming to bloom at all); and the bees were obliged to face that chilling wind to get there, and at the end of one week there were no workers left, all having perished except the younger ones not old enough to work outside. The clover also perished about the same time; but in that week the best hive filled 50 1-lb. sections, and made a winter supply, and the weaker ones got heavy for winter. Trees are not so much affected as plants, as they form their buds and get ready for next year during the month of June, especially basswood, the buds of which are full grown and all wood growth done usually by the middle of the month; and although the latter part of the season may be very dry, it does not make much if any difference with plants like buckwheat that grow and bloom all the same year. I think the same conditions prevail, as I never knew it to yield much honey unless it could have moisture to make a good thrifty growth up to the blooming period; but if stunted, and short of water when it was going up to bloom there was little or no honey, no matter how favorable the weather was during bloom.

I have had four good crops of honey in succession, every season of which had had lots of rain; then that was followed by six years of drouth, and not one of these gave any more than enough to winter the bees; and since I have been here we have had three dry seasons followed by no honey the next year, and two wet ones followed by good yields the next year. This past summer was fairly wet, and I expect honey next year any way, whether wet or dry, unless it should be so dry that clover can not grow at all, as it was two years ago.

---

BEE ESCAPES, ETC.

ANSWER TO MR. F. GREINER'S INQUIRY, PAGE 83.

By S. A. Shuck.

It is one of the peculiar characteristics in the natural instinct of our common bees not to desert their home, by compulsion or otherwise, without taking sufficient food with them to last them two or three days. This is manifest in the amount of honey taken from a hive by a swarm just issuing; also, when bees are drummed from box hives in transferring; or in disturbing them in any way so as to disorganize them from their regular routine of business.

So pronounced is this peculiarity in their nature that any disturbance of a hive that interferes with the labor of its inmates seems to beget within them a fear that they are to be summarily expelled from their home. The peculiar individuality of different colonies of bees makes this matter much more discernible in some colonies than in others, and is much more pronounced in some races than in others. For instance, the common black and Carniolan bees are much more excitable and become disturbed much easier than pure Italians. The former, on becoming disturbed, do not look for open cells from which to obtain a supply of food, but in their excitement they tear open the cells about them, take up a supply of honey with manifest nervousness, and rush from the combs in that pell-mell, hurry-scurry kind of way that is so characteristic of those races, and which make them so distasteful to the practical bee-master.

Now, in answer to Mr. Greiner's question, "Who can tell us why bees act so in one case and not in another?" I wish to say that, when the escapes are used in the height of the honey season, the bees have all the honey in their sacs they can conveniently care for; and when they are disturbed by the insertion of an escape-board, there is no occasion for their taking up more honey; consequently the cappings are not interfered with. But after the cessation of the honey flow, and especially at the close of the season, there are not only fewer open cells that contain honey, but the bees have but little or

no honey in their sacs, so that, when they find themselves cut off from the brood-chamber by the insertion of an escape-board, they may perforate the cappings to obtain a supply of honey to take with them. But, as stated above, there is a great difference in the excitability of different colonies; and while pure Italians will usually pass out quietly without molesting the honey, blacks, Carniolans, and their crosses are liable to mutilate the cappings more or less late in the season. And further: As the last bees to leave supers are the ones that become most excited over their more apparent isolation, it is natural that they should mutilate the cappings on the sections nearest the place of exit.

One of the leading features of rejoicing over the introduction of a good, practical bee-escape was the lessening of the damage to comb honey by the bees perforating the cappings; for in the old way of smoking and brushing off the bees from sections, in many instances the cappings were badly mutilated in spite of the bee-master's efforts to prevent it. With the use of escapes, the bees do not become so alarmed; and if the bee-master is up and doing in good time there is but little excuse for complaint in this direction.

Talent, Oregon.

#### FUEL FOR SMOKERS.

THE CORNEIL SMOKER; SHAVINGS VS. STOVE-WOOD; PRICES IN CALIFORNIA AND NEW YORK; BRITISH MARKETS; FOUL BROOD; HORIZONTAL WIRING OF FRAMES.

By Wm. G. Hewes.

I have been testing your Corniel smoker, and find it the equal of any other smoker in all respects, except in price, and in that it is superior, being less—a valued consideration in these days of low prices for honey and only occasional crops.

I notice you recommend burning hard wood and shavings. Shavings are all right. Nothing I have used suits me so well; but to burn hard wood is better for the manufacturer of smokers than for the bee-keeper, because the great heat from the glowing coals of the wood will burn out the smoker in half the time that shavings, rags, punk, etc., will do. I find that the fire-box and nozzle are the parts which first give out; and I think that, if they were made of heavy galvanized iron, the life of a smoker would be longer.

At first I did not like the hinged nozzle, as I found it very difficult to tip back when the smoker was cold and the creosote hardened; but I find that, by tapping the nozzle lightly with a bit of wood, where it fits over the fire-box, it will readily open.

In the "Year-book of the Dept. of Agriculture" for 1895, Secretary Morton, in his report, has a few words to say in regard to the honey

market in England. He quotes "Thurber & Whyland's white-sage honey," in one-pound jars, as selling at \$2.30 per dozen, or nearly 20 cts. per pound. "California, in original cans (about 56 lbs.), per cwt. of 112 lbs., \$9.60," or a trifle over 8½ cts. per lb. As this honey was purchased from the producers at an average of about 4 cts., it can readily be seen that the speculator made a good thing; but what, in our Western vernacular, "breaks me all up," is when I realize that Thurber & Whyland buy my honey for 4 cents, put it into a quarter-cent jug, and sell it for twenty cents. No wonder they are multi-millionaires if they are in the habit of making 400 per cent profit on every thing.

It seems to me the British market is worth investigation by our Exchange if we ever again have a crop of honey to sell; and that jug process, for multiplying by five the price of our honey, gone through with at home.

Secretary Morton further says: "Our agent in England has had several inquiries as to the honey market this year, especially from Texas, and has supplied inquirers with names of importers in England and with information as to how to approach them, and this he will be pleased to do for all inquirers." I should like to request right here that, if any of these inquiring Texans made a shipment to England, they tell through GLEANINGS what success they met with.

The Secretary speaks of bee-keepers as "honey-makers." I wish to inform him, through the medium of this journal, that it is not the bee-keepers who make honey, but New York and Chicago merchants.

Foul brood seems to have been rather more contagious the past season than usual. Apiaries which had it several years ago, but whose owners thought in 1895 they were rid of it, were found the past spring to be badly infected again. The foul-brood inspector, Mr. Hart, was sent for, and he looked through all the apiaries in this district, marking the diseased hives; but I fear it does not do much good, as he is not authorized to burn the hives, and the owners often try to cure, which, if they are inexperienced or careless, only results in spreading the disease. Healthy districts are often infected by the moving of a diseased apiary into their midst. A desirable law would be one preventing any person from moving bees without first having them inspected and pronounced free from foul brood. A similar law is now in force in this State in regard to fruit-trees.

Some years ago, when you published the Keany method of wiring frames, I fixed about one thousand in that way; but, as I found that, when the foundation was drawn out in strong colonies, it sagged and made a bad kink where the wires crossed, I abandoned it for the hori-

zontal process, which I had used for a number of years previously. There was one idea in Keany's method, however, which was worth retaining, and which I have retained, but which I see by your circulars, you have not, and that is the fastening of the wire to nails bent in the shape of hooks instead of sewing through holes in the end-bar. I find that, when sewed, unless great care is taken when scraping propolis from the frames, the wires will be cut, and the work undone; and where one has not machinery for making the holes it will be found easier to drive and bend the nails than to make holes with a punch. I do this work on an anvil, as driving against something solid enables me to sink the nailheads into the wood. I use nails  $\frac{1}{2}$  inch longer than the thickness of the end-bar. By a tap from the hammer they are bent over, and, after the wires are in place, another tap sinks the projecting points into the wood, and the wires are a fixture.

[We very much prefer shavings in place of stovewood; but some people have an idea that a smoker is not good for much unless it will burn stovewood. Our Corniel will burn hard fuel as well as any.

It is a pretty big margin between the price of your honey in California and the price as it is about to leave New York. Would it not be well for the California Exchange to seek to find its own British markets rather than to pay some one else a pretty big salvage for doing the same business?

After we had tried the Keeney wiring for a season we found the same difficulty you report. We then took up horizontal wiring, and have been using it ever since, and have as pretty a lot of combs as you ever saw.—Ed.]

---

### PETTIT'S SYSTEM OF TAKING COMB HONEY, AGAIN.

HOW TO GET THE BEES TO FILL OUT THE OUTSIDE SECTIONS.

By S. T. Pettit.

I notice that you, on page 52, have mixed up my system of taking comb honey with Mr. Danzenbaker's system, and that you have come to the conclusion that the results will be practically the same. But I think quite differently. Mr. Danzenbaker's reversible bottom-board (I wish you would let me say "floor" instead of bottom-board) gives an entrance of one inch high only, and the same elevation is kept up all the way to the rear end of the hive. My system gives an entrance  $1\frac{3}{8}$  in. high, and the bottom-bars at the rear end are only  $\frac{3}{8}$  to  $\frac{1}{2}$  in. from the floor.

Now, there are obvious reasons why the results will not be the same in the two systems. Let us look at them for a moment. When the bees come in from the fields a few times they learn to realize pretty clearly that, with a  $1\frac{3}{8}$ -inch entrance, they can not reach the frames

near the entrance; a lower entrance would encourage them to keep on trying once in a while. Then, again, when the rear ends of the frames are within about  $\frac{3}{8}$  of an inch of the floor, the bees are induced, or a part of them are, to go right on until they can easily catch on to the bottom-bars; so you see this places a lot of them right away back where most needed, the others going up the sides.

But with Mr. Danzenbaker's equal height from the floor, all the way back, almost all the bees would go up at the sides, or manage to reach the frames some other way; they would not go clear back; and the result would be a greater or less neglect of the rear sections. But in my system, the rear sections are equally well cared for. And, further, I want the rear end of the floor about an inch higher than the front end. That position keeps out the water, and helps the bees to keep their house clean.

Again, the section super should not be far from level from front to rear. Well, now, we see that the wedges fix these requirements just right also. I may be allowed to point out that there is less work in placing the wedges in position, and removing them, than there is in reversing the floor twice.

Well, dear Ernest, I beg to say that footnote is my excuse for these comparisons. I have no axes to grind, and no desire to say an unkind word against any one's hive. I believe that reversible floor is an advantage in giving more roominess and more air, but at the same time I am persuaded that there is a more excellent way. It appears to me just now that so much has been said about the lower arrangements of the hive that there is danger of losing sight of the important feature of giving two bee-spaces at the sides of the supers. S. T. PETTIT.

Belmont, Ont., Can., Jan. 23.

[I did not mean to convey the impression that your system and Danzenbaker's were identically the same, but I am glad for your further statement in the matter, for it will leave the subject, I am sure, in such shape that there can be no further possible misunderstanding. Mr. Pettit is a careful bee-keeper, and our readers will do well to try his plan.—Ed.]

---

### WOLF-HUNTING.

INTERESTING REMINISCENCES OF A BEE-MAN.

By E. France.

After living on the frontier in Iowa, trapping and hunting 6 years, I came to Grant Co., Wis. I found pretty good trapping here, so I went at my old tricks again. Beaver were gone, but there were some otter, coon, mink, rats; some wildcats and wolves were quite common. A few years after I came here the county put a bounty of \$4.00 on the wolf. Then the county raised the bounty to \$8.00 to kill a wolf; then the State put on a bounty of \$10.00 for wolves,

and \$10.00 for wildcats. That year I killed 38 wolves and ten cats. The next year the county dropped the bounty to \$5.00; the State also dropped the bounty to \$5.00, providing the county paid five; if the county paid no bounty, then the State paid nothing; so in my county the bounties amounted to \$10.00 for young or old; so I went to hunting young wolves. I found that a different job from what it was to trap old ones.

There were about 40 days, commencing April 5th, when the litter of young ones would be likely to be found together, and could be captured in a bunch. The average litter was about six. For several years I caught from 22 to 40, average about 30, most of them young. But sometimes the old one would be in a den of rocks with the young ones, and she would be very likely to make it lively for the hunter to get them out. Very few had their young in dens. They would more often be found in a thicket of brush or a hollow log, or in the grass, strawstacks, or almost any place, like a litter of pigs. But I found several litters in rock dens.

I had a hard fight with one in a den once. I found them just at night, about sundown. I stopped up the hole, or entrance, of the den, so the old wolf would not move the pups, as she would be very likely to do if she found that some man had been there. After stopping up the hole I went off to a farmhouse to get some supper. After supper I went back to watch the den until daylight the next morning. Two farmer boys went with me. They said they would stay all night, but they got cold and went home at two o'clock. I stayed. There was a little cave up the hill, about 15 rods away, where I could keep out of the wind. I stayed there most of the time. About once an hour I heard something stepping around, and would hear little stones rolling down the steep side hill. I supposed it was the mother wolf, and I was afraid she would dig the young ones out and carry them off. So I would go to the den, and feel to see that the hole was stopped up yet. At such times I would listen at the den, and could hear the pups whimpering.

When it came daylight I went to work enlarging the hole so I could crawl in. I worked about two hours with a hoe that I was working with. It was dark in there, as I made the hole only large enough for me to crawl in, my body nearly filling the drift that I made. When I got to the end of the den I pulled one of the pups to me with the hoe. I took it out and killed it, then went back for more. I hauled another one to me, took it by the leg, and then hauled another one to me; but in getting it so I could reach it with my hand I hurt it with my hoe, and it cried out. Then in an instant I found out that the mother was at home. She came for me; but the hole was pretty small, and I kept pounding back with

the hoe; but she gained on me until I had the hoe by the ferrule, just at the neck of the hoe, and the wolf biting the blade of the hoe. I felt her hot tongue on my fingers. I kept chopping down on her toes and nose so fast that she gave up the fight and went back to the nest again. Then I crawled out, with the two pups that I was holding with my other hand. Then I walled up the den again, and made ready to get the "old gal" out. I had a set of tools of my own make—the head of a carpenter's brace, with a hoe-socket welded on so that I could fasten a pole to it. I had some spears, hooks, twisters, etc., I could put in one at a time, the same as we use carpenter's bits. I cut a handle for my tools, and put in a long ugly-looking spear. I lighted a candle (I always carried a candle), then opened the den and went in with my spear in one hand and candle in the other. Mrs. Wolf was waiting for me, with her head toward me. I instantly speared her in the throat, killing her the first jab. I drew her out, and then got out the rest of the young ones. A spear is better than a gun for that work, as the gun fills the den with smoke; and, if you don't make a dead shot, you are in danger. With a spear there is no smoke; and if the first jab doesn't kill, you are pretty sure to have the spear anchored in the beast strong enough to hold the animal away.

#### ONE MORE DANGER.

I was hunting one spring along the Mississippi River bluffs for young wolves. I found a place where I was pretty sure there was a litter. About 150 feet up a perpendicular bluff of rocks there was a narrow shelf of rock about two feet wide the most of the way. But there was a part of the way where the shelf was only a foot wide. The rocks above hung over the shelf, so that one could not stand up; in fact, I lay down and crept along the shelf for 50 feet or more. At the further end of the shelf the space widened out and formed a cave under the overhanging rock, big enough for a good-sized bed-room. In there lay seven young wolves—seventy dollars' worth—too young to fight or run away; old one not at home. I killed and scalped the pups, and the next thing was to get back safely. When I looked back over that narrow shelf of rock, and the ragged pile of rocks 150 feet below, I would gladly have given up the seventy dollars' bounty to be safely out of there. But the only way was to go back the way that I came. True, I had gone over the place once, and could I not go back just as easily? In going over the shelf to get there, at the narrowest place there was a rock in the shelf that projected out a little further than the rest of the shelf. After I had got my body past I put my foot against that rock to push myself along. I broke it off and it fell below. That lessened my safety in going back. I took a good rest, took off my coat

and dropped it over the fall, and dropped my hatchet, and started back. I got back by hard work. Then I sat down and rested for an hour before I went down to get my coat and hatchet, and I promised myself that I would not go there again.

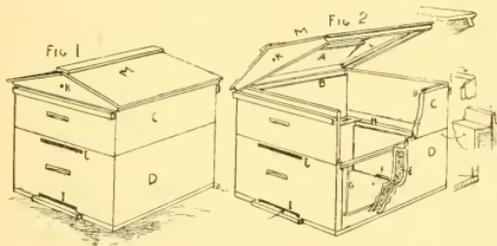

Platteville, Wis.

### YOUNG'S CHAFF HIVE.

By J. M. Young.

If you were to step into our workshop or apiary to-day you would see a lot of hives very much in appearance like the small one I send you by this mail. It will explain itself, and the manner of construction will show to you what we have been using to winter our bees in for a period of fifteen years. At one time we had quite a number of colonies in these hives; and from what experience we have had in using them we have met with excellent success, the per cent of loss being very small, usually, when the bees were in the proper condition for wintering.

The model will show that the lower story is packed with chaff only; and the upper story, being single-walled, can be removed by the operator when handling the brood-frames in the lower part of the hive.

The upper story contains frames also, but they hang at right angles to those below. This removing of the upper story in order to get at the lower part is one special feature in making and using chaff hives nowadays, and is one appreciated by practical apiarists. The constant use of this hive by us ever since its introduction alongside of the new dovetailed, has clearly proven that it is not far behind the single-walled hives in manipulation, from the fact we use it every summer, one as much as the other. The outside dimensions are about 20x22, and 21 inches deep. We use the improved Hoffman frame, size  $9\frac{1}{2} \times 17\frac{1}{2}$ , and any of the single-walled hive furniture is interchangeable with the chaff

hives, or vice versa. It can be made for 10 or 8 frame size, as the apiarist may desire, without changing the dimensions, outside measure, by simply making the inside box of the lower story to suit the number of frames desired.

The 8 frame size has three inches of dead-air space for packing at the sides, while there is only about one-half inch at the ends. It has been our experience that this amount of dead-air space is sufficient to obtain good results; and wider than this is really not necessary. We think this space should by all means be filled with something. We find that dry, loose chaff is more suitable than any thing else that we have tried.

Any size of honey-case or super can be used in this hive, or any width; the new dovetailed-hive super can also be set in or tiered up as may be desired, or, if preferred by the apiarist, a regular 8 frame hive body, with wide frames, may be used in the upper story.

All our chaff hives are furnished with the gable cover, this style suiting us the best. They are about 2 inches deep at the sides, and a sheet of tarred paper is placed under the roof-boards to save leaking, should the lumber be wind-shaken or split. Three-quarter-inch holes are bored in the ends of the gables, giving plenty of ventilation when wintering. Of course, the Higginsville cover may be used, according to the wishes of the bee-keeper; but we prefer a cover that will fit over the outside of the hive, telescope fashion; then there will be no chance for the weather to beat in and wet the chaff cushions or packing.

The bottoms of all our chaff hives are stationary, and nailed on, with tarred paper placed under the boards.

When the time comes to prepare the bees for winter there are always colonies in the single-walled hives that want to be packed in chaff. Well, it is not necessary to have any outside winter-case, as is usually recommended, to set over single-walled hives, but just take an empty chaff hive (we always have plenty left over after swarming), remove therefrom all the frames, and fill up the lower story with chaff or leaves. Next remove the top and bottom frames of the single-walled hive that contains your colony to be fixed for winter, and then set it inside of the upper story of the chaff hive, and pack all around with your packing material. Of course, your single-walled hive must rest on strips to enable the bees to work out at the upper entrance, as shown in the small hive sent as a sample.

Another special feature of this hive is that of having an entrance at both ends, so that two small or weak colonies may be wintered in the same hive with only a division-board between them. Two colonies in one hive will use less

honey, retain the heat, and winter better than if placed in separate hives. Again, in rearing queens these same large chaff-packed hives afford ample protection to the nursing bees in cold, bad, rainy weather. Such bees must have protection in some way to insure the hatching of the young queens. Thus, in case of an emergency, these hives can be used, or will answer to almost any purpose that comes up in the apiary.

In using single-walled hives during the summer they should be made with square joints; but in using chaff hives we want them made with rabbets or laps, so that there will be no possibility of the weather beating in and wetting the chaff cushions or the bees. In summer the square joints in hives, if broken loose, will be fastened up again by the bees, while in winter they will not be.

It looks very reasonable that chaff hives made with square joints are a grand mistake, and will endanger the life of the colony by allowing the wind and rain to drive in. It will be noticed that all our chaff hives are made to prevent this by cutting a rabbet or lap clear around the hive, where the two stories come together, one-half inch deep and seven-sixteenths inch wide, the cover telescoping over the hive one-half inch, thereby leaving no chance for the water to get in.

The hives are all made of good average pine lumber, thoroughly seasoned and dry. The boards are all cut off square, and nailed under the old-fashioned way, depending merely on the strength of the nails in holding the hives together.

The manner of dovetailing the hives together is one grand improvement recently made in the construction of hives, and will be recognized by all practical bee-keepers; but it takes special machinery—something that all wood-workers do not have.

In conclusion, we don't want it understood that this hive will winter bees every winter without some loss; but we believe that (and our experience has proven this) if bees are in proper condition they will winter as well in this hive as in any chaff hive now made; but the special feature of this hive is in summer management, and the advantages it possesses over other hives of its kind.

Plattsburgh, Neb.

alone, or for honey and some crop of fruit or seeds?

*Answer.*—This question covers the ground of much discussion which has come about during the past; and I believe that the conclusion come to by nearly all practical bee-keepers is, that it does not pay to plant good land with any seed or plants for a crop of honey alone. Where waste places may be utilized, or something which will produce much honey be made to take the place of weeds, burdocks, or briars, then the planting for honey may be beneficial, not only to the bee-keeper, but to all others, as something of value to some one takes the place of that which is of value to no one, and that which is often worse than of no value, for the scattering of seeds from these waste places is often a nuisance to those who live where the winter's drifting snows may carry the seeds of noxious weeds far and wide.

If I were to think of planting for honey alone, I can think of nothing better than melilot, or sweet clover; for with us this plant commences to bloom at about the time white clover begins to fall, and continues to bloom from then to frost, to a greater or less extent. Some say that stock can be taught to eat melilot, in which case it becomes a valuable forage-plant, and pays better than almost any other forage-plant, aside from its honey-producing qualities; but, so far as I know, no animal will touch it in this locality.

Alsike clover is one of the best plants for both honey and hay; and for quick returns there is probably nothing better, taking every thing into consideration, than is this clover. But unless precaution is taken it will bloom at the same time white clover does; hence it is of less value than it would be, so far as honey is concerned, could it begin to bloom at about the time white clover failed. But it can be made to bloom at the time wanted by turning stock on it, letting them keep it eaten down short till about two weeks before you wish the bloom to commence, when it will give a good crop of blossoms and hay, though not quite as large a crop as it would if it could have had its own way.

If the questioner is young in years, and has patience to wait, I would advise him to plant basswood. In the list of honey-producing trees and plants it stands first in bountiful yields; and in the fine flavor and beautiful quality of the honey produced, it is second to none, while the day is coming when any thing in the way of basswood lumber will sell at a price that will make it profitable to the one who can furnish any lumber of that name. Fifty years from now this grand tree will have practically ceased to exist in our forests, and be little known save as it is planted by enterprising persons, or exists in some gorges or out-of-the-way places not easy of access. Where there were fifty trees

PLANTING FOR HONEY.

*Question.*—I wish to sow or plant something that will bloom about the time white clover falls. What is likely to pay best for honey

in this section in my boyhood days of thirty-five years ago, there is hardly one now; and the few that are left are of the "second growth," or so crooked and scrubby as to be of little value for lumber.

To prolong the season so as to have honey in August, I would advise sowing buckwheat. The honey it produces is not of so great value as the white honeys, yet it comes at a time when it helps the bees in building up for winter, and brings a price in market that will pay for the labor expended, while the grain will amply pay for the whole raising of the crop, so that all that is secured by the bees and their keeper is clear gain.

#### REPLACING QUEENS.

*Question.*—Is it best to change queens that are three years old? I have some that were just as good layers as ever last fall, in my strongest colonies; but I am told that I should change them in the spring, as they will fail to give good results next season. How long do queens live?

*Answer.*—Best queens live to be four, five, and six years old; but the average life of queens is about three and a half years. The length of a queen's life, other things being equal, depends upon the tax that is put upon her egg-laying powers, and under our modern management queens do not average so long-lived as they did in box-hive days. I do not think that the question of age, however, should be considered in the matter of changing queens, except so far as it may be taken as a sort of rule to judge of when they will be apt to fail. I would not replace a queen so long as she lays up to her full average, especially in the spring, for early spring is a time when any queen that is of any value can supply all the eggs that her colony can care for and bring to perfection. A change at this time results in a loss of bees at just the time when each bee is of the greatest value to push forward the rearing of others for the honey-harvest; hence if queens must be changed I would advise waiting till about 20 days before the honey harvest; for the loss of eggs usually sustained through a change of queens will then be no loss at all, as they would produce bees that would arrive on the stage of action after the honey harvest is past, only to become consumers instead of producers.

As to the changing of queens, I pay very little attention to the matter where the colonies are working for honey instead of queen-rearing, for I find that nineteen colonies out of twenty will supersede their own queens as soon as they need changing; therefore it is a waste of time for me to be worrying about this matter, keeping track of the ages of all queens, etc., when the bees will look after the matter at the proper time. The bees will attend to this changing, and make fewer mistakes than you are likely to make, no matter how careful and

wise you may be. Now, if any think Doolittle wrong in this matter, let them set apart a certain number of colonies to try each way, and a term of years will tell you which will pay you the better.

*J. B., Va.*—The Langdon device did not prove to be a success, and was abandoned as not accomplishing the desired end. As to whether the bees fought when thrown together, I don't believe there was any trouble along this line.

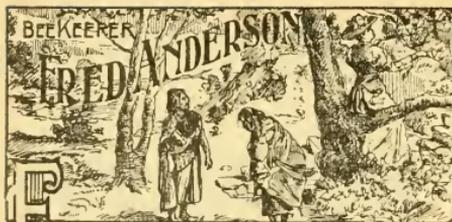

*J. B., Mich.*—A good deal depends upon your climate as to when you should take the bees out. Better a little late than too early. Better wait till about the middle of April or first part of May. The usual rule is when soft maples come into bloom.

*E. A. C., Wis.*—An absconding swarm may go anywhere from a few feet to several miles. Usually they go to the woods, from one-half to a whole mile from the point of starting. For further particulars see "Absconding Bees," in our A B C of Bee Culture.

*A. R. W., N. Y.*—1. As a general rule, bees fill the lower part of the hive or brood-nest full of honey before they go up into the supers. 2. Some bee-keepers have two entrances, especially if the hive is a tall one; but usually one is enough, providing it is large. 3. About 25 lbs. of sealed stores is required for a colony in a 10-frame Langstroth hive.

*J. M. C., Ala.*—The item in regard to glucose seems to be written by some one interested in the glucose industry. Even assuming that it is harmless, it has very little if any sweetening power, and is almost invariably used for fraud—that is, to piece out honey and other sweets. It is never sold under its real name, unadulterated, to consumers. Many of the statements in it are absolutely untrue. A few years ago the writer tasted glucose adulterated in various mixtures of honey; also tasted liberally of the pure glucose itself, and he had quite a sick spell after it.

*G. B., N. Y.*—It is not advisable to feed syrup during mid-winter. Better give them a mixture of powdered sugar and honey kneaded into a stiff dough. The probabilities are, your bees do not require any feeding all. The course you are pursuing tends to stimulate them unnecessarily, and will be more likely to kill them than to save them. If they have stores in combs, better let them alone and keep them as quiet as possible. The only information we can give you on the subject of winter feeding is that contained under "Wintering," in our A B C of Bee Culture.

FRED ANDERSON hurriedly drew on his clothing while stepping from his cabin, and saw, on the terrace below, Alfaretta dressed in white as he had seen her many times at her home. She was attended by two of the older squaws from the rancheria.

"How on earth did she get here?" said Fred, in an undertone.

In order to answer Fred's question, let us return to the Buell home, sixty miles away. After Matt Hogan had so hurriedly left the Buell wharf, as narrated in a previous chapter, Mr. Buell returned to the house, and, in company with Alfaretta, cared for the pony which Matt had left picketed near the hedge. Alfaretta petted and praised the pony in her demonstrative way, insisting meanwhile that it was a jack mermaid, and Jack it was thereafter called.

"How strange," said Prof. Buell to his wife, "that Ralph Hayden should turn up so near to us, and that, too, when we thought him dead! It must be nearly fifteen years ago that news came of his death in South America; but, my dear, I feel it my duty to hunt this man up; and, indeed, if it is our old friend and kinsman we have some things to explain and some things to regret."

"I suppose," said Mrs. Buell, "the regrets are over our change of name. The doctor may think it was done for purposes of deception. The thought of it, and of Alfaretta's condition, quite unnerved me when Matt delivered his message."

"Yes, my dear," said Prof. Buell. "now that you have opened the subject upon which we have been silent for years, I will say that I have many times regretted the change. Bull is a good enough name for any family. My ancestors all lived under it, and were proud of the name; and I have proved weak and recreant to the pride of my sires."

"This is at too late a date," said Mrs. Buell, "to repine over the past; the change is so slight that it does not worry me, and you know I never did like the name Bull."

"Yes," said Prof. Buell, reflectively, "but I remember you kept it to yourself until after we were married."

"Did I? Did I?" said Mrs. Buell. "How did it compare with my beautiful name, Valentine?"

"I know," said the professor, "that compar-

isons are sometimes made odious. I know that Valentine is a pretty name, but you appeared real glad, and so did your family, to have it changed to Bull."

"Oh me! oh me!" said Mrs. Buell, hysterically, "and I must take all the blame, all of it. I, a poor weak woman, must bear it;" and she rested her face upon her hands, and sobbed aloud.

"There—there, my dear," said Prof. Buell, softened by the sight of tears, "I think we had better drop this subject; let it remain buried again as long as it has been in the past. In the morning I will row up to Ghering's and find out from Matt where this Dr. Hayden lives. We may find another man, and all of these circumstances a mere coincidence;" and Prof. Buell stepped out of the house and shouted for Gimp, who was helping about the ranch for a few days. As no reply came to his repeated calls, he asked Alfaretta, who just then came up the walk, as to his whereabouts.

"Oh! Gimp—why, pa, he is out by the river trying to change a sitting hen into a mermaid;" and then she laughed wildly.

"Goodness!" said the professor, as he started for the place indicated.

Just over the bank he saw Gimp, with a dilapidated-looking hen in his hands, ducking her head under the water, then holding her up; and while the poor hen gasped for breath he would shout earnestly, "Now, darn ye, set, will ye? darn ye! I'll learn ye to hogsnoggle the hul nest—darn—"

"Why, Gimp, what are you doing with that hen?" shouted Mr. Buell.

"Darn her, she'll set," said Gimp; "but I'll take it outen her," and the hen's head went into the water again with a "darn ye, set, will ye?"

"Here, Gimp," said Mr. Buell, "bring that hen right up here. Why, you've almost drowned her now."

"Yes, pa," said Alfaretta, "she's almost a mermaid."

"But that's the way mom allers cures a settin' hen," said Gimp. "Mom says yer can't drown a settin' hen. She ort t' had another dose; but I reckon she'd be tentified now to lay eggs, and not set."

"Well, Gimp, let the hen go; we will take your word for it, that she will not sit. Now I want you to mount Jack and trot down to the

postoffice. Those Italian queens I sent for must have arrived in the last mail."

"Wa', I reckon so tu," said Gimp; "this'll be the third trip I've made, and mom says three times and out."

With a few divisions and a few colonies from the trees, Mr. Buell had made a respectable increase of his little apiary, and now the queen phase of bee-keeping was upon his mind; and

upon Gimp's return this evening he was made happy by the safe arrival of three beautiful golden Italian queens.

The queens in their neat little cages, with the worker bees as escort, were examined with deep interest by the entire family, and Mr. Buell carefully studied the instructions for safely introducing the queen to a colony of bees. He was but a novice in bee culture; but the advances in bee-management in the last few years, and the plain instructions that accompany every phase of it, makes the attentive novice equal to any emergency, and the professor proceeded confidently, the next morning, to introduce his queens. One of the colonies was already queenless; and to this colony was due the queen movement on the part of the professor. When one colony greatly needs improvement, there are others that can be benefited. It required but little manipulation to place the cage containing a queen into the queenless colony, and leaving it so that the bees could release the royal occupant.

The next two colonies that needed improvement were black bees; and in the search for the black queens, as frame after frame was removed, Gimp saved Mr. Buell much time in the search, for it was his sharp eyes that found the queen in both instances. His training with Fred Anderson had not been without good results in various directions, and especially in the management of bees.

"Now, Gimp," said Mr. Buell, when the black

queen had been caught, "what shall we do with her?"

"Do jes as Fred did with his old queens—pinch thur heads off."

"These queens look so nice, though black, I do not like to kill them," replied Mr. Buell, musingly. "Here, Gimp, just skip over to the shop and get a couple of those old queen-cages that Fred left here."

"That's fine," said Mr. Buell, upon Gimp's return. "We will now save these queens and take them up to Matt Hogan; he may need them."

"That are so," said Gimp, slowly; "and ef you give Matt the queens, mebby he will give you suthin'. Wish he'd give us his shotgun."

"Why, Gimp Dawson," said Mr. Buell, in evident surprise; and then, said he, impressively, "Gimp, you should not look upon a gift in that selfish way. It is our duty to help our neighbor in every way we can; but when we help that neighbor we should not expect to receive any thing in return. Why, my dear boy, if I expected Matt Hogan to give me any thing in return for the queens it would destroy much of the pleasure I have in making the little gift."

"That must be so, seein' you say it," said Gimp, in a hesitating tone; "but dad allus said real good folks never got rich; they was jest respectable; but dad was a curus man."

"Yes," said Prof. Buell, in a musing way, "just respectable; and in that way many a poor man is rich and many a rich man poor. Oh how mistaken is the world respecting riches! Sordid wealth has its pleasures for a day. The wealth of a day well spent, of helpful deeds, are eternity's jewels.

"How far that little candle throws its beams,  
So shines a good deed in a naughty world.

"Yes" (and as he said it Prof. Buell's hand was laid gently upon Gimp's shoulder), "you should learn from the good book that 'a good name is rather to be chosen than great riches, and loving favor rather than silver and gold.' My dear boy, remember it." The queen introduction had been completed. Gimp was now directed to get the boat in readiness, and soon the professor and Gimp were rowing toward the Ghering ranch.

From Prof. Buell's personal knowledge of an enthusiastic lover of the honey-bee, he expected that, after so many weeks' absence from his pets, Matt Hogan would be examining his bees; and, as he fully anticipated, so he found Matt in his apiary.

"Well, Matt, how do you find them?" said Prof. Buell, as Gimp and himself adjusted their bee-veils and approached the hives.

"Sure, and they are doin' as will as can be expected of thim, seein' the ap'ry has had no father to it for so many days. The corner hive over there was undetermined by the badgers, and it was cocked up sidewise, like auld Tim Brady's

hat. The skunks have been scramblin' in front of some; covers were awry, and the waads choked the front and the raar of the rist of them; and I am sorry, professor, to find three of me hives where they are all poor motherless children. There's no quans, and the dear little baas are as lonesome as—as—I am widout me Biddy Malony."

"Well, Matt, I am pleased to be able to make glad the poor motherless children in two of those hives. I have been introducing Italian queens to some of my colonies, and here are two black queens. I did not like to kill them, and thought possibly you could use them, and surely you can."

Then Prof. Buell handed the cages to Matt, who was much surprised and gratified over the opportune gift; and with much gusto he said, "Prof. Buell, it's meself that'd be after putting yees name wid the saints. Nobody but yeersilf would think of helping a poor fellow loike me; but, professor, it seems yees are always thinking kindly of yees neighbors."

"There, there, Matt; let me help you introduce the queens," said Prof. Buell, by way of an interruption to Matt's grateful expressions. When the work had been accomplished they sat down upon some empty bee-hives, and Prof. Buell said: "Matt, I came up here to ask you about this Dr. Hayden you spoke of yesterday. Where does he live?"

"Sure, I am not knowing where, professor. He said he lived in the mountains; and as to its bein' the Sary Nevada, the Coast Range, or toward ould Shasta, it's a sacret he held fasht to."

"Rather indefinite," said Prof. Buell, "but did Fred go off with this doctor, not knowing where he was going to?"

"I think he did, sur, and its yeersilf that wouldn't question the doctor, for he is that kind, like yeersilf, professor. Its meself that'd not be flatering yees, but I'm thinking there's a family resemblance between yees."

"Possibly," said Prof. Buell; "I knew a doctor Hayden many years ago; in fact, I had a cousin bearing that name, and I would go a long journey to find this doctor. Peradventure he might be the same."

"An' sure it was Frid and mesilf that mentioned yeeer name furnist the doctor, and he said neither aye or nay to it. He ounly said it would sound better if the name was Bull—plain Bull."

The color of the professor's face heightened, and in a nervous way he arose suddenly from the hive upon which he was sitting and said, "Well, Matt, I hope you will have the best of success with your bees. We will not have Fred Anderson to give us instructions, so we must compare notes often, and instruct each other. Hello, Gimp! we must pull for home."

When the two disappeared over the river bluff, Matt Hogan, with hands in his pockets and eyes bent upon the ground, was evidently

struggling with a perplexing problem. Finally, in an undertone which increased in intensity, he said, "To me own thinking, there's somethin' mysterious about this whole business. If I says Adrietta, up go their hands in amazement. If I says Hayden, off goes Mrs. Buell in a swoon; and to-day it's Bull that stirs the professor off his seat, off home, and red in the face. Now, be gorry, I believe I'll shont calf to meesilf, and run to cover in the chapparal."

#### "PATENT PROCESS FOUNDATION."

MR. HUTCHINSON publishes an item that *apparently* gives an unfavorable showing to the new Weed foundation. In his introductory he says: "They have been experimenting with different brands of foundation over at the experiment station in Canada." Then he gives two paragraphs from a report that goes to show that the "patent-process" foundation gave the poorest results of any of the samples tested. The time this report was made (I think it was in 1894) was *before* Mr. Weed conceived the idea of making sheeted wax by his present plan. The article designated as "Patent Process" was not the same as is *now* made, and which has received the universal indorsement, both of experiment stations and private individuals. The experiment in question was, according to the experimenter, conducted late in the season, and the results were not, therefore, satisfactory.

#### FACTS AND FANCIES ABOUT THE NEW DEEP-CELL-WALL FOUNDATION.

MR. LEAHY, of the *Progressive Bee-keeper*, says that the putting of this article upon the market, to "accumulate wealth, and prostitute the teachings of the Bible," is "adulterating that which is spoken of as *sweeter than honey*;" that "they say it contains no more wax than the thinnest foundation." If Mr. Leahy will show us *where* we have claimed it was as light I shall be greatly obliged; but I have said we *hoped* we might make it—that we had not yet. Again, he says: "I have before me a sample of this luscious foundation, the side walls of which are  $\frac{1}{4}$  inch from the base. I have also a piece of thin and extra thin foundation." Then he goes on to show how by weight the foundation weighs less than half the "artificial comb," as he calls it, and then adds, "It is also claimed that this will be no more expensive than comb foundation. This looks fishy to me." I never said this. I stated distinctly, when we put out these samples (see p. 80), that they were heavi-

er than we expected to make in the future; and later on (page 129) I stated that the walls were nearly three times as heavy as cell-walls of natural comb, but that bees would thin it down and make it as thin as the natural. Further on, Mr. Leahy believes the product will sound the death-knell of comb honey; that there is no advantage in the new article except to the manufacturers. In the first instance I have shown that Mr. Leahy has set up a man of straw, and, of course, knocked it over. In the second instance he has put forth fancy rather than fact. Practically the same claim was made in regard to foundation, and yet the foundation business has not hurt the honey business, but has been of great benefit to it.

In the same issue of the *Progressive Bee-keeper*, Mr. Doolittle editorially speaks in high praise of the new article, and winds up by saying: "Nor do I believe the Roots will risk their reputation on any thing which will injure the honey markets by pushing it to the front," and Mr. Hutchinson in the *Bee Journal* gives expression to the same sentiment.

In the *American Bee Journal* friend Bingham says of the new product: "Allow me to enter a protest against more wax in comb honey." Mr. Bingham had probably not seen what we published on p. 129, wherein we stated clearly that our object in the new product was to get less wax in comb honey. I don't believe he meant to accuse us of trying to do things that we are not; and further on Mr. Bingham says: "No one can blame the mixers for mixing low-grade honey; neither can they be blamed for buying drawn combs to put in bottles of honey. It would be no worse to put combs made of beeswax in honey than to put honey in such combs. As to such combs doing away with adulteration, nothing can so add to it." Mr. Bingham has fallen into the error of believing that the new article is drawn-out comb, and that it can not be distinguished from natural bee-comb. It is, in fact, nothing but deep-cell foundation with flat bases. The walls in any case will be less than half depth. The regular mixers would hardly think of putting such an article in honey, for it could be detected at a glance, and a transparent fraud won't pass.

In the same issue of the *American Bee Journal* Mr. Hutchinson still insists that, without trying it, the new deep-cell foundation is going to make a great "gob" in the mouth, and says: "I feel absolutely certain that its use will greatly impair the eating quality of comb honey;" that "the article will be tough and leathery." Why does Mr. Hutchinson speak so positively when he has not tried the comb from it?

Elsewhere in the same article he goes on and describes how he *thinks* the new foundation is made, detailing Mr. W.'s *old* experiment—how the cell walls are formed, and how the base is attached in some manner. Mr. Weed's original

method of making the article is very different from his present one. He now uses a press, similar in principle to the old Given machine, but uses hydraulic pressure instead. If the cell walls were formed, and the base stuck on, very likely it *would* make a "gob" in the mouth. And here I don't believe, either, that Mr. Hutchinson *meant* to cast discredit on a thing by attributing to it certain qualities which it had not, and by telling how it was made when he didn't know any thing about it. Further on Mr. Hutchinson says, and very truly, "Great was the kick against comb foundation when it was first introduced." Exactly; and it *looks* as if history were going to repeat itself on a small scale.

The brethren must not forget that we had been experimenting with this thing for about a year before we made it public. The quality of the comb honey, and the manner in which the bees accept the comb, have led us to put into it hundreds of dollars. We do not even now claim that we shall be able to put it on the market at such prices as will be within the reach of bee keepers—the future will have to decide that; but we are in *hopes* we can. And please remember, too, that we consulted *beforehand* some of the brightest and most intelligent bee-keepers in the country, to whom we submitted samples. Among them I may mention such men as G. M. Doolittle, R. F. Holtermann, P. H. Elwood, Dr. C. C. Miller, Hon. George E. Hilton, M. H. Mendleson, Byron Walker, Geo. W. York, E. Whitcomb, besides all our local bee-keepers. Some of the men saw the machinery, and saw the product in the hives, and the product after it came out.

You may depend upon it, brethren, that we shall not put upon the market any thing that will in any way injure the comb-honey business; and friends Hutchinson and Doolittle have our thanks for backing up the statement. If we were to do so we should be doing ourselves more injury than any one else—mark that.

#### IMBEDDING FOUNDATION ON WIRES BY MEANS OF ELECTRICITY.

HAVING recently made some improvements in our electrical imbedding outfit, and having prepared new directions and new engravings, we thought our readers generally might like to see how the job is done. The work is executed very much better and more rapidly than by the old-fashioned tracing-wheel plan.

#### DIRECTIONS FOR OPERATING BATTERY FOR IMBEDDING WIRES IN FOUNDATION.

Into a wooden pail pour about two gallons of boiling water, and empty the accompanying package (1 lb. bichromate of potash). Stir it well, and allow it to become dissolved. This may take several hours; then pour in half a pint of sulphuric acid. In pouring this in, be careful to pour slowly, and do not get any of the acid on the fingers or clothing. It is hardly safe to ship this, and you will, therefore, have to get it at your nearest drugstore. Now procure a couple of gallon crocks, such as are used for holding butter. As these can be bought

for a few cents we do not ship them, on account of their being bulky and heavy, and liable to break the delicate carbons in the package during shipment.

Into each of these gallon crocks pour an equal quantity of the solution. Place them on the bench near where you expect to work. Into each jar set a plate (Fig. 2) with its set of carbons, letting the plate itself rest on the top edges of the jar. Now insert the two zinc plates (as at Fig. 3). By means of one of the wires, connect the zinc (A Fig. 2) of one of the jars to the cast iron plate of the other (at B Fig. 2). Next fasten the terminals of the imbedding-fork (Fig. 4) to the two remaining screw connections—one wire at B Fig. 2 in one of the plates and one at A of the other. If you have done your work right, one wire of the fork will be attached to one zinc and the other to one cast-iron plate, and one wire will connect the two batteries. In the cut the wires are not connected right, although as there connected the batteries will work.

You are now ready for work. Lay a wired frame on the bench; over this a thin sheet of foundation, letting it come directly in contact with the wires. Now press the two feet of the fork (just in-side of the end-bars, Fig. 4) down on two opposite ends of one of the wires or strands as shown in Fig. 1. This will cause a current to pass through that strand, and heat it. The moment the contact is made, press the fingers of the other hand along the wire until it begins to show through. Lift the fork up, and in the same way imbed the next wire. A mere stroke of the fingers back and forth once ought to cause the wire to sink into the foundation. Proceed thus with all the frames you have, after which lift the zincs out, as they corrode and waste away.

When one set of zincs is used up, take the others out and fasten them between wooden cleats, as the first set was, and connect on the binding-posts. When these are used up, ask your tuner to cut some pieces from his scrap zinc, same size. About once in 100 or 300 frames it may be necessary to pour in a little more sulphuric acid to "tone up" the solution. Sometimes a little stirring of the liquid will answer the same purpose.

We send along a few extra carbons (black sticks), so that, if any are broken in shipment, they can be replaced. A little melted wax or paraffine should be painted around the carbon next to the iron, to prevent the salts from creeping up after the battery stands.

The zincs will work better if coated over with mercury. To do this, get a little muriatic acid; moisten a rag in it, rub it in mercury (a few cents' worth), and then rub it on the face of the zinc. This will give the zinc a coating that will make it last longer.

The accompanying imbedding-fork (Fig. 4) is made to fit a Langstroth frame with the wire strung as shown in the accompanying frame (Fig. 6). If your frame is odd sized, or if you use the L frame and wire perpendicularly, it will be necessary to change the distance between the feet of the imbedding-fork.

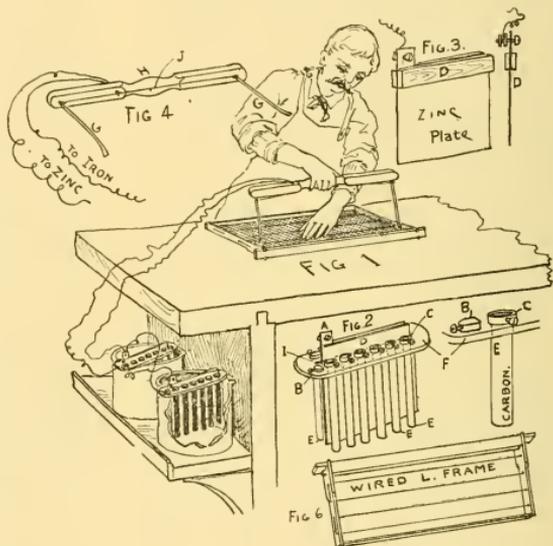

Keep all wires and battery connections clean, and be sure the zincs do not touch the iron or the carbons.

If the wire heats up quick enough to melt through the foundation, lift the forks off the wire quicker.

Some of our readers of an electrical turn of mind may prefer to make their own outfits. The carbon sticks are the ordinary electric-light carbons, and are fitted into holes in a cast-iron plate, and held secure by set-screws—see Fig. 2. There is a slot in the plate between and parallel to the carbon sticks. This is to admit the sheet of zinc. A piece of inch board

having a parallel row of holes for the carbons may be used instead of the cast iron; but the carbons must all be connected together by a naked copper wire wound around each carbon at the top. But this home-made affair is not nearly as effective as the cast-iron plate with its set-screws, for the latter make what is known as "good electrical contact."

Fig. 4 is the imbedding-fork. It is a strip of wood as long as the brood-frames. In each end is fastened two heavy iron wires flattened at the ends. To these wires are attached the battery-wires running along the groove J, uniting and passing through a hole near H.

The zinc plate is made of ordinary sheet zinc cut as shown in Fig. 3. Two strips of wood, as at D, are held in place by shellac or glue. It won't do to use nails, as the heads and points might stick through and touch the carbon, and so "short circuit" the battery—that is, spoil it. The theory and practice is, to send a sufficient current through the wire to heat it. Once heated, it is an easy matter to imbed it into the foundation.

MR. E. B. WEED, THE INVENTOR AND EXPERT WAX-WORKER.

It would be a revelation to some of you if you could see the improvements that have been made in making comb foundation. The old way was to dip a thin board into a deep vessel of wax enough times to secure a sheet on both sides. It was then cooled in water, and the film stripped off. It was next run through the mills piece by piece, and each time it was necessary to "pick" and "claw" at the ends

of the sheets sticking to the rolls as they came through. This operation did not improve the face of the mills, or the foundation. After the sheets were milled they had to be piled up, and cut to a size by hand, causing anywhere from 25 to 33 $\frac{3}{8}$  per cent trimmings that had to be melted over again. Last of all, the sheets were papered by hand and made ready for boxing.

Now if you were to peek into our wax-working department you would see an attendant pick up a big cake of yellow wax (60 lbs.) and set it into the machine, as it were, and when he leaves it and goes about other work. After it comes out it is converted into a long continuous sheet rolled up on a bobbin. This bobbin is then put into another automatic machine by the same or another attendant; the machine is started, and when this long bobbin of wax begins to unroll it is fed into the comb-mill, and is cut to size *without waste*. There is a click-clack, and the trimmed sheet is next made to lie squarely over a sheet of paper of the same size as itself, and pick it up; another click-clack, and it takes a hop, skip, and a jump on to the pile; and fingers almost human, but as lifeless as your barn door, true up the pile as evenly and nicely as you could do it with your fingers.

MR. E. B. WEED.

Nearly all of this is the result of the brains of one man, Mr. E. B. Weed, whose picture I take pleasure in presenting at this time. If he had done no more, his happiness would be all but supreme. But he is the inventor of the new deep-cell drawn foundation, to which I have referred in former issues. Even before he came here he was the inventor and patentee of a number of other articles, one of which I know he sold for a round sum.

Like every inventor, he has had his discour-

agements. His machinery and his appliances for wax-working all seemed to fail to work until he ran across the skilled employees of The A. I. Root Co., and the confidence of the firm itself in his inventions. Many and many a time it looked as if failure was *sure* to meet him as it had done when he worked for others having less confidence in his wild (?) schemes; but Mr. Weed, undaunted, and with a hope almost superhuman, and with the assurance that our firm would back him, would work and plod away until success was his.

When trying to solve a problem I have seen him so excited, and so thoroughly absorbed, that he scarcely knew what was going on about him. I remember once when one of his machines got into a "balky spell" (at the start they all had 'em). In order to make his kid "come to time," as he called it, in passing to the other side of the machine he collided with one of the women-folks carrying a pile of wax—knocked the pile over, and the woman too, nearly, but scarcely seemed to realize that he had had a collision and scattered the nice wax all over the floor. I have seen an idea seize him so quickly when walking, that, when he turned about face in his sudden, nervous way, his feet slid out from under him, and down he went in an ungainly heap. But he quickly regained his feet, and, so absorbed was he, that he seemed almost totally ignorant of the episode; but *he had the idea*; and notwithstanding I was convulsed with laughter he went on to tell me what it was; and as I continued laughing he innocently asked what I saw so funny.

During the last few days, Mr. Weed has been fussing (I guess that's the word) with a machine that would *not* do his bidding. It had balky spell after balky spell. He *knew* it *would* work, but was so tired out when I came into the room that he could not think any more, much less see where the naughty "kink" was. The next day, after a night's rest—if, indeed, he rested at all—he went at it again with a determination that I knew meant the machine had *got* to work, *and it did*; and to-day he sees the triumph of his perseverance and skill with that particular machine. The benign smile that now plays upon his face is contagious, for one can not but admire such pluck.

While he does not profess to be a mechanic, he seems to have a remarkable perception for mechanical possibilities. He will grasp an idea in an instant (he doesn't always tumble down). As indicative of his quick perception, he will take a whole page of reading-matter on the most abstruse subject, catch the whole idea, read every word of it in a tenth of the time it takes people generally.

Just where he will turn his inventive genius after he has made the wax business reach its summit, is hard to say.

## OUR HOMES.

Fear not them which kill the body, but are not able to kill the soul; but rather fear him who is able to destroy both soul and body in hell.—MATT. 10: 28.

### THE CRUSADE AGAINST CIGARETTES AND TOBACCO.

In scanning the daily papers of late I have felt like saying, "May the Lord be praised that the United States of America is finally waking up to the fact of what the cigarette business is doing every day to kill off our boys, both body and soul, where it is allowed to go on unrestricted." The teachers of our public schools have become so well aware of the fact that it kills the intellect more speedily and surely than any thing else that has ever started up that they are making vigorous protests everywhere. Tobacco is surely bad enough in its effects on the mind of the boy in his teens; but cigarettes seem to be tenfold more deadly. Perhaps one secret of this is the fact that morphine or opium in some form enters so largely into their make-up. For years past we have had terrible stories of the baneful effects of the opium habit in China, and among the Chinese in this country. The manufacturers of cigarettes are so devoid of conscience that they have no scruple whatever. I have sometimes thought that, even if they actually *knew* the result of their work is death to our boys, still they would not hesitate so long as the traffic puts a few nickels in their pockets for each boy killed. I am making terrible statements, I know; but ask the teacher who has care of your children and of your public schools if I am not correct about it. Ask your pastor; ask your family physician; and if the latter is not addicted to the use of stimulants himself, I think he will admit what I say to be true.

One reason why cigarettes are used so much more than cigars is because they are cheaper; and the fact that a *very small* amount of opium put into each cigarette will teach the boys the opium habit is one reason why they are afforded so cheaply. It is a terrible thing for a grown-up man or woman to be an opium-eater; but how much *more* terrible is it to think of starting children ten or twelve years of age in such a practice! One State in the Union has already, in view of these things, passed a prohibitory law. They declare broadly that cigarettes shall not be manufactured nor sold in the State of Tennessee.\* It ought to stir the heart of every one of us to see the South taking the lead in such reforms as this. A similar crusade seems starting up all over our land. A letter right before me gives us a glimpse of what has been done:

*Mr. A. I. Root.*—Your good friends Dr. Miller, of Marengo, Ill., and Mr. York, of Ravenswood, became interested in the great fight our Christian Citizenship League is making against the tobacco habit. I am now here in the interests of a bill absolutely prohibiting the manufacture and sale of cigarettes in the State of Illinois. The next issue of the paper of which I am editor will be a special anti-tobacco number. Please write me briefly on receipt of this your plan for rewarding abstinence on the part of

\*In answer to an inquiry, we have just received the following in regard to the stand the State of Mississippi takes, not only in regard to cigarettes, but to cigars and smoking-tobacco:

¶The code of Mississippi imposes a tax of \$50 on each dealer in cigarettes and cigarette paper. This law practically excludes cigarettes from the country stores and from the villages. The code provides further, that if any person shall sell or give cigarettes, cigars, smoking-tobacco, or snuff, to a minor under the age of eighteen, without the consent of parent or guardian, given in writing, he shall be deemed guilty of a misdemeanor, and punished by fine or imprisonment. Code of 1892, Sec. 1065. T. S. FORD, Srauton, Miss., March 2.

tobacco-using bee-men. It will make a good point for the paper.

Should you be blessed with something to help us in the expenses of getting out our large special issue it will be most gratefully received. You could find no other avenue through which the money could do more for the cause which, I am told, is near your heart. Yours for clean manhood,

(MISS) LUCY PAGE GASTON,  
Ed. *Christian Citizen*.

Springfield, Ill., Feb. 24, 1897.

In answer to the above, permit me to reply briefly, not only for the benefit of the writer of the above, but that the older readers of this journal may know something about the crusade that GLEANINGS started against the use of tobacco, and has kept up for almost twenty years past. It started something in this way:

I was visiting a young bee-keeper, and he lighted a cigar before attempting to open one of the hives. I remonstrated, and he said he was not in the habit of smoking; in fact, about the only time he used a cigar was when he wanted to handle his bees. I told him if he would throw away his cigar, and promise not to use tobacco again in any shape or manner, I would give him a nice new bee-smoker. In this he could use rotten wood, and therefore would not be obliged to have tobacco around in any shape.

"But suppose I should get back to using tobacco again—must I then give you back the smoker?"

"No; but you may pay me the price of the smoker."

As there were several other bee-keepers and others near by, this occasioned some merriment.

Another young man said, "If I promise to give up the use of tobacco may I have a smoker too, on condition that I pay for it if I ever go back to the tobacco habit?"

I told him he could have one on the same terms. If I remember correctly, a mother or a sister gave me a bright encouraging smile at about this juncture. The incident was related in GLEANINGS, and I made the offer to all its readers, that every tobacco-user who would take a pledge similar to that above, and have it published in the next issue of our journal, could have a smoker on the same terms; but if he went back to using tobacco he was to pay for the smoker, and also permit us to publish his letter acknowledging his going back to the habit. This was a very simple thing, but it seemed to strike bee-keepers at large just right. For many years quite a string of pledges was published in each issue of GLEANINGS; and a little later on we had enrolled a number of lawyers, doctors, and ministers of the gospel; and some pledges came from women in the Southern States, where it was then common for women as well as men to use tobacco.

When the calls for smokers began to come pretty thick and fast, some of the brethren said I might get "swamped," and have to back out of my offer of a smoker free of charge to any one who would give up tobacco. I told them I had no fears in that line; that the great God above would provide as many of the smokers, and stamps to mail them with, in such an enterprise for temperance and purity as I needed; and as I look back over the years that have passed I think I may truly say he has done so.

Several years ago when we hunted up, we found we had over a thousand pledges. We have not kept the number of those who afterward paid for their smokers, but there were very few comparatively. You see, when a man makes a public statement through a journal that is more or less read by his own family and the neighbors, he feels a little backward about going back to his old habit. As the price of the smoker we have been giving away is only

50 cts., or 70 by mail, there is not very much at stake any way. A man can easily be released from his promise if he should at any time so desire. Below are the conditions on which we have been sending these smokers during the past years:

First, the candidate must be one of those who have given up tobacco in consequence of what he has seen and read in this department. Second, he promises to pay for the smoker should he ever resume the use of tobacco in any form, after receiving the smoker. Third, he must be a subscriber to GLEANINGS. Any subscriber may, however, have smokers sent to neighbors or personal acquaintances whom he has labored with on the matter of tobacco-using, providing he give us his pledge that, if the one who receives the smoker ever uses tobacco again, he (the subscriber) will pay for the smoker. The one who receives the smoker in this case need not be a subscriber to GLEANINGS, though we greatly prefer that he become because we think he would be strengthened by reading the testimonials from time to time in regard to this matter. The full name and address of every one who makes the promise must be furnished for publication.

Before dismissing the subject of cigarettes I submit a letter from my daughter, Constance M. Root. The facts came under her observation while she was making a visit to the State Asylum at Columbus, for educating the blind children of our State.

During a recent visit to the Ohio Institution for the Blind, at Columbus, I found myself constantly wondering what had caused these boys and girls to be so afflicted; and on questioning the teachers and others I found that a great many of them were in that institution as a result of transgression of God's and nature's laws. The sins of the parents are being visited on their children.

But to me the saddest case in that institution is that of a young man who brought this terrible affliction on himself. He is the son of well-to-do parents, has had many advantages of education and refinement; but like many other boys he contracted the habit of cigarette-smoking while very young. He was working into his father's business, and had a great desire to appear manly. The habit grew on him to such an extent that he was seldom without a cigarette in his mouth during the day. When he was about eighteen years of age his health suddenly broke down, and for months he was in such a nervous state that he could not endure the slightest sound in his room. By the doctor's orders he was finally removed to a hospital, where not even his mother was permitted to see him. When he at last crept back to a degree of health his sight was hopelessly gone. He can see just enough to distinguish light from darkness, and to avoid running into people on the street; but his physicians say he can never hope to see more than that; and not only is his sight gone, but the poison of the cigarettes has injured his lungs to such an extent that it is very difficult for him to draw a long breath. He may some time completely regain his health; but his life seems blighted by the loss of his sight. I said, "seems blighted;" but that is only to those who are not well acquainted with him. He has recently become an earnest Christian, and I believe God has yet some work for him to do in this world.

I know he means to fight the tobacco habit in every way he can, and it is by his permission that I tell these facts; for although he is very sensitive, he is willing to have his sad story told if there is a possibility that it may keep some other young man from suffering what he has.

It may be well to add, that all the physicians who have had the care of him say that his blindness is undoubtedly the direct result of his cigarette-smoking. His physician published an account of his sickness and subsequent blindness in one of the daily papers in the large city where he lives, giving the cause as cigarette-smoking. One of the dealers in that part of the city said his sale of cigarettes had fallen off fifty per cent since that time.

#### THE PROGRESS OF THE CIGARETTE CRUSADE.

☐ We take the following from a recent issue of the Chicago *Advance*:

☐ The campaign against cigarettes is increasing in strength. Like most reforms of the kind, it is largely dependent on women; but women are a persistent power in these days, and they are pushing anti-cigarette bills into the legislatures of the various States. In Tennessee the governor has just signed an absolutely prohibitory cigarette law. The Connecticut law forbids the sale of cigarettes to persons

under 16 years of age. The Kentucky law makes the age-limit 18. The Massachusetts law, which is generally obeyed, forbids the sale of cigarettes to minors. The anti-cigarette law in Iowa was declared unconstitutional by the Supreme Court. In North Dakota a prohibitory law was passed two years ago, but it has remained a dead letter. In the Colorado legislature the lady members stood bravely for a bill to stop the sale of "coffin-nails," as cigarettes are appropriately called, but the male contingent of the body laughed the bill down. The Utah legislature almost unanimously killed the bill as soon as introduced, and the South Dakota legislature did the same. But these legislatures probably think that there are too many people in the world anyhow. In the Alabama legislature the House passed the bill, but it was defeated in the Senate by a trick. In a majority of the other States, bills are pending in the legislature, and they will slowly, but surely, get on the statute-book, for the cigarette is too deadly an enemy to permit this movement to go up in smoke.

#### NOTES FROM THE EVANGELISTIC WHEEL.

I was making calls in the village with the pastor. We called to talk and pray with one of his former deacons, now a well-known drunkard. Of course I was interested to know how such a terrible fall came about. The pastor told me the circumstances. He had been a drinking man years before, but had become converted, joined the church, became an earnest and consistent working Christian, and was finally elected deacon. All had nearly forgotten his former habits. One fall they had some cider in the house. The wife, a church member, and his grown-up son were drinking, and asked him to do so. He refused decidedly, whereupon they began to laugh at him, as a very weak and foolish man. They kept this up till, chagrined and mortified at what they called his weakness, he yielded, and drank the cider. From that time he has been a drunkard. A. T. REED.

The above should not only be a warning to us all, but it should be a *terrible* warning. I know it is true, because I have seen the same thing myself—yes, in my own neighborhood, here at home. It seems as if nothing could make people understand—even good Christian people—the danger that constantly hangs over the reformed inebriate. People have sometimes wondered what that strange passage in Matthew means: "A man's foes shall be they of his own household." The illustration that Bro. Reed has given us makes it clear. In following up the story of many a sad downfall, I have found that the victim was not nearly as much at fault as were his *friends*; yes, and many times the members of his own family. This poor man knew his danger, and very decidedly refused to tamper with the old temptation. His wife and his grown-up son laughed at him for his weakness. It was so long since he had been addicted to strong drink everybody had forgotten it. To them the idea was ridiculous and absurd, that he, a worthy deacon and Christian worker, should drink to excess. May God help us all. Dear friends, I have had glimpses of the bottomless pit, but it was long years ago. I often look back at those old times and wonder if it could really have been I—*myself*. The idea that I should long for or even think of anything so foolish and wicked! Why, it is absurd. I have often had this feeling; but, dear friends, within a single hour after, that old temptation has come back, and has towered above me like a veritable giant. As I felt his clutches closing down upon me I could only say as did poor Peter, "Lord, save, or I perish." Apples have been exceedingly plentiful, and no doubt cider is also, in many places now. Many good people drink it, and make sport of "temperance fanatics" because they refuse to touch it. Remember this sad story, and do not ever again urge anybody to touch or taste that which conscience tells him to let alone. And can't we go

a little further, and say with Paul, "If meat maketh my brother to offend, I will eat no meat while the world standeth"?"

Who redeemeth thy life from destruction, who crowneth thee with lovingkindness and tender mercies.

By some mistake my closing paragraph was omitted from our last number, and I have thought best to give it here:

After I got to feeling pretty well I felt troubled because my old interest and enthusiasm seemed lacking. Even when the greenhouses were doing their best along in the middle of February I did not seem able to scrape up much interest in seeing things grow, as I usually do. I prayed over this matter. I asked God to tell me what he would have me do with the strength that seemed slowly coming back. I wondered if it was his will that I should turn my thoughts to something else than to cultivating the ground, testing new plants, etc. Well, that prayer has been answered. I am now rejoicing in a degree of physical strength that makes it a pleasure to use my muscles. I am rejoicing, too, in enthusiasm and interest in all that is going on about me, especially in this matter that I have followed for so many years—cultivating the soil. I feel sure that I am doing the work God wishes me to do. And right here comes in that last part of our text, "Who redeemeth thy life from destruction." Without faith in God, where should we be? Then, again, how beautiful are those closing words, so full of promise—"Who crowneth thee with lovingkindness and tender mercies"!"

#### THE UNUSED FORCES OF NATURE.

Tempe lies about nine miles from Phoenix, on the opposite side of Salt River. After you cross the big bridge at Tempe there is one of the finest pieces of road for wheelmen imaginable. It is made of a sort of limestone found in the vicinity, and it packs down like asphalt. I frequently made the nine miles by moonlight. A good many times when I wanted to meet some of the bee-friends to get an early start, I would take the road by moonlight, before daybreak. When I had been there only a few days I started home late one evening from Phoenix. At the Half Way house one of the irrigating-ditches had broken through the embankment, and the road was covered with water. After picking my way around on the banks I got back on what I supposed to be the main road. I began to think after a while that things looked rather strange, even by moonlight; but I thought I would push ahead until I found a cross-road to make my way back to my route. No cross-road appeared, and I knew by my wheel that I was ascending at a pretty good speed. With such beautiful roads, however, it was not at all difficult. Finally the roar of one of the waterfalls on the great canal admonished me that I was getting away off in the wilderness, and it was also getting to be pretty well along in the night. I stopped at a house and inquired. The people were just going to bed; but our host opened the door an inch or two, and, after looking me over, he evidently concluded I was telling a straight story. In these regions they have reason to be a little suspicious of strangers who come around

after bedtime. He said there was a cross-road, and that I had come past it; but that if I would follow along down the banks of the canal I would reach the Tempe bridge, without any difficulty.

Now, I do not know how many waterfalls I passed by on that wonderful road. The sound of rushing waters is always inspiring to me, and under the light of the full moon every thing seemed weird and romantic. The mountains that loomed away up in every direction I might look; the huge cacti, as tall as telegraph-poles, and the different features of the desert, made me feel like building air castles. Shall I tell you of the air castles I built? This irrigating-canal has been pouring great volumes of water over these numerous waterfalls year in and year out for I don't know how many years past. Waterfalls are placed along at intervals because they want the water lower down. Any one of them was equal to the task of moving a turbine wheel that would furnish power to light the whole city of Phoenix, and perhaps run all her electric cars besides; and yet these falls are scarcely five miles from the city. Wood and coal here cost tremendously. Nobody has as yet ventured to make the connection.

A few days later somebody told me that, within about three miles of Tempe, there was a fall of forty feet in the water of the great irrigating-canal; that a company was organized, and they were already putting in an electric plant. Romeo (my brother's son) and I mounted our wheels, and were soon on the ground to investigate. Sure enough, there was a turbine wheel of 200 horse power already in place. The man in charge invited us to go down inside of the great water motor and see how it was made. While we were talking he seemed a little surprised at my enthusiasm in the matter, and—what do you think? Why, he is a bee keeper, has quite an apiary in that neighborhood, and had just been reading a bee-journal when we came up. He told me the turbine was exactly like those in use at Niagara Falls. They expected to turn the water on in a few days. While they were waiting for the necessary apparatus to convert the power into electricity they were going to use this great water-wheel to pump more water from a well just sunk in the gravel near by. You see, where there is a considerable fall in the irrigating-canal, and at the same time not enough water in the canal, they are going to take the power of the waterfall to lift more water from a lower level.

Now, with your permission I wish to digress from my travels just a little. Salt River Valley, Arizona, is not the only place where immense volumes of nature's forces are going to waste. The wind that is blowing over the roof of your house while you read this can be harnessed with little trouble and expense. It will light your homes with the most beautiful light in the world; it will warm your rooms and cook your food; turn the coffee-mill, grindstone, operate the churn, saw the wood, shell corn, and crack wheat—see page 170. What will it cost? Well, great factories are at work making short cuts to reduce the cost, every day. In fact, while I write quite a busy little factory is running on our own premises, for the manufacture of electric motors and dynamos. It is called the Ahm-Edwards Electric Co. You can get one of their circulars by addressing them at this place. Last week they showed me a little dynamo not much larger than a good-sized watermelon. If I am correct, it takes one horse power to work it, and it will run twenty lamps of sixteen-candle power each. The price of this machine is now reduced to about \$70.00. To light your house by wind power you will

need a storage battery to operate when the wind does not blow. I do not know at present who furnishes these storage batteries; but I think the Aermotor folks, of Chicago, can tell you.

#### NOVELTIES IN THE WAY OF NEW FRUITS, ETC.

Like all the rest of you, I have been reading the new catalogs with great interest. I have been looking anxiously for reports in regard to the new fruits, more especially the Strawberry-raspberry, Golden Mayberry, and Logan berry. These three wonderful new fruits have been before the public for several years, and yet almost every catalog continues to repeat the stereotyped extravagant description made by the originator or introducer. The plants now are offered at a very low price—say 10 or 15 cents each. Some of the catalogs assure us that these plants will bear fruit this year; but I have not yet found one where the proprietor says he has grown the fruit on his own ground, and that the claims for it are true. Now, gentlemen, what is the trouble? If they can be grown so easily, and bear such loads, and even produce some fruit the first year, why can't you tell us something about it from your own experience? Are we to infer that the men who make the catalogs never go out into the garden at all? or don't they have any garden? I purchased all three of the above when they first came out, and I have been nursing them along ever since; but I have never yet succeeded in getting one of them to us as much as blossom, neither have I seen anybody who has succeeded any better than I have. If any of the readers of GLEANINGS have got these plants in fruit, especially this Golden Mayberry, that ripens ahead of strawberries, will he please stand up and tell us about it? Just one thing more:

You know what a stir GLEANINGS made three years ago about the new forage plant *scaline*. Well, a great part of the catalogs still copy the extravagant claims that were made for this plant—"grows from ten to fourteen feet high by June;" "stems or leaves, green or dry, relished by horses, cattle, or sheep;" "more nutritious than clover, millet, corn, or any other forage plant." Now, all this has been paraded before us in our catalogs for three years. I purchased some of the first plants sent out. I have tried them in our rich plant-beds, and have put them out in the fields; I have tried them on various pieces of rich ground, both wet and dry, and I never yet have succeeded in getting a stalk a yard high, to say nothing about doing it by "June." The plant blossoms, bears seed, and acts as if two or three feet were its normal height. It is worth just as much for stock as the common dock, which it so much resembles.

Now, I was just going to cast some severe reflections on the man who sent it out at 25 cents a plant, and the catalogs that still continue to boom it at ever so many dollars a pound for seed; but I think I will wait till somebody who sees this has a chance to assure me that he has succeeded better. It seems to me that our practical working people, gardeners, and fruit-growers should make a vigorous protest against these things. Why, the catalog men are killing themselves, so far as business is concerned, by hanging to these humbugs when our experiment stations have declared for the third season that

the claims are false and the plants utterly worthless.

At this season of the year, when all our space under glass is crowded to its utmost, not only is it desirable to have every foot of ground occupied as soon as a crop is removed, but in planting seeds we can do still better. Let us take tomatoes for an example. We plant the seeds in rows four or five inches apart. Now, as soon as the plants get fairly up, make a little furrow between the rows of plants, and put in some more seed. By the time the older ones are ready to be transplanted to another place where there is more room, the second lot will be just coming up. In this way we can have a growing crop all the while on the same ground. At this time of the year we cut a little strip of lettuce every morning for the day's sales. This strip is always cleaned off at once, the ground nicely sifted and smoothed over, and seeds or plants usually got right in the same day, and often during the same hour the lettuce was taken off. Where we go to the expense of having sub irrigated beds, with heat underneath, it is all the more important that every foot of ground, as I have said, should have a growing crop on it all the while. When it gets warm enough so we can plant stuff in beds without heat, then it is not so very important; but still it is an excellent idea, after one goes to the expense of having beds made, and providing sash, to keep both beds and sash earning some money every day in the week.

#### THE CRANDALL CURRANT; SOMETHING IN ITS FAVOR.

*Friend Root*:—In the GLEANINGS of Dec. 1, Mr. Anderson, in speaking of the frauds in small fruits, classes the Crandall currant among them. Now, I have seen this currant fruiting for some years, and I do think it has a place among our small fruits. In the first place, it is not the black currant (*Ribes nigrum*), as Mr. Anderson says, but a fruiting form of the yellow or flowering currant (*Ribes aureum*). The flowering currant is a well-known old-fashioned shrub which is planted quite largely for its beauty, blossoming very early in the spring, with yellow, pendulous blossoms, very handsome and fragrant. It is quite a honey-producer too; but the bumble-bee seems to monopolize it. The corolla is very long, and the flower very much unlike the black and red currant *Indica*. The gooseberry flower is much more like the red and black currant. I succeeded once in crossing the gooseberry and black currant, but could do nothing with the yellow and black currant. I always thought if I had a piece of my own I would plant a few of the Crandall currants for their beauty when in flower, and then for the fruit, which is very good for pies, jellies, etc., and it hangs on the bushes quite a while after ripening, and does not ripen up all at once; so the fruit is in season for a month or so.

*Prof. Bailey*, in Bulletin 15 of the Cornell Station, says of it: "It represents a new type of small fruits, which, when further selected and improved, will become a staple."

This currant was introduced in 1888 by Frank Ford, of Ravenna, O. It has no doubt been overpraised by word and picture in the catalog of those dealers who make a business of doing such things; but its good qualities will give it a place among our small fruits, for I certainly believe it deserves one. Columbus, O., Jan. 18. [E. C. GREEN.]

*Friend G.*, I am very glad of what you say. When the Crandall currant first came out I paid a big price for a single bush. It is now higher than I can reach, but it has never given us a handful of fruit; and, in fact, it looks almost exactly like a bush of yellow flowering currant in our garden, purchased some years ago of Storrs & Harrison. The fruit of the two is exactly alike, only that of the Crandall is considerably larger. The Crandall has our very richest market ground, and it is a perfect mass of bloom every spring; but there is only a currant here and there, and very few ever reach

maturity. We have seen half a dozen berries, perhaps nearly the size of a Concord grape. If any of our readers have a bush or bushes of the Crandall bearing crops of fruit, I should be very glad indeed to hear from them. A great many others have reported an experience similar to my own. It has been suggested that some of the plants are non-bearing, so that one needs half a dozen or more in a group to get fruit.

#### THE FUEL VALUE OF CORN.

The Nebraska Experiment Station has been making some experiments in regard to this matter; and, as nearly as I can understand, the result is something like this: When you are offered 12 cts. a bushel for unshelled corn, counting 70 lbs to the bushel, and coal is worth \$6.50 a ton, you can afford to burn the corn instead of buying the coal. The estimate of 1 lb. of coal is that it is equal to 2 lbs. of corn; or, to speak exactly, 1.9 lbs. Even if this be true, it seems almost wicked to burn the corn, especially while millions are starving over on the other side of the world. Just now it looks as if we wanted cheaper methods of transportation as well as more of the missionary spirit to go with it.

#### CRIMSON CLOVER.

At this date, Mar. 15, our crimson clover is a "thing of beauty" and a "joy" to at least one individual. I am glad to say that there are acres of it where we dug our potatoes that are a perfect mat of green. Not a leaf has been injured, and the clover has made a considerable growth since the first of December. There is no question about it, it has grown wonderfully during the months of December, January, and February. Of course, we are not *entirely* through the winter yet; but from what experience I have had with the plant, I can not for a moment believe that this thick heavy mat is going to be thrown out by the frost. The stand is just about the same on our creek-bottom land, on some that is a little higher, and clear up on the hillside by the windmill. I am a little surprised that it should winter with us season after season, when so many other parts of Ohio report failure. Of course, our land is very rich. The seed was put in after digging a crop of 375 bushels of potatoes to the acre. The last was sown about the 15th of August, but it looks just about as well at present writing as that put in a month sooner.

back of and adjoining that is the closet, a vacant space of about 20 feet, and then comes the barn. You will see by this that the closet is far enough away from the house, yet we don't have to go outside at all to get to it. The closet is boarded and battened up tight, so that not a single crack is left for the least bit of snow or rain to beat in. There is a small window at one end to admit light. A ventilator runs from the under side of the top of the seat up through the roof. As the seat has accommodations for two, a couple of large galvanized pails are made to stand under the seat. I formerly used a drawer in here; but since reading Mr. T. B. Terry's explanations of his closet, in "Our Farming," I have used the pails, which I find to be far better. Not allowing any of the liquid to soak in as did the boards in the drawer, they can be kept much sweeter. Of course, they have to be emptied oftener; but having the stable so near the closet, it is a very easy job to raise the top of the seat, which is on hinges, and lift out the pails, and empty them into the manure-pile at the stable. It is then drawn away with the manure to the fields.

The most comfortable part about our closet is, we have the whole of the seat covered with a nice piece of brussels carpet, and I can tell you it is almost a pleasure to go there at any time of the year. A bin at one end holds the absorbent; and after trying all the absorbents I have heard of, such as dry earth, road dust, ashes, lime, etc., I have not found any thing so good as *dry sawdust*. It is clean to handle, absorbs all the liquid, and keeps down the smell better than any thing else I have used. In fact, there is hardly any smell at all when it is used liberally.

Having occasion to visit quite a little through the country, I have been amazed at the large number of places where there is scarcely any attention paid to the comfort of such places. In fact, in many places where I have been there has been no closet at all; and at others, the places they did have were veritable death-traps, with cracks open and doors off their hinges, and snow drifted all over every thing, and the owners wonder how it is they catch cold so often. I tell you, I am nearly always glad when I return home from one of these trips, where I can enjoy the comforts provided by a little forethought in laying out buildings and surroundings so as to be handy as well as comfortable; and why can not farmers and bee-keepers have such places when they cost so little compared with doctors' bills and other "ills"?

Of course, every one can not have these places fixed just like the one described above; but, dear reader, can you not improve considerably on the surroundings you now have? I should like to go on and tell you how, in my eighteen years of married life, I have, through sanitary measures, been able to live and enjoy life with an expenditure of less than fifty dollars for doctors' bills or medicine for myself and family. But this is not bee literature, and perhaps yourself and readers would not enjoy it as much as I do.

JOHN MYERS. □

Stratford, Ont., Can.

## Health Notes.

#### WATER CLOSETS; DRY-EARTH CLOSETS, ETC.; SOME GOOD SUGGESTIONS FOR OUT-BUILDINGS FOR RURAL HOMES.

*Mr. Root.*—I was greatly pleased with what you say in regard to closets, in Health Notes, page 868, Dec. 1; and while the water-closet you mention is all right, and perhaps the very best kind that is used at the present time (and I would strongly urge all who can afford it to use no other kind), there are many persons, especially in rural districts, who can not afford to have a windmill and tank; and the closet you mention is of no use whatever without water. To this class of persons I should like to describe my plan of closet, as used by myself and family.

I think it is fully conceded, that, next to the water-closet proper, the dry-earth system is best; and for rural districts or villages, if properly built and rightly used, they are about all that is required. My house, of course, faces the road. In the rear of the house proper is the kitchen, and in the rear of this is the summer kitchen; immediately in rear of the summer kitchen is a wood or coal shed, and just

My good friend, before I got to the end of your excellent article I made up my mind that you lived away up north somewhere; but when I got through I smiled just a little to find that you are really a Canadian. I do not know why it is, but it has sometimes seemed to me as though the further one goes south the less attention is paid to this matter of tasty and attractive as well as convenient closets. When you get down in Florida—yes, and out in Arizona—some very stylish and modern hotels have their closets away off somewhere in the back yard, and not at all in keeping with the other appointments of the hotel.

You have suggested a very simple way of getting rid of the contents of the galvanized bucket or pail. Whenever it has been suggested that these should be emptied on the garden I have always felt as though it was not quite the thing. Neither the average hired man nor anybody else fancies the job; and, besides, unless the contents are immediately plowed or spaded under, it is a very unsightly feature around the home. In winter time almost the

only place is, as it seems to me, the manure-heap, and it is but little work to incorporate it thoroughly with the stable manure. But not everybody has a stable. In my little book, "What to Do," I suggested having an all-metal wheelbarrow. Have the closet so made that the wheelbarrow may be wheeled in from the back side, so as to stand directly under the seat. Such a wheelbarrow can be made to hold the accumulations of a month or more; and once a month somebody can take a spade and spade it under out of sight in the garden; but when the garden is frozen up, what then? Will some reader of GLEANINGS help us out? I like the metal-wheelbarrow arrangement, because one need not touch any part of it except the projecting handles.

Once more, our good friend from Canada has given us the very best absorbent, in my opinion. Before we had the water-closet we now have, we used ashes or road dust. Mrs. Root objected to both, because, whenever you throw down a shovelful, unless you are exceedingly careful a cloud of dust rises up; and unless the seat is carefully dusted off, your good clothes will get a dusting, to say nothing of that nice new brussels carpet friend M. speaks about. Well, now, the dry sawdust does not rise in a cloud like road dust or ashes. If possible, use hard-wood sawdust, for it is much better for the garden. The very small quantity needed, however, would not be very objectionable, even if it were pine. There is another objection to wood ashes: They quickly liberate ammonia from stable manure or any other kind; and along with the ammonia we have certain odors that are not altogether pleasant. Sifted coal ashes do very well; but with these we have the objectionable cloud of dust unless the one who handles them is very skillful and careful. I am glad to see so much interest in regard to this matter; for my suggestions referred to in the above article have brought out many communications, and several requests for more light on the same subject.

---

## Humbugs and Swindles.

---

### ELECTRICAL HUMBUGS.

I have not "let up" on Electropoise and similar quacks because they have been driven from the field, but because I concluded I had done my part in warning the public. Electropoise still continues to be advertised in a good many magazines, and especially by periodicals professing to be *religious*. Let them go on, and let God be judge as to whether such things are consistent with the Christian profession. My attention has just been called to the matter by a clipping sent me by Dr. Geo. E. Hailes, the man who has the American Tongan beans. Here is the clipping:

The English government has undertaken to check the manufacture and sale of electric belts, brushes, pads, etc., on the ground that they are sold on false pretenses, and warranted to cure diseases over which they have no influence.

□ That is the talk, friends. Let the government take hold of it. Our expert chemists and intelligent physicians can very easily decide (by experiment if need be) whether these traps have any effect or not on the diseases of the human family. It is an easy matter to decide whether there is any electricity whatever about the greater part of them; and I think it may be settled quite conclusively that they have no effect whatever on the patient, except through the agency of the imagination.

On page 171 of our last issue I spoke about sending for instructions for making a home-made windmill. I sent my stamps to Francis Casey, St. Louis, and in the instructions we read as follows: "The castings are worth \$4. Any one can get the castings by sending to the Mound City Dishwasher Co., St. Louis." In *Agricultural Advertising* for February we find the following:

The Newspaper Collection Agency of this city reports that their office receives claims against them at the rate of from one to six a day, ranging in amounts from \$5 to \$50, and in total to several thousand dollars. No efforts on the part of the Collection agency can get a settlement from the Globe people.

The advertising that they are sending out is for goods owned by the Globe people, and is placed in such names as "Mound City Dishwasher," U. S. Fruit Co., J. F. Casey & Co., and Miss A. M. Fritz. On inquiry at the addresses given, it was found that no such firms existed, but that the Globe people got mail there in those names.

□ Permit me to repeat, that all this class of communications to newspapers, telling how somebody made great profits by selling a dishwasher, churn, or some similar thing, and that wind up by a pretense of wanting to benefit their "brother farmers" or hard-working sisters, are probably frauds. They try to get these communications inserted among regular reports from farming people or their wives. Where the editor of the newspaper has little or no conscience he will put it in the general reading-matter if he gets paid for it. Sometimes he puts it in *without* getting pay for it, as you will see in the above. But even if the editor insists that it shall go in the regular advertising department, and under the head of advertisements, he is, in my opinion, more or less a party to fraud and deceit; and, worst of all, he is helping to defraud the very people who are obliged to sell their corn, oats, and other produce at such ruinously low prices. It is not only wrong and unchristianlike, but the papers that help to push this kind of fraud, and try to shirk the responsibility, will find, sooner or later, that "whatsoever a man soweth, that shall he also reap." They will find that there is a surplus of some things in this world of ours besides corn and oats, and there is just now getting to be a surplus of periodicals. The editor who is not careful, not only of his reading-columns, but of his advertising department as well, will find a lack of readers, and a lack of *dollars* to keep his paper going. Great is truth, and will prevail; and our farming people are fast learning to hold the editor of their family paper responsible for the advertisements he sends into their homes. Any editor can with little trouble ascertain whether his advertisers are responsible men or *frauds*.

---

### WHO SHALL BE GREATEST?

On page 129 appears something that I did not see till it was in print — I mean that item as to who has done the most for the cause of apiculture in years past. Once upon a time the followers of our Lord and Savior were disputing among themselves. When he asked them what was the ground of their disagreement they all hung their heads down and said nothing; for the facts of the case were they had been disputing as to who should be greatest. Now, I hope it will never be necessary to have such discussions appear in the columns of any of our bee-journals. Shall we not seek to cultivate that beautiful virtue that "suffereth long, and is kind," "vaunteth not itself," and "seeketh not her own"?

## A Dollar Saved

is better than one earned. Read my 37th annual catalog, and don't send out West for goods you can buy cheaper here at home.

I have added 2400 feet of floor-space to my store-house and shall keep in stock Root's polished one-piece sections. Dovetailed hives, new Weed foundation, etc., in addition to my old line.

Best breeds of bees and queens at bottom prices. Don't buy until you see what you can do with me.

**W. W. CARY, Colrain, Mass.**

In responding to this advertisement mention GLEANINGS

## Our Prices are Worth Looking at!

IN THE

### New Champion Chaff Hive Especially.

All other supplies accordingly. Send for catalogue and price list. Address, mentioning GLEANINGS.

**R. H. SCHMIDT & CO., Box 187, Sheboygan, Wis.**

### MUTH'S HONEY-EXTRACTOR, SQUARE GLASS HONEY-JARS, ROOT'S GOODS AT ROOT'S PRICES.

Bee-keepers' Supplies in general, etc., etc. Send for our new catalog. "Practical Hints" will be mailed for 10c in stamps. Apply to

**CHAS. F. MUTH & SON, Cincinnati, O.**

## Early Queens By Return Mail.

Best tested Italians, \$1.00 each. Queens are vigorous, healthy, and prolific. The workers are unsurpassed as honey-gatherers. Send for price list.

**J. W. K. Shaw & Co., Loreauville, La.**

## The Cultivator,

Published semi-monthly at Omaha, Nebraska, is the leading authority on fruit grown in Nebraska, and on general agriculture in the West. Send for sample copy and free strawberry-plant offer. Address

## Cleveland Bicycles.

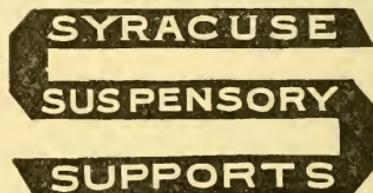

Every piece and part of the Cleveland Bicycle is made in our own factories by the best of skilled workmen, under most rigid inspection. The result is a Bicycle embodying, in a marked degree, features of safety, speed, and durability.

THERE'S HONEST VALUE IN IT.

We want the patronage of intelligent and discriminating buyers. 1897 catalog mailed free for the asking.

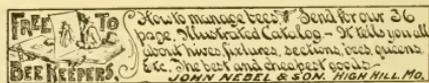

**H. A. LOZIER & CO.,  
Cleveland, Ohio.**

Send 4 cents postage for our booklet, "Shakespeare and the Bicycle." Two illustrations in colors by F. Oppen, of "Puck."

and protects the stomach, and should be worn in every case where there is any drooping of the scrotum. It is especially recommended to wheelmen, equestrians, base-ball, foot-ball, and lawn-tennis players, athletes, men doing heavy work, much walking or standing, etc. Ask your physician's advice about wearing a Suspensory—perhaps it will relieve your backache. Our \$1.00 grade is very popular, and your dealer, or we, will sell you one and refund money if not perfectly satisfactory. For sale by all druggists and dealers in athletic goods. Send for price list. A. J. WELLS MFG. CO., 250 Tallman Street, Syracuse, N. Y.

In writing to advertisers please mention this paper.

**EARLY QUEENS** from good stock (one yard averaged 420 lbs in '94) Have kept bees since '74; sold thousands of queens the past six years. Price \$1.00, March and April. Free catalog. J. B. CASE, Port Orange, Fla.

Are You Going to Buy

Apiarian Supplies or Bees?

If so, You Want the Best.

This is the only quality we offer. Our prices are right, and our '97 catalog describing them, and the management of bees, is yours for the asking.

We carry a large stock, and can ship promptly. Freight is a big consideration often amounting to 20 per cent of the value of goods. Let us quote you prices on what you need, delivered at your station,

Freight Paid.

They will cost but a trifle more than others charge at the factory. Our aim is to please.

Apiary, I. J. STRINGHAM,  
Glen Cove, L. I. 105 Park Pl., N. Y. City.

Don't Neglect Your Bees.

Bee-keeping may be made uniformly successful by judicious feeding. It is just as important with bees as with other stock.

Success in feeding depends very much on the feeder used. When you have tried the

Boardman Atmospheric Entrance-feeder

you will be convinced of this.

For descriptive circulars and price list, address

## Wants and Exchange Department.

Notices will be inserted under this head at one-half our usual rate. Advertisements intended for this department must not exceed five lines, and you must say you want your advt. in this department, or we will not be responsible for errors. You can have the notice as many lines as you please; but all over five lines will cost you according to our regular rates. This department is intended only for bona-fide exchanges. Exchanges for cash or for price lists, or notices offering articles for sale, can not be inserted under this head. For such our regular rates of 20 c. a line will be charged and they will be put with the regular advertisements. We can not be responsible for dissatisfaction arising from these "swaps."

Address W. J. FOREHAND, Fort Deposit, Ala.

**WANTED.**—Ten nuclei; also Craig Seedling potatoes at Root's price for sale. Address  
P. M. BYERLY, Farley, Dubuque Co., Iowa.

## Special Notices in the Line of Gardening, etc.

By A. I. Root.

OUR NEW SEED CATALOG FOR 1897.

This is finally ready to send out. It is twice the size of any of its predecessors, and embraces spraying-outfits, directions for using fungicides and insecticides on all sorts of plants and fruits; tools for gardening, etc. Mailed free to any address on application.

**BUNCH YAMS AND VINELESS SWEET POTATOES.**  
Either kind, 20c per lb. by mail (or 10c per lb. if sent by express or freight with other goods); 3 lbs., by mail, 50c; 1/2 pk., 40c; pk., 60c; bu., \$2.00; bbl., \$4.50. The vineless sweet potato is better known in some localities as the General Grant.

**FREEMAN POTATOES FOR TABLE USE.**

Mrs. Root has been making careful tests of all the new potatoes offered for sale, and there is no one of them equal to the Freeman—not even the old Snowflake, that has been given the highest place of all. If you have never tried the Freeman you should have at least a few from our stock grown by T. B. Terry. Choice potatoes, carefully selected for seed, are only \$1.50 per barrel; seconds, half price. The latter are just as beautiful for a baking potato.

**PREMIUM POTATOES TO OLD SUBSCRIBERS WHO RE-NEW.**

To every person who sends us \$1 for GLEANINGS, past, present, or future, where no other premium is called for, we will allow 1 lb. of thoroughbreds, or the same value in any of the other kinds in the list. But the recipient must pay all postage at the rate of 10 cts. per lb. for stamps and packing. Please notice in Kind Words in this issue the quantity of valuable potatoes that some of our readers secured last year from their 1 lb. of premium potatoes. Of course, you can have your premium potatoes sent by express or freight with other goods, and then there will be nothing to pay for postage.

**A BARREL OF POTATOES TO EVERY ONE WHO SENDS US A NEW SUBSCRIPTION.**

Every present subscriber to GLEANINGS who will send us a new name, inclosing \$1 for the same, may have as a premium a barrel of New Queen seconds, worth 63c. We do not make this offer because the New Queen is in no way inferior, but because we have a very large lot of them; and as it is an early potato it ought to be planted pretty soon. Of course, the one to whom the potatoes are sent must pay freight. If it is too much trouble for you to get a new name, make somebody a present of GLEANINGS for one year; but please remember that this exceedingly liberal offer is made solely

that GLEANINGS may be introduced into some family or neighborhood where it has not gone before. We can not send you the potatoes if you simply have GLEANINGS sent to some other member of your own family. It should go to some postoffice where it is not already taken. If you want some other variety of potatoes than the New Queen, each new name sent us will entitle you to a dollar's worth of Thoroughbreds or 50 cents' worth of any of the other varieties in the list. For list of other varieties, see our issue of Feb. 15, page 134.

#### OUTDOOR GARDENING FOR MARCH 15.

Just as soon as you can get a piece of ground so it will work either with the spading fork or plow, get in some Alaska peas and spinach. If you have room to put in some American Wonders beside the Alaskas they will come in about a week later. Don't forget spinach. It is as hardy as the peas, and I have never yet seen any market overstocked with good spinach. To produce a nice article, however, the ground must be exceedingly rich. In fact, you can not make it too rich. Spinach is now quoted in the city markets at about 75 cents a bushel. We usually get as much for it as for lettuce (say 15c per lb.) early in the spring; but to get this big price it must be started under glass. You want the ground rich enough so the leaves will be thick and heavy, and of that dark rich color which indicates extra good soil. We prefer the Bloomsdale Extra Curled, and can make the following low prices on the seeds: 1 lb., 15 cts.; 5 lbs., 60 cts.; 10 pounds or over, 10 cts. per lb. Our own ground is just plowed.

#### GOLDEN SELF-BLANCHING CELERY.

Ever since this came out it has been a favorite and staple variety, and there has been considerable said about getting a strain of seed equal to that first sent out by the originator. We have taken considerable pains in the matter, and have obtained a limited quantity of seed from Vilmorin, Andreux & Co., the originators of the variety. Now, we can not tell whether this is greatly or any superior to the best American grown; but we would naturally suppose that the originator would have the very best strain in his possession. We offer the best American grown for 20 cts. per ounce, or \$2.00 per lb. The seed mentioned above, imported direct from France, can not be sold for less than 30 cts. per ounce or \$3.00 per lb. Of course, we furnish five cent packages of each kind, but there are not so many seeds in the high-priced strain as in the other. We are making careful tests of both kinds, and will report in due time. If you order the high-priced, please state that you want the "Vilmorin" strain.

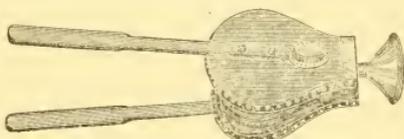

#### VEGETABLE-PLANTS READY MARCH 15.

We have a very nice stock of palmetto asparagus roots, one and two years old; plenty of nice horse-radish roots; Wakefield cabbage-plants once and twice transplanted. We have no cold-frame cabbage-plants, but we offer the twice transplanted at the same price. They are out in cold-frames, and I think they are fully equal to cold-frame plants. We also have a nice lot of cauliflower-plants and Grand Rapids lettuce-plants. We have no onion-plants ready to send out except winter, or Egyptian. These have been outdoors all winter without any protection, and can be planted now anywhere where the ground is not frozen, and will grow an abundance of onions for next spring. Price 15c per 100; \$1.00 per 1000; \$7.50 per 10,000. We can also ship promptly all the various kinds of strawberries we advertise. We have also a very nice lot of Victoria rhubarb roots at 10 cts. each; 50c for 10; \$3.50 per 100. Small roots can be sent by mail postpaid at the above prices. Large ones should go by freight or express. The rhubarb is very hardy, and if they should be a month on the way it would not hurt them any.

#### THE AMERICAN COFFEE-BERRY.

It seems there are several varieties of this new plant. Gregory in his catalog describes four kinds of soya beans. The coffee-berry is one of the four, and he gives it a very high recommendation for coffee. Breck & Sons also describe it, and give a picture of the plant full of pods, with a coffee-pot standing beside it; and, by the way, this coffee-pot picture is exactly the same one used by Cole of Buckner, Mo.; but we are not sure that Cole's American coffee-berry is the same as Breck's. The coffee-berry rec-

ommended by Gregory is dark-colored, and the beans are flatish. Cole's are round, and of a bright cream color. One may be just as good as the other; but ours ripens its crop easily in our locality before frost, and I think it is going to be a very valuable variety of soya bean, let alone its value for coffee. We have bought a larger lot of the same stock we had last season, and can now offer it, besides the five-cent packages as follows: 1/2 pint, 15c; pint, 25c; quart, 40c. If wanted by mail, add 15c per quart for postage. We hope enough will be raised during the coming year so that the present high prices may no longer exist.

INSECT-EXTERMINATOR.

At this present writing, March 15, we have still another powder-dusting bellows called the Insect-Exterminator. This machine, which consists of a long-handled bellows, so made as to get the powder all down on the ground, and away from the operator, promises to distribute Paris green, hellebore, or any other insecticide, almost as well as the Leggett and Hotchkiss machines, while the price is only \$1. Of course, we have not given it a practical test in the field; but in experimenting with it on common flour it throws the material in a little dusty cloud, and seems to be proof against clogging or stopping up, which has been the great fault of all the low-priced machines. Sent by mail for 25c extra.

#### THE TONGAN BEANS.

Our own vines grown in the greenhouse spread and covered a large area, and ripened quite a quantity of the beans, though not enough to test them for cooking purposes. At the time I introduced them a year ago I supposed there were none others like it in America. Since then, Mr. Geo. E. Hales, box 1147, San Antonio, Texas, has sent me samples of beans that so exactly resemble the Tongan, I concluded they could not be a different variety. They are grown in the South solely as an ornamental plant, and are there called "jack beans." Although they may be good for table use, they have never used them there in that way. From what I have seen of them I have no doubt that a single plant will produce a bushel of beans, but they would have to be grown in some locality where they would not be killed by frost during winter. I think friend W. S. Hart, of Hawks Park, Fla., has some plants that have wintered over. We can still furnish seeds at 5 cents per packet to those who want to try them. They can be grown here in the North so as to ripen seed before frost if they are started under glass. We have succeeded in doing so without any trouble.

#### THE BEET-SUGAR INDUSTRY, AND THE KIND OF SEED REQUIRED TO RAISE BEETS.

There is one special strain of beet seed not kept for sale by any seedsman in the United States, so far as I know, but it can be obtained only by importing it from Germany. You can all remember the name without any trouble, for it is "Kleinwanzlebener." We have none in stock, but have made arrangements so that we expect to have it in about ten days or two weeks. We can furnish it for trial in five-cent packages, or 30 or 40 cts. per lb.; we can not tell exactly until we know what the expense of shipping will be. The people at our experiment station, Wooster, O., recommend the Kleinwanzlebener (this is a special strain, and is "stock seed") above all others for the production of sugar—that is, where beets are grown for a sugar-beet factory. The Lane's Imperial sugar beet, which we have sold so many years, is also recommended by our station, and for feeding stock. This we offer at the very low price of 15 cts. per lb.; 5 lbs., 60 cts.; 10 lbs. or more, 10 cts. per lb. By the way, we are told that good beets, suitable for making sugar, can be grown all over Ohio, and probably in adjoining States.

#### THE UNITED STATES WEATHER BUREAU AT THE PRESENT TIME.

The weather people have been doing some excellent work of late. Since the first of March they

have made between 30 and 40 predictions, from 24 to 48 hours in advance, and so far not one single mistake. In some cases the prediction has been somewhat complicated. For instance, here is the telegram received at 10 a. m., March 12:

Generally fair Saturday, preceded by local rain or snow. This afternoon or to-night, cold wave; temperature will fall 20 or 30 degrees by Saturday morning.

Now, all the above took place exactly according to program. In fact, they have been telling the weather beforehand almost as accurately as one could write it down after it had past and gone.

#### BRITISH BEE JOURNAL.

We are receiving every week five extra copies of the *British Bee Journal*, for which we have no names to send it to. We shall be pleased to send these to an of our readers, who care for it, at 75c for the rest of the year 1897, and we will send you what back numbers we have as well.

#### WHOLESALE LISTS TO DEALERS.

As this number is being mailed we are sending out wholesale lists to dealers in bee-keepers' supplies whose names we have on our list. If you are handling our goods as a dealer, and do not receive one of these lists, write for it. We send it only to legitimate dealers and agents. Others need not apply.

#### WEED NEW-PROCESS FOUNDATION AND DRAWN FOUNDATION.

We shall be pleased to mail our new sample package of foundation, including a small piece of the new drawn foundation with deep cells, for 5 cents in stamps to cover postage and packing. This package also shows the quality and workmanship of our extra polished sections.

#### ELECTRICAL WIRE-IMBEDDING OUTFIT.

If you have very much foundation to put on wired frames, it will pay you to use this outfit. The saving in time and the nicety of the work will more than pay the extra cost. It includes a battery of two cells, chemicals, and all the necessary tools. The batteries heat one strand of the wire at a time, so that it sinks into the foundation by simply pressing lightly on the sheet on the reverse side. Directions for use accompany each outfit.

Price of outfit complete, \$2.50.

#### CARLOAD SHIPMENTS.

Since our last report a month ago we have shipped a carload to Wm. A. Selser, 10 Vine St., Philadelphia, who has charge of our supplies at that point, and who will, when desired, make shipments from New York City. A carload has gone to Jno. Nebel & Son, High Hill, Mo.; another big car to the Bee-keepers' Exchange at Los Angeles, Cal.; one to Buell Lamberson, Portland, Oregon. Besides we have shipped three carloads across the Atlantic—two for London and one for Glasgow. Orders are booked for four or five more cars which we expect to ship during the next ten days. While we have been a little behind on orders we are catching up, and hope by April 1 to be handling every thing promptly. Don't delay too long in sending in your orders.

#### MAPLE SUGAR AND SYRUP.

The delicious sweets of the sugar maple are already becoming plentiful in our market and we are able to offer a choice article of this year's make at lower prices than usual. We handled last year over 15 tons of maple sugar, and upward of 1000 gallons of syrup, so we are prepared to supply it in large and small quantities. We also guarantee what we furnish to be absolutely pure maple. Choice first-run syrup, in 1-gallon cans, we offer at 90c per gallon; 5 gallons, \$4.25; 10 gallons, \$8.00; 20 gallons and upward, 75c per gallon. Good clear syrup, not first run, at 5c per gallon less.

Choice first-grade sugar, 9c per lb.; good second-grade sugar, 8c per lb.; fair third-grade sugar, 7c

per lb.; 50-lb. lots 12c per lb. less; barrel lots of 300 lbs., 1c per lb. less. At these very low prices we ought to be able to supply large quantities. Your orders will receive prompt attention.

#### HONEY MARKET.

We have engaged, and offer for sale at very favorable prices, the following lots of comb honey, and shall be pleased to hear from any interested.

In North-western Pennsylvania, 400 lbs. of fancy white clover in 12-lb. cases, and in 200-lb. lots at 13c, or the lot at 12½ cts.

We have also three lots in Michigan, consisting of 300 lbs. fancy No. 1 white, in 12 and 16 lb. cases, which we offer at 12c per lb. for lot.

200 lbs. amber, which we offer at 10c per lb., and 200 lbs. buckwheat, which we will sell at 8½c per lb. in 200-lb. lots, or 8c for the lot.

Of extracted honey we have in stock a very choice article of clover and basswood in 60-lb. cans, 2 in case, for which we ask 7c per lb.; 2-case lots at 6½c.

We can also supply choice basswood honey, direct from Wisconsin, in 500-lb. barrels, at 5½c per lb. In 1-gallon cans; lots of not less than 10 cans, at 6½c; 50-can lots at 6c, or a ton at 5½c.

#### 4x5 SECTIONS IN THE 8 FRAME SUPER.

Those who wish to try the 4x5 sections in the regular 8 frame super which they have, without making any change in them, can do so in this way: Provide a rim of the same outside dimensions as the super, 13½x20, and ¾ inch deep. Attach a strip of tin to the bottom inside edge of each side of this rim. Procure or make 7-to-foot slats, ¾ in. thick, 12½ long, and slotted from end to end, or to within ¼ in. of the end. Wood separators 4½ wide, with one long slot on the under edge ½ inch deep, completes the outfit. You can put 30 sections, 4x5, into an 8-frame super in this way. If sections 1½ wide are used without separators, 33 sections can be placed in a super. We can supply these ¾-inch rims at 5c each; 2½ for 10; tin strips 19 in. long at 50c per 100; 12½ 7-to-ft. slotted bottom slats, 60c per 100; 4½x12½ slotted bottom separators, 60c per 100. This makes the outfit needed for a super cost 18c each, \$1.50 for 10; sections extra. If you have to buy the supers outright we recommend the regular Danz. equipment.

#### KIND WORDS FROM OUR CUSTOMERS.

Find enclosed 20c for 100 of the leaflets "Food Value of Honey," by Dr. C. C. Miller. We have baked several batches of honey-jumbles, and find them excellent. JOHN S. SNEARLY.

Williamsville, N. Y., Feb. 27.

#### GOOD REPORTS FROM THE THOROUGHBREDS.

I made 61 pounds of potatoes from the pound of Thoroughbreds that I received for a new subscriber. They had no manure or extra cultivation.

Isom, Maury Co., Tenn. J. S. WORLEY.

The 1 lb. of Thoroughbreds yielded 77 lbs. 11 ozs.; the 1 lb. of Craig yielded 23 lbs. 5 ozs. This yield is not large, the conditions not being favorable, but the immense superiority of the Thoroughbred is plainly shown. A. DAWSON.

Mohawk, Ont.

The pound of Thoroughbred sent me yielded 92 lbs. CLAYTON HOLL.

New Berlin, O., Feb. 22.

I expect to want some potatoes soon. By the way, I raised 100½ lbs. from one premium pound of Maule's Early Thoroughbred, in our garden, without extra fertilizer. MRS. M. A. SHEPHERD.

Barry, Pike Co., Ill., Feb. 27.

I received the pound of Thoroughbred potatoes, and raised 62 lbs. from it. A. R. TUTHILL.

Welcome, Minn., Feb. 7.

#### HOT-BED SASHES, ETC.

I wish to emphasize your method of putting the cold-frame sash together by using paint for the joints. It makes them more solid and durable. I prefer seed of your own raising, as I have had great success with them the past three years. Alexandria, Ind. EVAN E. EDWARDS.

Honey Column.

CITY MARKETS.

**KANSAS CITY.**—Honey.—No. 1 white, 12@13; fancy amber, 11@12; No. 1 amber, 10@11; fancy dark, 9@10; No. 1 dark, 8@9; white extracted, 5@5½; amber, 4½@5; dark, 4; beeswax, 25.

March 22. C. C. CLEMONS & Co.,  
423 Walnut, Kansas City, Mo.

**NEW YORK.**—Honey.—Fancy white, 11; No. 1 white, 10; fancy amber, 9; No. 1 amber, 8; fancy dark, 6½@7; No. 1 dark, 6; white extracted, 5@5½; amber, 4½@5; dark, 3½@3¾; beeswax, 2@2½. There are no new features in the honey market. Demand is fairly good, and stocks are gradually diminishing at unchanged prices. Beeswax quiet at 2@2½c, according to quality.

March 20. HILDRETH BROS. & SEGELKEN,  
28 & 30 W. Broadway, New York.

**MINNEAPOLIS.**—Honey.—Fancy white, 13@14; No. 1 white, 10@12; fancy amber, 9@10; No. 1 amber, 8@9; fancy dark, 7@8; No. 1 dark, 6@7; white extracted, 6@7; Western white, 5@6; amber, 5@6; dark, 4@5; beeswax, 22@25. Market unchanged, and quiet for both comb and extracted. Demand for the latter is well supplied.

March 20. S. H. HALL & Co.,  
Minneapolis, Minn.

**MILWAUKEE.**—Honey.—Fancy white, 12@13; No. 1 white, 10@11; fancy amber, 8@10; white extracted, 5½@7; amber, 4½@5; dark, 4@4½; beeswax, 20@27. The supply of honey continues very fair and the demand is moderate, and the best quality usually wanted, while the common qualities do not move. Hence the argument is in favor of improved conditions of package and quality of product. All choice will be taken, and the common left. Give us the best.

March 19. A. V. BISHOP & Co.,  
Milwaukee, Wis.

**COLUMBUS.**—Honey.—Fancy white, 12@12½; No. 1 white, 11; fancy dark, 8½.

Mar. 23. THE COLUMBUS COM. & STORAGE CO.,  
409-413 N. High St., Columbus, O.

**CINCINNATI.**—Honey.—No. 1 white, 12@13; No. 1 amber, 10@12; white extracted, 5@6; amber, 4@5; dark, 3¼@4; beeswax, 22@25. Demand slow for all kinds of honey, while supply is fair.

March 22. CHAS. F. MUTH & SON,  
Cincinnati, O.

**DETROIT.**—Honey.—Fancy white, 10@11; No. 1 white, 9@10; fancy amber, 8@9; No. 1 amber, 7@8; fancy dark, 7; white extracted, 5@6; amber, 4@5; dark, 4; beeswax, 24@25. There is little demand for comb honey, and quite a large stock in commission houses.

March 22. M. H. HUNT,  
Bell Branch, Mich.

**BOSTON.**—Honey.—Fancy white, 13; No. 1, 11@12; fancy amber, 10; white extracted, 7@8; amber, 6@7; dark, 6; beeswax, 25. Comb honey is selling very slowly, with a full stock on hand. Beeswax in good demand, with a very light supply.

E. E. BLAKE & Co.,  
March 20. 57 Chatham St., Boston, Mass.

**ALBANY.**—Honey.—Fancy white, 12@13; No. 1 white, 10@11; fancy dark, 7@8; No. 1 dark, 6@7; white extracted, 5@6; dark, 3½@4. There is a fair demand for both comb and extracted honey, and we are quite confident that we shall be able to close out all desirable stock without much trouble within the next four weeks.

CHAS. MCCULLOCH & Co.,  
March 16. Albany, N. Y.

**PHILADELPHIA.**—Honey.—No. 1 white, 8; fancy amber, 7; No. 1 amber, 6; fancy dark, 6; No. 1 dark, 5; white extracted, 5@5½; amber, 4½; beeswax, 26. Season for comb honey about over; dealers do not care to buy on account of warm weather so near. Extracted honey selling slowly; prices very low. Times are much harder here now than they have been all winter, and honey is regarded as a luxury.

W. M. A. SELSER,  
March 20. No. 10 Vine St., Philadelphia, Pa.

**CHICAGO.**—Honey.—Fancy white, 11@12; No. 1, 10@11; fancy amber, 9; No. 1 amber, 7; fancy dark, 8; No. 1 dark, 7; white extracted, 5@7; amber, 5@6; dark, 4½; beeswax, 25@27. Stocks are working down, but there is no improvement in price. The season for comb honey is drawing to a close. Any one intending to market in the cities should do so now.

R. A. BURNETT & Co.,  
March 19. 163 So. Water St., Chicago, Ill.

**ST. LOUIS.**—Honey.—Fancy white, 12½@13; No. 1 white, 11@11½; fancy amber, 10@10½; No. 1 amber, 9; fancy dark, 8; No. 1 dark, 7@8; white extracted, 6½ in cans, 5½ in bbls.; amber, 5½ in cans, 5 in bbls.; dark, 3½ in cans, 4½ in bbls.; beeswax, 23@25. For the past two weeks there has been a better demand for honey, especially on extracted. The prospective tariff on sugar, I think, is mainly the cause, as the demand is from manufacturers.

WESTCOTT COMMISSION CO.,  
March 20. 213 Market St., St. Louis, Mo.

**DENVER.**—Honey.—Fancy white, 11; No. 1 white, 10; fancy amber, 9; white extracted, 6; beeswax, 25. We can not quote better prices than the above for our market, and we will not give a false price to the readers of GLEANINGS.

R. K. & J. C. FRISBEE,  
March 24. Denver, Col.

**FOR SALE.**—A quantity of alfalfa extracted honey in 60-lb. cans at 5½c, f. o. b. here. Sample on application.

M. H. HUNT, Bell Branch, Mich.

**FOR SALE.**—6000 lbs. extracted honey, in new cans and cases, \$350.00. Speak quick; who wants it?

ELLIS FOX, Hillsboro, Wis.

**FOR SALE.**—\$25.00 for one 500-lb. barrel of A No. 1 linn extracted honey, F. O. B. cars here, or 5½c in packages of 60 lbs. each.

J. B. MURRAY, Ada, O.

**The Insect-powder Distributor**  
or Dry-powder Sprayer for 1897.  
Pat'd in the U. S. and Can.

A perfect-working machine for applying dry poison upon vines, currants, cotton, tobacco, potatoes, fruit-trees, etc.

Manufactured by  
**Hotchkiss Bros., Wallingford, Ct.**

**FOR SALE.**—Barnes foot-power saw. Perfect in every particular. Have made over 800 hives with it. Five saws; every thing in order; all good as new; all out of bee business—no use for it. First draft for \$20.00 takes it, F. O. B.

E. D. KEENEY, Arcade, N. Y.

# Advanced Bee Culture.

During the earlier years of its publication, the *Bee-Keepers' Review* was devoted to the discussion of special topics. Each number was really a little pamphlet containing the views of the best men upon some special topic. After publishing the *Review* five years, its editor wrote "Advanced Bee Culture," a book of nearly 100 large, double column, well-illustrated pages, which is really a summing-up—the cream, so to speak—of those first five volumes of the *Review*. It begins with the opening of the year, and takes the reader through the whole season, describing the most advanced methods for performing all of the most important operations until the honey is sold and the bees ready for winter. A single idea in the book may be worth dollars to the reader. The price of the book is 50 cts., but, for advertising purposes, for the sake of getting the *Review* into new hands, this book is given absolutely free to any one not now a subscriber who sends \$1.00 for the *Review* for 1897.

W. Z. HUTCHINSON, Flint, Mich.

## The Danzenbaker Hive

and Honey won Highest Honors at the Fairs, and Pays as Premiums to Purchasers

- of 50 hives, \$50 for the best 100 Danzenbaker sections.
- of 25 hives, \$25 for the best 50 Danzenbaker sections.
- of 10 hives, \$10 for the best 20 Danzenbaker sections.
- of 5 hives, \$5 for the best 10 Danzenbaker sections.

Further particulars regarding these premiums, also special catalog of the Danzenbaker hive and system, furnished free upon application.

APR. 1, 1897.

No. 7

STRAY STRAWS  
FROM DR. C. C. MILLER.

G. C. GREINER, p. 192, thinks it would be better to unite two or three weak colonies and have better work in sections. Right. Now if we could only unite two or three poor seasons!

A. I. ROOT, p. 213, has "let up" on humbugs because he concludes he has done his part in warning the public. No, you haven't, A. I. Don't "let up" till you're "let down" into the ground.

WOODCHOPPER says, p. 194, that burr-combs between top-bars and super will make bees work sooner and better in sections. So they will if there's only foundation in the super, but I don't believe they will if there's a bait in the super.

A SPECIAL WAGON for bee-keepers is a desideratum. Why not have such a wagon on your price list, as well as a wheelbarrow? [Can. Send us your orders and we will give them our attention. In lots of 10 and 100 the price will be less.—ED.]

A SERIES of experiments which have been carried on under the direction of the Smithsonian Institution has developed the fact that the colored boys and girls in the Washington schools have naturally much better memories than the white children.—*Chicago Record*.

BROOD REARING is not repressed by R. McKnight at any time. He said at Ontario convention: "I just let them go on as long or as much as they please; and the more bees that go into winter quarters with me in a hive, I expect the more bees will come out in the spring, and I shall have so much more working force."

INQUIRIES have come lately as to whether bees are taxable. I know no reason why they should not be taxable like any other live stock; but as a matter of fact I think they are exempt in some States. Assessors don't always know the law, and it might be a good thing if those who know would report as to whether or

how bees are to be taxed, so a condensed statement might be made of all the States.

THIS WINTER, for the first time, I saw some genuine honey put up in a tumbler with a piece of comb in it. It came direct from the bee-keeper to the grocer. I wouldn't infringe on the adulterators' trade-mark in that way. [Yes, come to think of it I have seen such honey; but I agree with you that I would not adopt the adulterators' trade-mark.—ED.]

BEE-PARALYSIS amounts to something in a good many cases with Woodchopper—p. 194—which means, I suppose, that he lives in the South, for there it's a very serious matter. Last year, however, I had one case so bad—the only case I had—that I killed the colony, queen and all—the only colony I ever deliberately killed. [Woodchopper lives in Wisconsin.—ED.]

CRIMSON CLOVER.—Not encouraging are the words from the Experiment Station of Illinois. It reports: "Crimson clover is less likely than red clover to succeed in Illinois. Drouth and cold are its great enemies—notably drouth, especially in the early life of the plant. [Crimson clover around Medina is a great success. My eyes are now resting upon a beautiful field on the hill in front of the factory. Perhaps your experiment station in Illinois does not know how to grow it.—ED.]

A DIVIDER, as described on page 52 by S. T. Pettit, is before me, and I'm inclined to believe it may nicely accomplish what he claims for it—the sealing of the outside sections sooner than it is accomplished in the ordinary way. At any rate, it's easily tried. [Yes, I believe the idea is a good one, and should be tried this summer. The ordinary dovetailed supers have a follower and tightening-wedge. In place of these, but on each side of the sections, may be placed a perforated separator with bee-space cleats on one or both sides. This would carry out Pettit's idea.—ED.]

L. A. ASPINWALL, in *Review*, gives something that may prove to be a decided forward step in the matter of controlling fertilization. A day

or two after the virgin queen emerged he clipped  $\frac{1}{8}$  of an inch from *both* her wings, thus limiting the time and distance of her flight, lessening the chance of mating with drones at a distance. In two or three cases he clipped  $\frac{1}{2}$  of an inch with success. In some places this would be practical isolation and control. [This is quite a point, and it might be well for our queen-breeders to test it thoroughly.—Ed.]

"I ALWAYS LIKE to read footnotes to any article, and they catch my eye first, for they are generally the cream skimmed from the milk, and many a time these short notes contain in substance the sense of the entire article."—J. M. Young, in *A. B. J.* [From a private letter from Dr. Miller I am rather of the opinion that he makes this quotation as a gentle reminder. We have had so much good matter lately, awaiting space in the journal, that I reduced the length and number of the footnotes temporarily; but if that is not the wish of our readers I will start them in full blast again.—Ed.]

MIXED. On p. 164 the editor quotes a passage from Stilson, and then says it was Whitcomb. In *Review*, p. 35, R. L. Taylor makes a slip, and attributes Cheshire's views on foul-brood spores in honey to Cowan. Or am I badly mixed myself? Say, Ernest, you and Taylor better have that fish feast, and be sure to invite me. [I am glad you caught Taylor. He is a man who is not apt to make a slip, so I feel that I am in good company. I discovered my mistake too late, and wrote to Stilson, explaining that I would call attention to the matter in our journal. This mention will set the matter right.—Ed.]

EXPERIMENTER TAYLOR reports in *Review*, that from a colony badly diseased with foul brood he took outside combs of honey and fed to a colony busy rearing brood, without infecting it. A queen from a rotten colony failed to give the disease to a healthy one. He concludes that not all honey and not all queens will carry foul brood, and that perhaps germs are not carried about by the action of the air nor upon the bodies of the bees. [I myself have also taken the queen from a foul-broody colony, and put it into a healthy one—yes, done it several times with different queens; but never has the disease been so communicated, and I somewhat question whether it is ever so carried.—Ed.]

"I AM MORE THAN EVER convinced that the secret of successful wintering is to pack warmly above frames, and that side packing between the walls of hives is unnecessary. With plenty of top packing and water-tight roofs, together with plenty of food in store, no one need fear the rigors of our winters." So says H. W. Brice in *B. B. J.*, and C. F. Muth preaches the same doctrine. [Such advice will do very well for mild climates, like that of England and the vi-

clinity of Cincinnati; but it will not do for climates even as cold as our own. We have tried exactly the winter packing above described, and found we did not get as good results as where there was packed space *all around* the brood-nest. A few years ago I tried some colonies in single-walled hives with large cushions on top; but some of them died, while those in regular chaff hives came through in good condition.—Ed.]

The *Canadian Bee Journal* has a report of the late Ontario convention, and it looks as if our cousins across the line had given up quarreling and had spent the time in profitable discussion. The report is good reading. [The Ontario association is in a flourishing condition. Besides a government grant, it is made up of a lot of enterprising, hard-working bee-keepers. The geographical distances in Canada are not nearly so great as in the United States; that is, I mean that our neighbor bee-keepers are not so scattered, and it is a very easy matter for them to get together and make a big rousing enthusiastic convention. The Ontario meetings are held from year to year at places within comparatively few miles, while the meetings of our equivalent association, the North American, necessarily have to be scattered at points a thousand or more miles apart. For instance, last year the North American met at Lincoln; this year it takes a big leap over to Buffalo—a distance of about 1100 miles. Very few of those present at Lincoln will be present at Buffalo, and the consequence is there is a "new crowd" at each meeting.]

AN ARTICLE by Dr. Bourgeois is being copied in the French bee-journals, explaining how bees hang suspended by means of suckers on their feet. Cheshire says there's nothing of the kind, but bees hang by hooks, except on a smooth surface, and then they stick by means of a clammy secretion, and they can't hang to the under side of glass if it's wet. A sucker would work all the better on *wet* glass. [Cheshire, although marvelously accurate in some things, made some errors. He may, perhaps, be right in stating that there is no suction-pad to the foot of a bee; but some authorities, I know, assert that there is such a device, and I have seen what looks like it in the microscope. When I was studying microscopy, some eighteen or nineteen years ago, I observed what has been termed a little sucker, or "pulvillus." While much more apparent in the foot of a fly, it appears, at least, to be present between the claws of the bee. Bees do not usually try to walk on glass; and in their efforts to fly through it they buzz up and down as though they could not stick; but after they are a little tired out I have seen them many times walk up the perpendicular surface of a piece of glass. How could they do it without a sucker?—Ed.]

By R. C. Atkin.

SECTIONS; WEIGHT, SIZE, SHAPE, ETC.

Oh! selfish man, unjust, untrue,  
 With longing eye and grasping mind,  
 Endeavors, by some hook or cue,  
 To beat his friend—yes, all mankind.  
 The largest eggs he'll keep at home:  
 The smaller ones most sell, says he;  
 And nature's realm he'll ever roam,  
 Excuse to find or conscience ease.  
 The sections thin, still thinner yet—  
 Fifteen, fourteen, twelve will do,  
 Still a pound is what we get.  
 With me 'tis so—no doubt with you.  
 O manhood! rise, be just, be true;  
 Your weights full measure always give;  
 Reward in kind awaiteth you,  
 If good or bad the life you live.

This discussion about the weight of sections is still agitating bee-keepers. It seems to me strange that so many are led astray. What does it all mean? Friends, just open your eyes and you will see that the gist of the whole matter is a question of honest or dishonest weights. There is a disposition to get more than our money's worth—an evil that permeates the whole mass of our people. We can scarcely find a paper that does not carry advertisements of one kind or another offering *free goods*. Oh the hundreds upon thousands of ways to make us believe we are to get *more* than our *money's worth*!

I have observed for the past three or four years the disposition to have sections of honey light weight. I have no doubt that many—yes, very many—of our apiarists have not seen the spirit that underlies the whole matter. Suppose two honey-dealers do business on the same street. A gets his honey from Dr. Miller and such men, who would not produce any thing but full-weight sections. He buys by the case. If the sections are full weight he gets 24 pounds, say for \$2.40. He will retail these sections at 15 cts. each, or two for a quarter. Mr. B buys a lot of light-weight sections, we will say at the same per case that A paid; but while A got 24 pounds of honey at 10 cts. per pound, B has paid just about 11 $\frac{3}{4}$  cts. per pound for 21 pounds, supposing the light weights to run 14 ounces. So long as each bought by the *case* and sold by the *piece*, B, having bought light weights, would make the greater profits because he had less freights to

pay; but B's customers got less for their money, and his producers got more for their honey.

Shrewd dealers (a vast amount of wickedness is covered by that word *shrewd*) soon catch on to these things, and the next step is to say to the producer, "These cases are short weight; we can not pay you by the case." I feel sure that the greater part of the fraternity do not really intend to do wrong; yet after all if we watch ourselves we shall find we are willing to take all we can get.

Supposing, however, that we are honest, we shall ask pay only for net weights. It is very easy, then, when the dealer can get 24 sections at light-weight prices, to retail at a profit by the piece—yes, a *big* profit. We must not forget that the commercial world is not governed by the golden rule in its business. I am very sorry to say that even those who profess to be governed by this rule, many of them, leave the rule outside of their *business* transactions.

I know that dealers have been advising light-weight sections. It seems to me the reason is to increase profits by buying by *weight* and selling by the *piece*—a sort of deception. I am afraid *we*, too, have been hoping to get full-weight prices for our light-weight goods.

One thing that has led bee-keepers, probably, to produce light weights is the fact that our sections have not been proportioned right. The 4 $\frac{1}{2}$ x4 $\frac{1}{2}$ x2 will hold a pound when well filled between separators. The 1 $\frac{3}{8}$  thick will hold a pound when full separators are used if plump, and attached at the bottoms. We find, however, that better work—nicer and better finished sections—can be had if a thinner section be used. I have no doubt that many bee-keepers have come to produce the light weights, not with intent to defraud, but to get a more fancy article. It is no easy matter to change the height or width of a section, but it is easy to use a thinner one. Whatever the causes that have led up to the thin or light-weight section, it is altogether wrong to sell 12 or 14 ounces of honey for a pound. The sections are supposed to be a pound. We call them *pound* sections in catalogs and everywhere. Customers will buy them for pounds. People get so used to being cheated that they expect to be, and many submit because they think they can not help themselves.

I have no argument to make against a thinner section, for I believe that the two-inch section is too thick to make a neat finish. 4 $\frac{1}{4}$ x4 $\frac{1}{4}$ x2 is too much of a chunk, and the more so in appearance as commonly made with the gross width of sides extending part way along the top and bottom bars. A section whose sides are one width, and top and bottom narrower their extreme length, is nicer looking, and will be better finished. This I observed years ago, when I changed from nailed sections to the one-piece.

There is one thing that makes it hard to do justice and sell by the section or case; and that is the fact that we can not govern the seasons—the flows—for we are sure to have lighter-weight sections in a poor season than in a good one, and this with the very same sizes and fixtures. This can be remedied somewhat by the apiarist understanding his business, and so managing by skill and improved fixtures and methods that the results in work will be more nearly equal. Our present hive system—or whatever you may call it—is about like trying to build a house a little at a time, and during a term of ten or fifteen years, and all the time trying to obtain the greatest amount of comfort, economy, and profit. When the structure is done it is an expensive, ill-proportioned, incongruous mass. About the only way to get the best results is to tear down the whole thing and build anew; and in the new, profit by the experience of the past.

If we must stick to the present size of section in length and width, let us keep it thick enough to make an honest section. I want here to protest against the custom of speaking of the thickness of a section as its *width*. I know to speak of a section when its mechanical construction *alone* is involved, we might speak of the material as 17 inches long, 2 wide, and  $\frac{3}{8}$  thick; but when speaking of it in reference to its capacity it has length, width, and thickness; and since the length and width are the same and regular, the variations the other way should be *thickness*, not width, as many call it. Lumber two inches wide will make a section two inches thick.

I have indulged in a few figures to find out the capacity of various sizes of sections. At first I calculated by outside measure; but I remembered that, the further we get from the cube or square, the more wood in the section walls. A  $4\frac{1}{4} \times 4\frac{1}{4}$  section in the flat is 17 inches long; and if one inch thick it contains, inside measure, 16 inches of *space*. A section  $2\frac{1}{4} \times 8\frac{1}{4} \times 1$  would contain 16 inches of space, but in the flat would be 21 inches long. This shows that the true way to count for *capacity* is *inside* measure.

Here is a table comparing two sizes and various thicknesses.

$4\frac{1}{4} \times 4\frac{1}{4} \times 2$ .....	32 cubic inches.
$4\frac{1}{4} \times 4\frac{1}{4} \times 1\frac{1}{2}$ .....	30 cubic inches.
$4\frac{1}{4} \times 4\frac{1}{4} \times 1\frac{3}{4}$ .....	28 cubic inches.
$3\frac{3}{4} \times 5 \times 2$ .....	$34\frac{7}{16}$ cubic inches.
$3\frac{3}{4} \times 5 \times 1\frac{1}{2}$ .....	$32\frac{1}{16}$ cubic inches.
$3\frac{3}{4} \times 5 \times 1\frac{3}{4}$ .....	$30\frac{1}{16}$ cubic inches.
$3\frac{3}{4} \times 5 \times 1\frac{1}{4}$ .....	$27\frac{3}{8}$ cubic inches.

A  $4\frac{1}{4} \times 4\frac{1}{4} \times 1\frac{1}{2}$  section, used between separators, and with bottom starters, and *well built down* to bottoms, will hold an honest pound. A  $3\frac{3}{4} \times 5 \times 1\frac{1}{4}$  has just a trifle more capacity in cubic inches of space, and will, I believe, hold a little more honey. When we used the nailed sections with top and bottom bars same width

clear through, we got a better finish to both top and bottom. All these years I have wondered why we could not have our sections that way, but supposed that in making the one-piece section there was some trouble in the cutting that required the width of the sides to continue on to the ends.

Mr. Editor, can you not make a one-piece section with these features—i. e., tops and bottoms the same width throughout their length, and sides ditto, just like the four-piece section? I favor such sections, and  $4\frac{1}{2} \times 1\frac{1}{4}$ , used with full separators. The top and bottom bars should be a trifle wider than the thickness of the finished comb, not more, if we want corners nicely filled.

Loveland, Colo.

[We can and have been making just such one-piece sections as you describe in your last paragraph. But as there has been so little demand for them we have discontinued listing them. The open-corner Danzenbaker section, but  $\frac{1}{4}$  inches square, would, I think, meet your approval—see No. 7 of our catalog, p. 12.]

Regarding light weights, I can't see the matter just exactly as you do. The average consumer does not know how much a section of honey weighs. He only thinks of it as a chunk of honey costing so much. I think you will find that the so-called light weights sell for less money at retail per piece than the full pounds. The tendency nowadays is toward smaller prices, and in honey it must mean smaller or thinner combs; and in regard to these latter we must not forget they are of about the thickness of the average *store* combs in nature; that honey ripens more quickly and better in thin rather than in thick combs. There are arguments for thin combs outside of any supposed greed on the part of the dealer.—Ed.]

## SHIPPING HONEY.

THE CARELESSNESS OF FREIGHT-HANDLERS.

By C. Theilman.

In GLEANINGS, page 9, we find a very valuable article on packing and shipping comb honey, by C. F. Muth. It should be read and re-read by every producer and shipper for the benefit of both. I can agree with Mr. Muth on nearly every point set forth, but would add one more of the most important points on the transportation side.

There are probably but few shippers and receivers of honey who have had actual experience on the cars where honey and other goods and stock are shipped, as I have had, riding with such goods on the same train. Considering the way some of these cars are flung around in switching on the different stations *en route*, behind the engines, and sometimes sent a flying on a down grade with such a blow against the rest of the train as brings the stock on their knees, it makes you think there was a collision. It is a wonder that any whole section of honey is left on arrival at destination. No matter how well it may be put up and packed, espe-

cially if the weather is cold. There is surely more comb honey broken or damaged by the train men in this way than by any thing else in transit. Even the large outer crates are no sure guard against this collision-like stroke which I have witnessed at Chicago on honey packed in large crates sent from the Home of the Honey-bee, some of which was badly broken when we opened the crates. This mismanagement of the train men can not be too strongly impressed on the manager and general freight agents of the several roads.

I must say a good word for the men at stations on the C., M. & St. Paul R. R. All the comb honey I have shipped on this road, probably 200,000 lbs., arrived in good condition (without outer crates), only one crate being reported broken. I have watched their hands at depots, and without exception they handled honey as carefully as I would, without their knowing that they were watched. They are educated to it. On most other roads it is difficult to ship honey and receive it in good and sound condition at destination points.

I can not agree with Mr. Muth when he says, "Unless there is a collision, or cases are upset or flung about, combs hardly ever break while in transit, and they do not break if hauled in a wagon over a rough pavement." This, of course, depends very much on the kind of pavement and wagon used. One without springs, or the heavy trucks used by draymen, are surely not fit to haul comb honey on. Some will get damaged, or more broken than it already is.

The pavements in Cincinnati must be in much better condition now than when I saw them in 1854-5, and in far better condition than those in Chicago, or other large cities at present, for considerable honey is broken down by unsuitable wagons on those rough pavements. Comb honey should be hauled only on light spring wagons, especially on rough roads or in cold weather.

Theilmanton, Minn.;

[This is quite an important matter. It would be well for our subscribers to give us the names of those railroad companies who make it a point to see that their men handle their freight with reasonable care, and also those companies which smash up honey. The employees are not so much to blame as their companies. We know that there is a great difference in roads, and, other things being equal, patronize those which don't smash. Let's have the names of the companies.—Ed.]

#### LATE-REARED QUEENS SUPERIOR, AND WHY.

By Geo. L. Vinal.

Mr. Editor:—I noticed in Dr. Miller's *Stray Straws*, Jan. 15, page 41, that he says, "Herr Guenther, late-reared queens are the best," etc. Now, I have kept bees about 25 years, but not to study the subject much for more than about

10 years, and I found that out. Page 530, July 15, 1896, *GLEANINGS*.

Not to tell what my grandmother knew, but she often used to say to me, when a boy, "A swarm of bees that comes off in buckwheat time, the swarm that is left will do better the next spring than any of the others." Her knowledge was from observation. She used the box hives as almost every one did then, forty years ago, and it was partly her observation that led me to experiment on late-reared queens; and I have frequently noticed that, whenever I have purchased queens late in the fall, from either you, Alley, Lockhart—in fact, from almost any reliable queen-breeder—they invariably proved better, longer-lived, more prolific, and gave a larger and stronger bee, than one purchased in the early part of the season. I do not guess at this, or *think* it is so, for I keep a record of every hive, of every pound of honey that comes from each hive, of every swarm, when the queen was introduced, whom purchased from, how many new combs each colony builds, and have for a number of years; and as I look back over my records I am convinced more and more every year that for me, at least, late-reared queens are the most profitable, and why?

1. I find them larger, as a rule.
2. They do not seem to want to swarm so much, at least the first season.
3. They build up quicker in the spring, all things being equal.
4. The bees seem more hardy, and are better workers.
5. When they swarm it is generally a rousing big one.
6. With me they winter better.

We have had quite a spell of warm weather here; and in looking over the bees I find that, in eight hives, the bees that are the most quiet are some whose queens were hatched from the 5th to 18th of October. The eight hives I speak of I destroyed the queens. They were from two to three years old in October, being some I raised myself. I did it to try the experiment. I think the experiment is worth trying. One of the best queens I have is one that I got from you. I wrote to you about her, and you wrote me that some one in North Carolina, I think, raised her. You sent him my letter, and I afterward got a letter from him, stating the queen that I had was raised late in the fall, and he would like some of her daughters; but it was then November, and I had none to dispose of.

I wish some of the expert queen-breeders would make observations; but perhaps it would hurt the queen-business in the early part of the season.

Charlton City, Mass.

[A good many reports have come in, showing that late-reared queens seem to be better. I

can hardly see *how* they can be better than those reared in spring or summer, under *proper conditions*.—ED.]

### HONEY VINEGAR.

NOT SUITABLE FOR PICKLES; HOW TO MAKE HONEY LEMONADE.

By C. Davenport.

My experience in making honey vinegar may be of interest to some of the readers of GLEANINGS who are thinking of making some of it the coming season. A few years ago I tried making it on quite an extensive scale in a number of barrels which were set up from the ground in an open shed facing the south. The heads of the barrels were removed, and they were kept covered with light cloth in order to exclude dirt and insects, but still admit plenty of air, which I found to be a very important factor. I had no difficulty in making strong vinegar, the strength depending, of course, upon the amount of honey used. Clover and basswood honey made vinegar of fine flavor; but that made from dark and inferior honey had a somewhat bitter taste, and I doubt whether there would ever be much demand for that made from such alone; and there is seemingly an objection to that made from clover or basswood honey; for, while the flavor and strength are all that could be desired, it seems to cut up or soften pickles that are made with it. I noticed this at our own place; and a good many to whom it was sold complained of the same thing. Most of the vinegars of commerce, instead of cutting or making pickles soft, harden them. Of course, that made from honey is all right to use on lettuce, salads, or pickles that are to be used soon; and if the defect in it which I have mentioned could be remedied, there could be a large amount of honey very profitably used in this way; as I found that 1½ lbs. would make a gallon of very strong vinegar, and it can be made in large quantities without much work or outlay. Here we have to pay from 20 to 35 cts. per gallon for vinegar, and the cheaper grades are not fit to use.

There is much more vinegar used than any one who has not inquired into the matter would believe. Possibly a small amount of some kind of drug or acid could be put into honey vinegar, which would overcome its tendency to soften pickles.

There is another way some honey can be very profitably used by bee-keepers, and that is by converting it into honey lemonade, as occasion may offer. Ever since I read that article in GLEANINGS, by John C. Wallenmeyer, in which he spoke about honey lemonade, I have had a desire to test the matter; and as the people of our town celebrated the Fourth of July last year, I resolved to give the matter a trial that day. I was not able to leave home myself, but I got two young men in the neighborhood inter-

ested in the matter, and they were eager to try it on shares. We took a low wagon with a big hay-rack on it, and fitted a canvas top over it and to one side. The other side was left open except for a strip of canvas at the top, on which was printed in large letters of red and blue—

"PURE HONEY LEMONADE."

I furnished a number of newly built combs in brood-frames to hang up on the back side of the rack. Quite a display was also made of section honey, and extracted in glass of different sizes; a frame of bees with a queen, in an observatory hive, and two boxes with wire cloth on both sides, containing bees, were also used to attract attention. The whole was decorated with evergreens, flags, and flowers. I furnished a steady team so the boys could haul the "rig" around where the people were the thickest.

Before and after the Fourth we had some very hot weather; but the glorious Fourth was a cool, cloudy, even chilly day, compared with the weather just before; and on this account our sales were not what they would have been on a warm day. Many of the other lemonade-stands did not pay expenses; but the boys gave me \$13.45 as my share of the profits on the sale of lemonade. The whole time the three of us spent in arranging the wagon was not over half a day. The lemonade was made just the same as any, except pure extracted clover honey was used to sweeten it, instead of sugar. While I do not know that many would like its taste any better than that sweetened with sugar, it is certainly much more refreshing, and has a pleasant or stimulating effect. We used a large amount of it at our place last summer; and many of the neighbors who drank some, bought honey to make it.

In selling honey lemonade at a public stand, those who buy it seem to notice its refreshing effect, and return for more. I believe it is a very healthful drink, and I am going to see if it will keep when bottled up air-tight. If it will I intend to put some of it on sale this summer among druggists and grocers.

Southern Minnesota.

[Friend Wallenmeyer says all honey, as a sweetener, is not as good as sugar and honey; but, besides what Mr. D. says, quite a number have testified that lemonade where honey only is used as a sweetener is first class. There might be, of course, a difference in tastes.—ED.]

### BEE-CELLAR AND HIVE CARRIER.

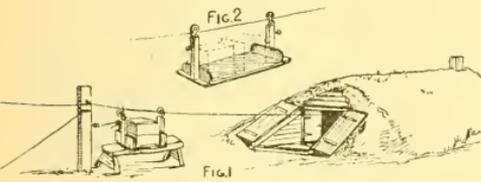

By N. Young.

As there were some inquiries made about a year ago about cheap bee-cellars or caves I herewith send you an illustration of a cheap one I built, and a very good one, I think, or at least it looks as though it would last for many years. It is made as follows:

I first dug out a place 6 feet deep, 8 wide, 16

long; then I made the framework of old railroad ties by setting one in each corner of the cellar and two on each side, about in the center, letting them all into the ground about six inches at the bottom. I then laid ties lengthwise on top of the posts and spiked them on them. Next, ties were laid crosswise close together, forming the roof. As the ties are 8 feet long, the top is 2 feet higher than the surface of the ground. This space was sided up with ties except at front end. The illustration will show about how it is finished. All is then covered with dirt, except the doorway. Those ties were not much decayed. They were taken from bridges where the railroad company was putting in new work. I wintered a part of my bees in this cave last winter quite successfully, and have about 70 colonies in it this winter. The remainder, 120, are under my dwelling-house in the cellar.

Now I will tell you how I put my bees down cellar by the help of the wire hive-carrier. See description in GLEANINGS, page 425, 1896; also illustrated here, showing front of cave, but somewhat changed and much improved.

First get a post about 8 feet long. Set it about 10 or 12 feet from the first steps of cellarway. Now drive a stake about 12 or 15 feet further back, which we will call the anchor stake. Then put on wire or cable chain to hold the main post in place. Now you must provide some way to fasten the end of the wire to the farther side of the cellar wall below. This I did by setting a post in the bottom of the cellar and nailing it to a joist overhead, and in range with the center of the doorway and post above. Then I put one end of the wire around the post in the cellar about half way up, and about 6 feet high on the post above on the outside, stretching it tight with a wire-stretcher. The stretcher should remain in place to tighten up when the wire becomes a little slack.

The hive carrier I made for this work is made as follows: I first got a board 5 feet long and 14 inches wide; then two pieces of 2x4 scantling, 10 inches long; set one at each end of the board on top; nailed them fast; then next a board 6 inches wide and 14 long nailed to inside of post and to bottom-board. Next put on the barn-door pulleys; hang one end on wire as you see in illustration; hook the other end to the post by means of a wire hook—see illustration—and

at the same time the one end is resting on a bench about knee-high. This opens it up nicely to receive the hive; then set on the hive at the forward end; raise the hind end; place pulley on wire; unhook from post; then all you have to do is to walk behind and hold back; and when you get down where you want to stop, let one end down on a box, or something convenient, and then take off the hive.

This contrivance has worked first rate with me; and as I have to handle my bees all alone I think it a big help. I expect to take them out of the cellar in the spring in the same way. It will save all that lugging up the steps.

Ackley, Iowa.

### VALUE OF DRAWN COMBS.

WILL THE BEES GNAW DOWN THE NEW DRAWN FOUNDATION?

By Wm. Staubaugh.

As soon as honey comes in I give from one to two L. supers filled with as much drawn comb as will reach around; that is, I fill up a super partly filled with drawn comb and foundation. As bees do not gnaw down drawn comb for me, I put on supers with sections before much honey is coming in; and to give plenty of sections *in time*, is preventing a good deal of swarming. As soon as a super of sections is partly filled I lift it up and put an empty one in and the partly filled on top. If the bees seem to be crowded I give them from two to four supers of sections to prevent them from swarming all I can.

But perhaps you ask, "How at the end of the honey season, with so many unfinished sections?" Giving the bees all the room they can possibly occupy, if the honey season is not an extra one, will result in a great many unfinished sections, and also a great many drawn combs not filled with honey. Will the drawn comb balance the unfinished sections? Yes, more than double, for me. I sort out all sections less than two-thirds filled, and keep them for bait sections. I do not want to put on a single super of sections without one or two bait sections. These bait sections, in a poor season, will sometimes be filled when the other sections are left untouched. If I have drawn comb to fill my supers, say half of the sections or more with drawn comb, it is no trouble for bees to occupy sections at once. But how much more so, if The A. I. Root Co. could furnish us with drawn comb for all the sections in the supers!

How about my sections that are filled more than two-thirds? Well, I put my honey in sections into three grades. The sections two-thirds filled I sell in my home market here for 10 cents; the sections more than two-thirds filled I sell at 12½ cents. These partly filled sections sell here

in my home market as readily as do the full ones.

If we turn to the honey column for Feb. 1, the fancy whites are only from 11 to 14 cents; so I think I am doing well in my home market by selling my unfinished sections from 10 to 12½ cents. My full sections I sell at 15 cents per section without regard to color or kind of honey.

As soon as you can give us drawn comb, then we can do away with giving the bees so many more sections that they finish just in order to get a big lot of drawn comb by the bees for the year to come.

But how about your drawn comb in the gnawing-down process? The comb drawn out by the bees is never gnawed down by the bees, though not a drop of honey is coming in, while they will tear down foundation that is not drawn out. If you can give bee-keepers drawn comb, both for sections and brood-chamber, I think it would add tons of honey to the bee-keeping fraternity.

Egton, W. Va., Feb. 13.

[The drawn comb referred to in the foregoing article is that which had been previously drawn out from foundation. In answer to the last question, would say that so far the bees have not gnawed down the new drawn or deep-cell flat-bottom foundation. See result of an experiment in the month of March, reported in the editorial columns.—Ed.]

### DEEP SPACE UNDER THE FRAMES.

THE IMPORTANCE OF A WARM BROOD-NEST FOR COMB HONEY.

By F. Danzenbaker.

Mr. Editor:—As you refer to my advocacy of a deep space under brood-frames, in your footnote after Mr. S. T. Pettit's valuable article on page 51, I wish to say that heat and ventilation are two prime factors in the production of fancy comb honey, of vital importance. He says, "Bees generally commence at or near the center of the super." They *always* cluster together and begin in the center of the cluster. If the swarm is small and hive large, they will cluster in the warmest end or even in a corner, that the walls of the hive may help to retain the heat on two sides while they form a living wall of bees on the open side. They must generate and maintain 80 to 105 degrees of heat continuously, even if it takes nine-tenths of the bees to do it, and they need no more. In warm weather three or four colonies may be hived in a barrel, and fill it; but half a peck of bees may be hived in a half-peck, if carefully wrapped up to help retain the bee-heat, and they will fill it too. But if half peck of bees are put in a large hive they must cluster in a corner of it, and have but few bees to spare for gathering; and the little they collect is stored within the cluster, to ripen. If a gallon of raw nectar were placed in the bottom of the hive they *will not* take up into the cells

more than they can cluster on to ripen, any more than a horse will drink water when it doesn't need it. Two hives may be standing side by side when there is plenty of honey to be had. One may be rushing, and the other doing nothing. The one has the heat to cure the honey, the other has not, and the thermometer will prove it every time. The idle colony is doing the *best thing possible* in staying in, to hatch the bees needed to get the heat up to the working pitch, which may be in a week, and they are rushing too.

Many times I have found colonies with empty comb, only a few cells of uncapped honey stored right around the brood, with the queen cramped to laying several eggs in each cell. Such a colony can be set to work at once by supplying with young bees until the required heat is supplied. The super is only so much more hive space; it is of no use to a colony of bees until they have bees enough to maintain a working heat in it; but it is a drawback if it is taking heat from the colony. Bees may be working vigorously in one set of sections, and when given another will almost stop and be accused of pouting, when they are doing the only sensible thing by clustering at home until they have the bees to keep up the heat to the ripening-pitch, not for a few hours in the middle of the day, but for all the time, day and night alike. A super that gets so cool at night that the bees can not stay in it, or so hot from 10 to 3 o'clock in the day that they are obliged to leave it or suffocate, will not do—thus losing half the day and two-thirds of the night. Bees make honey by brooding on it, and they can not succeed unless they are there all the time, any more than a hen can hatch chickens and leave the nest half the time. The fact that bees do *invariably* begin in the super *directly* over the center of the brood-nest, and finish the honey there first, and best where the heat is sure and steady, is proof enough, and they are sure of the sides for the opposite reason. A good cook can brown cakes with enough heat; but with too little they will have a scared-to-death look; and the cook caring for reputation will wait until the heat is right, that the food may be fit to eat.

Bees gather honey to feed young bees; and unless there is heat enough in the super to ripen it there it will sour; so they store it in the brood-nest until they have it solid on all sides and over the brood at the top of the deep brood-frames. When Mr. Pettit says, "Bees pass slowly and reluctantly over well filled combs or capped honey in search of store room," and they will not at all—in fact, can not—until the super is warm, he gives half the remedy when he says, "Give an entrance 1½ inches by the width of the hive," by supplying lots of air, as it comforts the bees and retards swarming." This enables them to stay in the super

all day. Now, if he will wrap up the super in such a way that a uniform even temperature is maintained at 80 or 105°, all right; he will find the sides and corner sections filled too, and nearly all at the same time. The super will not get too warm, if shaded from the sun, with  $\frac{3}{8}$ -inch air-space under the frames. I have used 1 $\frac{1}{2}$  inches, and it is far better than  $\frac{1}{4}$  inch to get the bees in the super. When crowded they will cluster on the outside for air. If they were set up on four bricks it would make the super the warmest part of the hive, and then the honey would go there sure. Of two extremes, no bottom at all is better than the regular  $\frac{3}{8}$  inch and deep frames for comb honey. My new hive embraces these features with others.

Washington, D. C.

[Here is another article that emphasizes the same point.—ED.]

### KEEPING SUPERS WARM.

#### THE USE OF PACKING.

By *Adrian Getaz.*

In reading over my last contribution to GLEANINGS I find that two points need further explanation. The first one is concerning the necessity of having the first supers given in the spring warm enough to permit the bees to work therein freely, not only during the day but also during the night. It is, perhaps, not generally understood that during the day most of the bees are in the field gathering honey. This is deposited in the nearest cells, and only a part of it carried to the supers. During the night a great part of the field-bees (if not all of them) help build the comb and transfer the honey from the brood-nest "up stairs," evaporating it to some extent at the same time.

It is evident that, if the supers are not warm enough, the night work will be curtailed, and the honey will remain in the brood nest instead of being stored up in the surplus apartments. This is why our leading bee-keepers insist that the supers should not be given too soon, and not more at a time than the bees can well fill.

□ Much has been said upon the necessity of keeping the brood-nest warm in the spring, but not much about keeping the supers warm enough, at least during the fore part of the honey-flow. Here in East Tennessee, on account of our elevation above the level of the sea, the nights are cool through most of the summer, and the above consideration is very important. I suppose the same is true of all elevated countries, the whole of the Alleghenies, part of California, and some of the Western States.

As to the best way, "I don't know." I use to a great extent double-walled chaff supers and covers (the brood-nests are also double-walled).

The objections to them are the cost and the weight. Outer cases can be used advantageously with temporary packing. For that kind of packing I prefer rags to any thing else, as they can be put in and taken out easily without making a muss like chaff or shavings.

With sufficient protection, so as to retain the heat of the colony fully, more room can be given in the supers; and this will in a measure take the place of drawn comb, for it is evident that, when only foundation is given, what little honey can be put in each cell will make a considerable amount if enough cells are there. And if the warmth is there, but little time will be required to draw the foundation out. It has often been stated that the bees failed to draw thick foundation out sufficiently. I suspect that the lack of sufficient warmth has very often, if not always, been the cause of it.

#### EXCESS OF NURSE BEES AND LARVAL FOOD THE CAUSE OF THE CONSTRUCTION OF QUEEN CELLS.

I said in my last contribution that an excess of larval food was the cause of construction of queen-cells. It may be remarked here that the queen-cells (barring the case of loss of the queen) are constructed only when three conditions are present.

1. Nectar and pollen coming from the field.
2. Numerous young bees, or, what is the same, nurse-bees, producing larval food.
3. An insufficient quantity of brood to feed, due either to lack of comb for the queen to lay in or to a failure in her laying powers, or, I think very often, both together.

If either of these conditions is lacking, no queen-cell will be constructed; and even those started may be destroyed when one of these conditions happens to disappear completely. I will give a few examples.

If you destroy the queen-cells of a colony ready to swarm, and divide that colony in two, completing both hives with empty combs, the probability is that both will construct queen-cells again, and, of course, swarm. In fact, it will happen in the majority of cases. Now, if it was merely a question of space, why should they do so? But the fact is, the discrepancy between the number of nurses and the amount of brood to feed still exists in both hives, hence the construction of queen-cells.

But if in a few days you cut out these cells, a second set will never be started (unless one of the queens happens to fail and is about to be superseded). Why? Because by that time there is the brood of two queens to be fed, while only the young bees of one are there to do the work.

Very often people have tried to prevent swarming by taking away a comb of brood occasionally. The process has been sometimes successful, and often unsuccessful. If the comb subtracted was of eggs and young brood, the remedy was worse than the disease; for it left

the nurse-bees still in excess. The comb taken away should be of sealed brood, so as to diminish the number of nurses, and increase the room for the queen to lay in.

Dr. Miller tried to prevent, not swarming, but increase, by the following process: In the place of the colony that just swarmed, put an empty hive with one or two combs of brood; then the supers of the old colony on the top, then the old colony itself on the top of the supers, shaking the majority of the young bees in front of the new hive below. He says that the old colony will give up swarming entirely, and destroy all the queen-cells—at least, they did the first year he tried the process; but the second year he was not always successful.

Well, the old colony on the top was then without enough young bees to feed the brood, and that is why they gave up constructing queen-cells. Probably there were not enough bees left to protect the cells against the attacks of the old queen, and she succeeded in destroying them.

"I don't know," but I am pretty nearly sure that, if Dr. M. did not succeed as well the second year, it is because he was careless and did not shake off the young bees from the combs as carefully as he did at first, and therefore too many were taken "upstairs" with the old brood-nest.

Again, Dr. M. tells us that he tried to prevent swarming by giving a young laying queen in place of an old one, destroying whatever queen-cells might be there, but without success. Now, why is it so, while, if you take the old queen away, and let the colony raise another queen of her own, no swarming will take place with her? I see but one explanation. In exchanging queens the conditions are not changed, or, at least, but little, and that on account of the superior laying power of the young queen. But in allowing the colony to requeen with one of her own cells (the apiarist destroying the others), the bees are necessarily without brood to feed at all—at least, during a few days before the young queen begins to lay. I think that, during these few days, quite a number of the young bees take to the field work and give up the nursing business; so when the young queen begins to lay, the number of nurses is considerably reduced; and this, coupled with her superior laying powers, puts an end to the discrepancy between nurses and brood—provided, of course, there is sufficient room to lay.

With sufficient room and a good queen I have often prevented swarming by taking away a comb of sealed brood before the number of nurses was too large, and a second comb a week later, perhaps a third one at most. This is a very good way if a moderate increase is wanted, without giving up a honey crop.

Knoxville, Tenn.

## RESULTS OF FEEDING BEES FROM EARLY SPRING TO BASSWOOD BLOOM.

FEEDING A LA BOARDMAN NOT PROFITABLE.

*By F. A. Salisbury.*

Wanting to secure a large crop of honey in the year 1896 we concluded to try the Boardman plan of feeding, and began feeding May 1, continuing till about June 25th, feeding about 1 lb. of syrup per day to each of 58 colonies. Syrup was made in the extractor by the process given in The A. I. Root Co.'s catalog; the same amount of sugar and water by measure or weight; it does not make any difference in this regard, as sugar and water, bulk for bulk, weigh nearly the same. After syrup was made it took about 30 minutes to fill all the feeders. This is made possible by having bees in the house-apary with feeders made in the bottom-boards. There is no coming in contact with bees, and no occasion to use a smoker. The next morning, when about to feed, a glance along the shelves would show which feeders needed replenishing, the feeders being 1-lb. Muth honey-jars. Some colonies would empty the feeders in two or three hours. As we said before, we kept this feeding up nearly two months, feeding during that time over 4 barrels of sugar. Cost of sugar about \$95.

A short distance from us is an apiary of about 100 colonies. These bees were not fed during this time. Ours were fed daily. One would expect to see our 58 colonies increase in strength, and swarm early; but the truth is, ours were later in swarming, and weaker in bees, by the time basswood opened. Now, I do not know why ours should be so backward, seeing they had over four barrels of sugar fed them, unless we fed so fast that all the available room in the brood-chamber was filled with syrup which prevented them from breeding. Last year, when reading friend Elwood's results of his feeding, I said he was wrong; but now I agree with him that it does not pay to feed bees. Our crop of honey was about two-thirds of the average of others near here; and with the cost of sugar and work taken out it left us about even. I shall feed no more sugar to stimulate. The only time I see that sugar feeding can be made profitable is in the fall when stocks are short of stores, when enough should be fed to carry them through till honey comes again.

Possibly if we had fed all the four barrels of sugar during the week just before basswood opened we should have had a different showing; but I do not think enough more honey would have been gathered to pay for the sugar and cost of feeding.

There is one thing I have noticed in making syrup by the cold-water extractor process; and that is, it does not granulate either in or out of the comb. We have about 10 lbs. of syrup made last June that has stood in the house-apary from that time till now. Of course, during the

summer it evaporated down to a thick syrup, and now is clear as crystal, and thick, with no granulation. Syrup made by boiling will granulate more or less.

Syracuse, N. Y., Feb. 9.

[Two years ago when I visited Boardman he was the only one around who secured any honey, and he attributed it to the fact that he fed them up to the honey-flow, filling the brood combs, so that the first and all the honey had to go into the supers. This seemed to be a big thing, and I can't quite give up that it is yet. However, one of our neighbors, M. G. Chase, of Whittlesey, O., has tried the plan and succeeded no better than you; at all events, he thinks he can't afford to do it again.

Let's have more reports from those who tried the plan, for many did try it. If nearly all made it a failure then we must give up.

Regarding the cold process of making syrup, Mr. Salisbury is the man who gave us the plan. This is surely a success. Our bees have had this syrup for two winters, and they never wintered better. To go back to the old mussy way would be like going back to box hives. A Mr. Laing, of Ontario, who visited us recently, said this idea alone was worth to him several years of GLEANINGS.—ED.]

#### CHIPS FROM WOODCHOPPER.

BEEES GATHERING POLLEN IN THE MORNING,  
AND WHY: A VALUABLE ARTICLE.

R. C. Aiken says bees gather more pollen in the morning than later, and wonders why. Well, they do, and then again they don't. It depends upon the kind of things they are getting it from. Some plants yield a somewhat sticky pollen which they can pack all day; and unless the supply is exhausted before night they will bring it all day; but corn, ragweed, and plants of that class, yield a very dry powdery pollen which can not be collected at any other time of the day than early morning, so they simply take advantage of the best time to pack it, which they can't do after the sun has been shining a few hours, while they will bring nearly all kinds of tree pollen until dark, if the weather lets them work so late, unless the supply is exhausted sooner.

CAUSE OF FOUNDATION BEING ATTACHED TO  
SEPARATOR, OR GETTING OUT OF PLUMB.

It is caused by the weight of the bees more than any thing else. If the bees come up and fill the whole super *en masse* at once, there will be no trouble; but if, as is generally the case, they begin in a cluster in the middle, and enlarge the cluster as they get more in earnest, the outside bees in the cluster will, by taking hold of the lower edge of the foundation, and hanging to it while other bees hang to them and to the separator next nearest to the center of the cluster, and other bees working at the foundation, mostly from inside nearest to the center of the cluster, it will slowly swing out of plumb; and as they draw it out it becomes permanent, and the result is a defective section. The same

thing and the same reason hold good in full sheets of foundation in the brood-chamber, unless the frames are wired, and I get rid of the trouble by turning the frame around, when it will soon draw back and nearly always become self-supporting before it gets too far back the other way. But I like Dr. Miller's plan of bottom starters much better than putting on a few sections at a time, as Manum does. It's less work, and makes a better job of filling down to the bottom every time, and so it ships better, and the sections weigh a little more. And, Dr. M., if you will use medium brood for the bottom starter, and make them only two rows of cells wide, you won't be troubled with their tipping over as they do if made from thin foundation, and the bees work them just as well. But, Dr. M., aren't you drawing on your imagination when you talk about a hive being two inches out of plumb? If one of my hives tipped over that much I should think it might be trying to roll over and crush me (but there would not be much danger of the crush unless they get heavier than they have for the last two years).

BEEES STOPPING TO FILL UP CRACKS BEFORE  
PUTTING HONEY IN.

It depends entirely on circumstances whether they do or don't. If they are up in the sections some days before they begin to work they will chink them up; but if the weather is hot, and the honey-flow good, they are just as apt to fill and seal them before doing any waxing at all, and they sometimes used to fill and cap entirely the large wooden boxes which I used to make before sections came in vogue. I frequently made the top out of two pieces, and they would shrink so that I could see down, and I saw them filled and capped, so that I could look right down between every sheet of honey after taking them off and getting the bees out, and not a particle anywhere; but if left on long after they were filled they would put in propolis; while if the weather was cool, and they wanted them warmer, they would fill them with white wax, the same as they used in making comb. But, doctor, it made me laugh just a little to see you cite Doolittle to a case of bees storing honey in extracting-combs with a crack  $12 \times \frac{1}{2}$  inch over their heads. Now, doctor, haven't you been around bees long enough to find that they never stop up a crack that they can go through freely? But may be your bees can't get through a half-inch hole—must be some dorsata about them.

SIZE OF SECTIONS AND LOW PRICES.

In answering a question as to the merits of a tall section over a square one, one writer makes a point which I think is a good one; viz., that it is a detriment to bee-keepers when they adopted the panel sections, and says the price of honey would not have been lowered if we had stuck to the large section, and he is right; and

another thing, besides the extra work of setting up, putting in foundation, scraping, etc., is that the bees will put up more honey in large sections than in small ones, just as they will beat themselves if allowed to work all together in a large hive, all in one body; but then, we don't want to raise chunk honey, so must have some kind of package to get it stored in. But I can get about 10 lbs. more honey in 2 than in 1 lb. sections, which would allow for a couple of cents less; but then, I can't sell them all at any price, except a limited number around home; they won't sell at all in Chicago unless there is a great scarcity. So much against my will. I am obliged to use the 4¼x4¼, and I prefer them 1¾ wide, and use without separators, and have but very few bulged or crooked combs; and if well filled they weigh nearer an even pound than any other size I ever had. Then I doubt whether as much honey is sold as there would be if the 2-lb. sections were all there were in use, for scores of people would buy just as quickly as any way, and, once bought, it would be eaten, and they would buy again just as quickly as if they had bought one pound.

#### LEAVING HONEY AT STORES TO SELL.

This, as T. S. Comstock says, would be all right if all grocers knew how or cared how they handle honey. I have seen just lots of honey just murdered by grocers and their clerks, by ignorance in removing sections from cases, or by taking hold of it with the whole hand, letting the fingers dent into the comb, and setting the honey to running out; and some of them will set a case on the counter, cover off, and let everybody who comes in stick a finger or knife or pencil in just to get a little taste; and it is surprising how many people will try that little taste; and it doesn't take much to spoil a case of fine honey. So if you can't find a careful man who understands handling honey you had better sell it before you leave it, or, you may be told when you come around again that the honey is in bad order, and won't sell; and when you see it you will believe he is telling the truth; but it will not be so easy to make him believe he is at fault in the matter. WOODCHOPPER.

[Woodchopper is an old correspondent who used to know how to hew pretty closely along the line, and it is evident he hasn't forgotten how to split off from his store of experience great chunks of truth or fact yet. Let the chips fly more and often, friend W., even if they do hit right and left. Why the bees gather pollen in the morning from some plants is very reasonably explained, and I doubt if even a few knew the reason. That other point, that bees don't always stop to chink up cracks before storing honey, is well taken. Bees do nothing invariably.—ED.]

*If you would like to have any of your friends see a specimen copy of Gleanings, make known the request on a postal, with the address or addresses, and we will, with pleasure, send them.*

#### APIARY NEAR BLOSSOMS.

*Question.*—What would be the difference, if any, in the quantity of honey gathered from a certain field of clover, basswood, or buckwheat, if my apiary is right among the blossoms, or from one to one and a half miles away? I desire to locate nearly a mile and a half from the thickest pasturage, but am undecided what to do for fear my bees will not do nearly as well as they would if I sacrificed my own convenience and moved nearer the better bee-pasturage.

*Answer.*—Theory claims, in view of the fact that bees do not know instinctively how to go directly to the nectar-bearing flowers in the vicinity of their homes, but must depend upon their smell and an industrious search for profitable honey-gathering, that therefore it stands to reason that less time would be lost in getting the whole force at work on the honey-producing flowers, where the latter are plentiful *very* near the apiary, than would be the case if the pasture-were from one to two miles away. □ It is claimed that every young bee which enters upon the service of field-worker must learn where the best forage-grounds are before it can work to the best advantage. □ Others claim that a hive whose bees all have to travel one or two miles from home for their stores will soon become depopulated, the result being a half less honey, with very weak colonies in the fall, over what would accrue had the apiary been located right in the midst of the flowers. Probably no one could give a very definite answer to the question without trying the experiment with an equal number of colonies right in the midst of the blossoms, and an equal number one or more miles away. I do not pretend to be authority in this matter; but my experience would indicate that those who argue that bees must be set right down in the very center of the honey-producing flora do this more from theory than from actual knowledge; for I am quite sure that there would not be enough difference in the results, at the distance named, to pay for moving the apiary up to the bloom during the time of blooming of the flowers, and back again for the rest of the year. Bees fly very rapidly, and the exercise seems to be invigorating; and if those who argue depopulation of hives could have been here last season when my bees worked for eight days on basswood from four to eight miles from home, and seen how the honey in the sections grew as if by magic with hives gaining in number of bees all the while, I think they would not put forth such fallacious claims. □ From proof, given in back volumes of GLEANINGS, I am convinced that bees go from one to three miles from home from choice; and if I were in

the questioner's place I would not give to the amount of ten dollars in sacrifice, in changing a position a mile and a half from the honey flora to one right in its midst. I have had good crops of buckwheat honey stored when there was not a square rod of buckwheat in sight of the apiary, and not to exceed 13 acres within the distance stated (a mile and a half), while hundreds of acres lay from three to five miles away. This, with tons of basswood honey stored from the top of the heights, seven and eight miles away from my apiary, during the past 25 years, leads me to think that the center-location parties have not had any practical experience along the lines they are talking about.

#### REARING QUEENS.

*Question.*—I have seen it stated that queens reared by natural swarming are superior to those reared from eggs laid in worker-cells. Is this a fact beyond reasonable question? If so, how do our queen-breeders secure the thousands they send out, all from swarming-cells?

*Answer.*—It would be but reasonable to infer that a plan of queen-rearing which brought vigorous healthy bees, all the way from before Samson's time down to the present, in their native haunts, must produce queens that were very good, to say the least. But to say that an egg laid in a queen-cell by the same queen was a better and more vitalized egg than was one laid in a worker-cell, is something that very few would be ready to assume. From years of close observation I can not think that there is any difference in favor of the egg, no matter where it is laid, whether in queen, worker, or drone-cells, providing said egg is properly fecundated; but the difference comes in the treatment of the innate life of that egg after it has come to the larval form. In natural swarming a larva intended for a queen from the time it first breaks its shell is nursed all its larval life with a fondness equal to any mother's fondness for her child; and in this nursing we have the part which plays for good or evil in the future queen. If by any means we can secure a like condition for the just-hatched larva from an egg laid in a worker-cell, we can secure a like-conditioned queen; and I have not a single doubt that thousands of the queens sent out by queen-breeders are every whit as good as those reared under natural swarming, for the most of our queen-breeders to-day spare no pains to bring about an equally favorable condition to that under which natural swarming is conducted while rearing their queens. Much poorer queens than those reared under natural swarming can be produced, and will be, unless the work of queen-rearing is done rightly; and it was because that, in the infancy of the queen-rearing business, very little attention was paid to the condition of the colonies while feeding the embryo queens that the subject of where the eggs were laid was advanced. God placed

man at the head of and gave him control over all animate nature, and thus it has come to pass that he has been enabled to equal, if not to improve, every thing which he has turned his hand to, and queens are no exception to this rule.

#### GOOD NEWS FROM CALIFORNIA.

I have just been out two hours in the rain, guiding the torrent (as it passes my apiary) to make it fill up holes, and level up things generally. The rain and snow have kept me from the postoffice. Three inches of snow and  $4\frac{1}{4}$  in. rain (including the snow); this time 17 in. total. This will ensure a honey crop here so far as rain is concerned. R. WILKIN.

Newhall, Cal., Feb. 18.

#### HONEY AND SALAD OIL FOR COUGHS.

Our people down here in Canada place much confidence in clover honey for medical purposes. Physicians often order it. A mixture of honey and olive oil is very efficacious for children troubled with severe cough. A lady was telling some time ago that her two little ones were perfectly cured in a short time by taking a teaspoonful three times a day, and said, smilingly, "I had no trouble to get them to take it; the honey did the coaxing for me."

A BEE-FRIEND.

#### BASSWOOD SEEDS; A SUGGESTION IN REGARD TO PLANTING.

I see in GLEANINGS that Bro. Root gave directions about planting basswood seeds. If we follow his directions here in Iowa the seed will stop in the ground two winters. I have had the best luck by planting it in the spring, then it would come up the next spring.

Lamont, Ia., Jan. 14. CHAS. BLACKBURN.

#### WEIGHT OF $1\frac{1}{8}$ -IN. SECTION.

I see you want an expression from your readers as to the weight of sections with honey. I use the  $1\frac{1}{8}$  sections, and in the last three years I find that the weight is from  $13\frac{1}{2}$  to  $14\frac{1}{2}$  ounces to the section. That would make the average 14 ounces. If a section weighs  $14\frac{1}{2}$  ounces it is well filled and of fine appearance.

Eudora, Kan., Dec. 14. LOUIS MOLL.

#### ADVANTAGE OF FULL SHEETS OF FOUNDATION IN THE SECTIONS.

I used last season brood foundation (as I had some broken) for surplus cases, and they worked well, for I put them in the full size of sections and reaped a good harvest by so doing. Hereafter I intend to use for starters the thin

or extra thin, and cut them full size and fasten top and bottom, so as to have them drawn out more perfectly and quicker. J. E. FOWLER.

Newfields, N. H., Dec. 21.

#### FROM 77 TO 123, AND 3 TONS OF HONEY.

I have 123 colonies in the cellar, and 100 are in dovetailed hives. Had about 3 tons of honey last year, comb and extracted together; about 5000 lbs. comb honey. I commenced the season with 77 colonies, spring count; increased to 123. I have lost but two colonies in my cellar in three years in wintering them. I have a side draft in my cellar all winter, and part of the time it is cold enough so that icicles form on the drip of the cistern. J. L. ROBERTS.

Bridgeport, N. Y.

#### BEEES BUILDING COMBS ON WIRES, A LA BOARD-MAN.

I read a letter in GLEANINGS of Mar. 1, from H. R. Boardman, page 160. Two years ago I wired 80 frames as an experiment, and I found that it worked just splendidly. I put a starter in each frame one inch wide, and I have some as perfect combs in those frames as you ever saw. You see, we can not all afford to use full sheets, and I for one don't want to. As an experiment I put one full sheet of foundation in one of those 80 frames, and that same frame was the most out of shape, and had the worst-looking comb in the whole lot.

Panama, N. Y.

J. R. CASSELMAN.

[One swallow doesn't make a summer; one frame of foundation proves nothing. Foundation properly wired almost invariably gives good worker combs.—ED.]

#### A COLONY OF BEES IN A STEER'S CARCASS.

The following interesting item appeared in the *Galveston Daily News* of Dec. 19, 1896. It may or may not be true:

##### BIBLE RECITAL RECALLED.

Waco, Tex., Dec. 18.—Jerry Friend, a hunters' guide and trapper, came down the Brazos River to-day in a skiff, part of his load being the carcass of a steer full of honey. The steer appears to have perished from some cause, and dried up in the sun after being hollowed out by mice and insects. The ribs supported the hide in almost life-like size and shape, and the cavity formed a hive for a colony of bees. The combs were fixed to the ribs and the backbone, and were full of excellent honey. Mr. Friend says the mention in the Bible of the bees making their hive in the carcass of a lion attracted his attention more than any other story in the Scriptures, and was recalled when he saw the carcass yielding twenty-two pounds of honey and comb. It was sold as a curiosity to a Philadelphian.

##### HONEY STATISTICS.

I see you quote California as probably giving the largest yield of honey—see page 42, Jan. 15. I have the *American Agriculturist Almanac* for 1896 page 326, honey product, which reads: Iowa, 6,813,412 lbs.; Illinois, 4,602,941; Missouri, 4,492,178; New York, 4,281,964; California, 3,929,889; Wisconsin, 3,515,761; Texas, 3,286,386. I should have thought that California would head the list, but Iowa does; and you take a

Hawkeye, and he does not want the name of his State assailed. According to that table, California comes in fifth. You can secure one of those almanacs by sending to the Orange Judd Co. These figures are for the decade from 1879 to 1889, compiled from census reports.

Albia, Ia., Jan. 23.

C. H. CLARK.

[The *American Agriculturist Almanac* probably gets its figures from the government reports, that are very unreliable so far as they relate to the production of honey in the various States. These statistics are gathered from assessors' reports, and are by no means accurate.

#### A HIVE IN A GREENHOUSE, WITH ENTRANCE OUTSIDE.

Could you tell me if it would hurt bees to be taken from where the hive stood on the ground, and put on the south side of a greenhouse, where the opening of the hive is outside, and communicates with the outside air all the time?

York, Pa., Jan. 11.

GEO. H. BUCK.

[The only danger would be that the extra warmth inside the greenhouse would cause the bees to fly out; and, once out, they would chill before they could get back. A better way would be to turn the entrance around to the inside. Some bees will bump themselves to death on the glass; but it is said by florists that they get over this.—ED.]

#### HOUSE-APIARIES.

*Dr. C. C. Miller*:—In the spring of 1895 my bees nearly all died. I wrote to you, and you answered my questions. I got very little honey this season. I have 50 colonies, I think, in good condition, and I have been thinking of building a house for some of my bees. I should like to get some plans for a cheap house.

Markle, Pa., Jan. 11.

F. BAIR.

[As this is of general interest, Dr. Miller sent it to us.—ED.]

A good many have tried house-apiaries, and given them up, while a few still think highly of them. As it is somewhat uncertain whether you would like any thing of the kind after trial, it might be well for you to try it first on a small scale, say a house for 12 or 16 colonies. The simplest kind of building will do—just wide enough for the hives and what space you think you need between them—perhaps 7 feet in all. If 12 colonies are to be housed then make the house long enough for 3 hives; if 16 are to be housed, make the house long enough for 4. The lower tier of hives will stand on the floor, and provision must in some way be made for supporting the second tier of hives above the first. A shelf may do this; and in order to avoid having any thing in the way of the lower hives, this shelf may be supported from above, somewhat after the fashion of a swinging shelf in a cellar. At the entrance of each hive must be cut a hole in the wall of the house, and a passage must be made from this to the entrance so that no bee can get from the hive into the house. After you have tried a small house first, you will know whether you want to build a larger one.

OR several days the routine of duties around the Buell residence was interrupted by equestrienne lessons, and soon Alfaretta became an expert rider. For a time

Prof. Buell would mount old Jake and accompany her; but observing that she managed the pony with good judgment he delegated the honors of attendant upon Gimp, and finally Alfaretta was left to roam the country at her will. Nearly every day herself and the pony were inseparable companions.

Sometimes upon the verdant bluffs she would picket Jack and stroll away to gather flowers; but should she get far away, Jack's whinny would recall her; or she would set up a communication with the pony with a peculiar whinny of her own. This horse language seemed to be understood between the two, and they were very fast friends. The river men, as they plied their trade up and down the winding stream, caught glimpses of the cantering black pony and the fluttering white dress, and she became known to them as the flying maid; and one of the boatmen went so far as to thus name his boat. To landmen for miles around she was known as the "mad beauty."

The autumn and the winter wore away; the free outdoor exercise developed strength and litheness of body; a ruddy glow painted the cheek; but, to the sorrow of the parents, no relief came to the clouded mind.

Many times when starting out upon her jaunts she would pat the pony's neck and say, "Now, Jack, we must hunt up Fred Anderson to-day." Her trysting-places for that laudable endeavor were at the old McBurger bee-ranch or at a point on the river-bank opposite the former site of the chalk butte and Fred's apiary. For many minutes she would search, peering through the bushes, and calling, "Fred Anderson! ho, Fred! come home—home!" The last word died away with a mournful wail, and with eager gaze and parted lips she listened for an answer. Receiving no reply she would caress the pony's neck, and say, "Fred is far away, but he will come to-morrow."

Prof. Buell continued his moral teachings at the Dawson ranch, and the Sunday-school had flourished in spite of the flood and hard times. In fact, hard times seemed to draw the people closer together for mutual benefit.

Early in the spring months a commodious schoolhouse had been erected not far from the Dawsons, and that was now the center for all moral, educational, and social gatherings; and on Sunday afternoon the school-bell called together a small but wide-awake Sunday-school.

The entire neighborhood had changed for the better, and upon none was this uplifting power more pronounced than upon Mrs. Dawson. The better nature and milder temper of her youthful days returned. The hard lines upon the face disappeared; and while greeting all with a pleasant word and a smile, upon none did she beam with more pleasure than upon Gus Ghering. The latter was evidently fascinated; and as matters progressed he was subject to many bantering jibes from his neighbors; and when he commenced to build an extended addition to his cabin, Matt Hogan took occasion to remark to one of the neighbors that Mr. Ghering was preparing to hive a whole swarm of Dawsons. And no one was surprised a few weeks later when a quiet wedding was announced, and Mrs. Dawson became Mrs. Ghering.

Matt Hogan, having a successful apiary in mind, had taken up a parcel of land about a mile from the river. Thither he had moved his bees and built a cabin, and here he labored and waited for his Biddy Malooney.

Alfaretta took but little interest in the transactions of the neighborhood, and no name would stir her to mental effort like that of Fred Anderson. Then she would arouse to alertness, and insist that she and Jack should search for him. In her efforts to pursue that search she came near crossing the river at the ferry a few miles above her home. Prof. Buell had thereupon instructed the ferrymen not to allow her to cross. Finding opposition to her little plans, she suddenly dropped all mention of Fred's name, and her parents imagined she had entirely forgotten him. But with all people who have a certain degree of insanity there is also considerable cunning; and Alfaretta possessed enough to further her vague plans. In her first futile attempts to find Fred she left the matter of guidance entirely in the hands (or, rather, feet) of pony Jack. Wherever Jack would carry her, there she would find Fred Anderson. Jack's idea of the matter was to follow the course of empire and go west; but the river and the ferrymen were a barrier to the passage of the "mad beauty" and her pony.

Nearly a year had passed since Fred Anderson's departure. One beautiful moonlight evening Alfaretta retired to her room earlier than usual, and to rest, as the parents supposed; and they improved the occasion by making an evening call upon neighbor Jo Splinter, who lived but a short distance from the river. Gimp Dawson was instructed to remain near the

house; but the professor, while giving his instructions, listened to Gimp's earnest appeal, and allowed him to go to the bend just above the house, to fish. Gimp was an expert fisherman, and supplied the table with many a dainty morsel from the river.

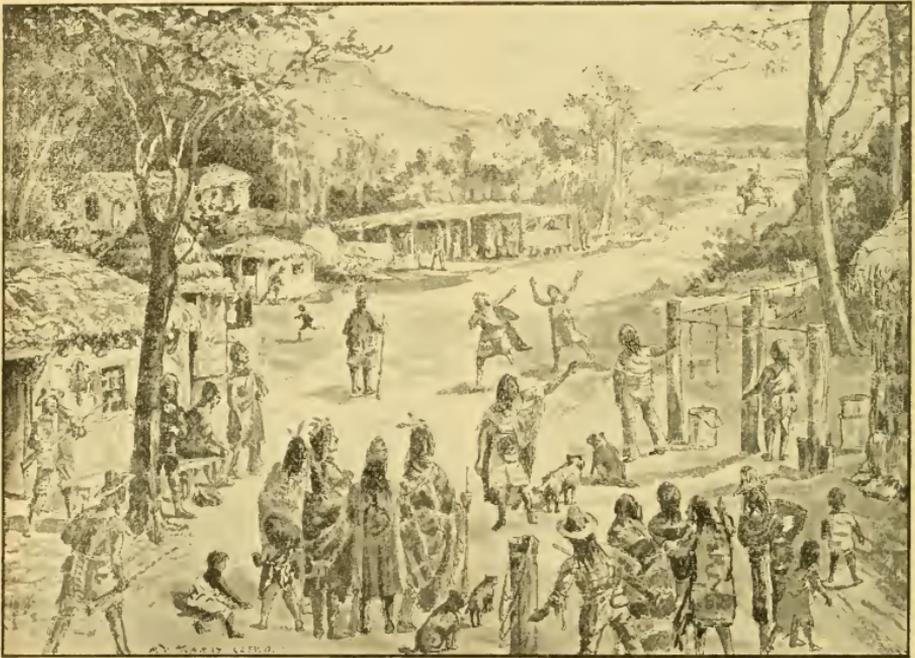

Gimp for a brief time had one eye upon the house and the other upon his fishing-tackle; but when the fish began to bite he lost all interest in the house, and directed his attention to the fine fish he was taking.

Alfaretta, after a half-hour's rest, came from her room, and, finding the house deserted, became nervously alert, laughing softly to herself. She tiptoed into the pantry, and put a lunch into a little hand-bag. Then, taking the

ing, and he hastened up the river-bank only to hear the sounds dying away. "Some o' them Spaniards that live up at the cove," he remarked as he proceeded to bait his hook again. "But suthin' tells me to go over to the house;" and, suddenly dropping his pole, he said, with emphasis, "I'll go."

He found the house quiet enough; but when he went to the corral and found Jack gone he became greatly excited. "Jimminy crack-horn!" said he; "that gal's clean gone—in the night tu."

Gimp was a boy of action, and he hastened down to the pasture lot for old Jake, and he was soon ready to follow. Before leaving the house he scrawled upon a piece of paper the

"THE WHITE SQUAW! THE WHITE SQUAW!"

professor's heavy macintosh, she quickly ran to the corral.

Jack met her at the gate, and rubbed against her in an inquiring way, as much as to say, "Where now, my dear?"

"S—h!—s—h! Jack." Then in an undertone, while saddling the pony she crooned her old song; and as she climbed into the saddle she exclaimed, "Now, Jack, it is Fred Anderson we must find—find; away to the hills! on fairy tiptoes, away!"

Jack responded, and struck off up the river at a rapid gallop. The lively staccato of hoofs upon the hard road aroused Gimp from his fish-

following message:

"Alfaretta be gone; so be I gone after her, up river."

This he left tied to the door knob.

Jake was no match for the lively Indian pony, and for every mile Gimp made on his back the pony made two. But Gimp was blindly persistent, and had in mind that Alfaretta would stop to rest the pony by and by, and then he would catch up with her.

At the first ferry, where she had so many times been refused passage, she did not halt; but at the next, ten miles from her home, she allowed the pony to have the bit. She imme-

ately turned down the ferryway, and upon the boat. A man on horseback, and a party in a wagon were also crossing. Alfaretta being enveloped in the macintosh, and it being late in the evening, the ferryman had no suspicions that his boat was bearing the mad beauty across the river until he made his round to collect the fares. "Fare, please," said he to the dark figure upon the pony. For a reply, Alfaretta began to sway her body, and croon, "Rumbles and gumbles, skies clear; gumbles and tumbles, moon fair—fair."

Then turning suddenly in the saddle she bent low, her face almost touching the surprised boatman. "Ha, ha!" she laughed; "see my teeth!"

The latter was said with a hiss and a grimace that gave a chill to the boatman. The front end of the boat was now grating upon the shore gravel. Alfaretta touched the pony with the whip, and she responded by leaping into the shallow water, and jumped to land; and the last the occupants of the boat heard was a weird song from the bluff:

"The night is stormy and dark," etc.

"That mad beauty, by ginger," said the boatman. "Well, I can't help it. If her folks can't keep her in nights, don't know as I am bound to chase around after her. Say, Jim, you are on horseback; spose you follow her up."

"Not much," said Jim; "don't want my nose bit off an' eyes scratched out. She's a witch." And Alfaretta was left to pursue her journey unmolested."

It was, to all appearances, a crazy idea of a crazy person to start out under cover of night to search for Fred Anderson, not having the least idea of his whereabouts; but she had great faith in her imaginary mermaids and the utmost confidence in Jack. The latter was worthy of it, for an Indian pony never forgets its home. In their fishing-excursions to the various streams, and in their annual migrations as hop pickers to the hop-fields of the Sacramento Valley, the Indians and their ponies become familiar with a wide area of country; and this night, after crossing the river, the pony made rapid progress, for every lobe was toward its home.

But even horse flesh will tire; and about midnight, Jack, of his own accord, turned into a little arroyo where there was water and grass, and began to browse and drink. Alfaretta, patting the pony's neck, dismounted, removed the saddle, secured the long slender lariat to a bush, and Jack was left to rest and eat, while Alfaretta partook of her lunch, and, wrapped in the heavy macintosh, she crooned her song and kept a fitful vigil over the pony. In the early morning, away pony and maid again hastened. It was about midday when Alfaretta galloped into the little settlement of

Covelo, just on the borders of the Indian reservation. The pony halted for a drink at the only watering-place—a tank in front of a saloon.

A stranger in these out-of-the-way towns, be it man or woman, is an object of curiosity; and the pony's nose had scarcely touched the water when a long lank individual, dozing in a chair under the generous awning, aroused, unfolded himself, and approached the rider, and proceeded to get acquainted by saying, "How d'y'du, gal? That's a right smart of a pony yer have thar. Mout yer be goin' fur? Ef I can be of sarvice"—but the man was suddenly interrupted by Alfaretta leaning toward him, and, with a grimace, she shouted, "Bum, bum, go-baa-baa!" and concluded by striking him over the head with her light riding-whip. The pony immediately struck off at a gallop, and the discomfited meddler turned to the laughing crowd that had collected, with the angry remark, "By Jericho! ef a man had done that, by Jericho I'd a shot 'im dead; but ef I don't b'lieve she's that ar' crazy gal I've heerd so much about down at Colusa."

"Ha, ha! Jim, that's a good way to turn it off," said a woman in the crowd. "You needn't think you are over in Missury, whar everybody's bizness is your bizness, and your bizness everybody's bizness. 'This is Californy, whar yer've got ter mind yer own bizness. That gal ain't crazy 'tall. She's one o' them towerlists who don't know any better'n to go gallup-adin' round the country with a double-barreled spy-glass and a camery a insultin' decent folks. Oh! no, Jim, she ain't crazy onless the hul lot on 'em are."

While the people were discussing Alfaretta's action, the pony was rapidly carrying her into Round Valley. As the pony approached its former home its pace increased. Under the heat of the day, and the exercise, Alfaretta had thrown aside the macintosh, and her fluttering white dress would have made her conspicuous but for the lonely road she traveled. Two hours' riding, and pony and white-robed rider flashed into the broad plaza of the Indian rancheria. The pony gave a loud whinner of joy and recognition of home, and so aroused the entire rancheria. The men awoke from their dozing; the dusky half-clad children scrambled into the wooden wickiups; the squaws, after one glance at the white-robed figure, one and all ran hither and thither in confusion, hair streaming, arms uplifted, hands clasped, and shouting in despair, "Ban-owoya! ban-owoya!" (the white squaw! the white squaw!)

---

Please allow me to congratulate you on the end-spacing staple which you have already shown us in GLEANINGS. I think it will prove one of the most successful improvements that as yet have been offered to bee-keepers.  
JAS. PRATT.  
Cumminsville, Neb.

BEES appear, so far, to have wintered well. Our own are in excellent condition, and the reports from over the country are good.

THIS NUMBER goes to press just too soon to get the result of the vote for officers of the United States Bee-keepers' Union. It will be given in our next.

WE are and have been printing eight extra pages. The large amount of good advertising matter that we are now having makes this necessary in order to give our readers the usual amount of matter.

PROSPECTS for the California apiarists are good. They have had good rains, and that usually means honey. Bees died last season for many bee-keepers who thought they could not afford to feed. Those who did feed will now get their money back with good interest, probably.

TWENTY years ago there were scores of would-be inventors who made a specialty of moth traps. The Patent Office has issued hundreds of patents on these worthless things. Strangely enough, there are bee-keepers *even to day*—I do not believe they take any bee-journal—who are wasting their time and money in the same line. Two such chaps wanted to sell their rights to us at fabulous sums. The old saying is true: "The fools are not all dead yet."

#### TOO MUCH TALK ABOUT "FISHBONE."

Is there not danger that so much talk on the part of bee-keepers regarding fishbone resulting from the use of foundation in sections, will do harm rather than good? Consumers are *now* satisfied; but if we as bee-keepers go to talking now about artificial fishbone we shall begin to create distrust from our customers. Foundation has been used in sections for 20 years or more, and yet the average consumer has never made any fuss about fishbone, because he has not and does not know the difference between foundation comb honey and comb honey in which no foundation has ever been used. When we come right down to it, there is comparatively little fishbone; and as the years go on, I feel confident that manufacturers of foundation will be able to make an article where the fishbone can not be detected by even an expert. I confess I have said a good deal about it in this issue myself, but I hope not in a way that will prejudice the consumer against comb honey, a very large proportion of which is built from full sheets of foundation.

THE editor of the *American Bee Journal*, in referring to new appliances, gives the advice to prove all things, testing on a small scale. If the first acquaintance in a small way proves to be satisfactory, buy more next time. We have several times uttered a similar thought in our columns, but it will bear repetition. A new article that has honest value in it, with proper advertising, is bound to earn its way.

A SHORT time ago friend Bingham expressed himself as believing there were no patents on foundation-mills. Something like a dozen, I believe, have been issued. The most important were from the following-named parties: W. C. Pelham, Mrs. Frances Dunham, E. B. Weed, and last, but not least, the lamented Samuel Wagner. The latter obtained the first patent. For two years his assignee, Mr. Perrine, prevented us from making foundation-mills and foundation, there being two years more life to the patent.

#### PATENTS ON EXTRACTORS.

SOMETHING like 100 patents have been taken out on honey extractors, in the United States—at least, we have on file in our office that number. It seems now as if no patent that might be issued would be worth any thing to the inventor.

By the way, certain parties are representing that our four and six frame Cowan reversible extractors are an infringement upon a recent patent. The vital features of our Cowan extractors are 15 and 25 years old—at least, we can show printed matter showing where such principles were in use at that time.

#### THE "DON'T PAYS."

THE editor of the *American Bee-keeper*, referring to a certain class of people who run in debt and don't pay, says:

One of the meanest things that any one can do is to buy goods of a firm on credit, and when he has reached that point where he will be trusted no longer, to put off paying his account, and buy goods for cash elsewhere. This sort of thing is done to a considerable extent even among bee-keepers, and we have in preparation a list of some who have served us in this way.

It is indeed true that "this sort of thing is done to a considerable extent." If the W. T. Falconer Co. will send us a list of their "don't pays" we will return the compliment by sending them a list of ours. By the way, it would do no harm if manufacturers and dealers would exchange lists.

#### BEEES BUILDING NATURAL COMB ON WIRES.

ON page 160 Mr. H. R. Boardman gave an item regarding bees building combs on wires without the use of foundation. Since that time quite a number have written that they have tried the plan, and that it works very successfully. A few days ago Mr. Boardman sent us a frame that had been wired perpendicularly.

It was interesting to note how the bees seemed to follow down the wires (without foundation) with their fins and patches of comb. To secure this result, the wires were first coated with wax.

It will be remembered that, in natural-comb building, bees following the comb-guide will build down several patches of comb more or less pear shaped. These different patches, as they enlarge, finally unite, and at the point of juncture there are necessarily irregular cells—many of them drone-cells. For our use we should greatly prefer full sheets of light brood foundation on wires, and then every cell is uniform, leaving little chance for the rearing of drones.

#### FAIR CRITICISMS AND SLURS.

REFERRING to foundation made without any side wall, as mentioned in another column, the machine for making which we made, Mr. T. F. Bingham says:

A machine that will do such work is a great credit to the maker of it. Figs do not *grow* on thistles. The man or firm of men using capital and talent in development of enterprises that are for the good of all and the injury of none should be recognized without a battle.

T. F. BINGHAM.

Farwell, Mich.

This is as generous as it is kind; for it must be remembered that Mr. Bingham differed with us in regard to the policy of putting out the new drawn foundation. But such a spirit as is manifested above will readily yield, if wrong to, reason and to the developments of the future. Almost the same sentiment has been put forth by Mr. Hutchinson, who thinks or did think as Mr. B. Such sentiments stand out in marked contrast to the uncalled-for statements in the *Progressive Bee-keeper*. We are willing to meet fair criticisms, but prefer to ignore, as a rule, any thing else.

#### CALIFORNIA HONEY-ADULTERATION LAW.

A LAW, a good stiff one, has recently been enacted in California, to prohibit the adulteration of honey. It is very specific, defining the meaning of extracted honey, and what shall be construed as adulteration. It would be a good one for other States not now in possession of such a law. Here is the text:

SECTION 1. No person shall, within this State, manufacture for sale, offer for sale, or sell any extracted honey which is adulterated by the admixture therewith of either refined or commercial glucose, or any other substance or substances, article or articles, which may in any manner affect the purity of the honey.

SECTION 2. Every person manufacturing, exposing, or offering for sale, or delivering to a purchaser, any extracted honey, shall furnish to any person interested, or demanding the same, who shall apply to him for the purpose, and tender him the value of the same, a sample sufficient for the analysis of any such extracted honey which is in his possession.

SECTION 3. For the purposes of this Act, "extracted honey" is the trans-formed nectar of flowers, which nectar is gathered by the bee from natural sources and is extracted from the comb after it has been stored by the bee.

SECTION 4. Whoever violates any of the provisions of this Act is guilty of a misdemeanor, and upon conviction thereof shall be fined not less than

twenty-five nor more than four hundred dollars, or imprisoned in the county jail not less than twenty-five days nor more than six months, or both such fine and imprisonment. And any person found guilty of manufacturing, offering for sale, or selling any adulterated honey under the provisions of this Act, may, in the discretion of the court, be adjudged to pay, in addition to the penalties hereinbefore provided for, all necessary costs and expenses, not to exceed fifty dollars, incurred in analyzing such adulterated honey, of which such person may have been found guilty of manufacturing, selling, or offering for sale.

SECTION 5. This act shall be in force and take effect from and after its passage.

#### SELLING THE NAMES OF BEE-KEEPERS A BAD POLICY.

THE selling of the names of bee-keepers, I firmly believe, is bad policy, and decidedly detrimental to bee-keepers. We once sold the names of catalog applicants; but we discontinued the practice years ago. Since Bro. Hutchinson has begun selling his list of names I notice that several snide commission houses have got hold of them, and are sending out their circulars, and, of course, some bee-keepers bite, and get badly bitten in return. It is truly astonishing to note the number of fake commission houses that have started up in the last year or so, and they all seem to make a specialty of honey. The first thing they try to do is to secure a list of bee-keepers. They get in all the honey they can, sell it, and perhaps skip the country, the same as Wheadon did. There are several other mushroom concerns that probably contemplate the same tactics. If they could not secure the names of bee-keepers for love nor money, they probably could not bait their suckers so easily. There is no harm in selling names to reliable well-known bee-keepers, but I believe it would be wise for Mr. Hutchinson not to sell to outsiders.

The readers of bee-journals, I believe, are not very often caught; for I have before me the names of two bee-keepers who are not subscribers to our paper, and I should judge they do not take any paper devoted to bees. They have shipped their honey, large lots of it, to these people. On referring the names of the parties to us we can not find that they are even mentioned in Dun or Bradstreet. One party we had Dun hunt up. He finally found him in New York, after considerable search. His record is crooked, and, after getting in debt in one town, he goes to another, and now he is operating in New York.

It takes almost no capital, you know, to go into the commission business. A few dollars will pay for the rent of a room or two, a few dollars more for stationery with a high-sounding name, plenty of cheek, and just enough knowledge of law to evade it. On this basis some rascals do a thriving business. We have said so much about crooked ways that I am afraid it will get to be an old chestnut; but it seems very necessary to *keep harping*, for occasionally a subscriber to a bee-paper is caught.

A FEW MORE FACTS ABOUT THE FLAT-BOTTOM DRAWN FOUNDATION.

A GOOD deal of theorizing and useless speculation is now being indulged in with regard to the new drawn foundation, or what we have been calling deep-cell-wall foundation—speculation as to what it will be and will do—not what it *is* or *has* done. Theory amounts to nothing when set over against fact; and for the purpose of enforcing some of our former statements, and disproving some of the various opinions recently set forth, we have called into requisition the camera. There is nothing more truthful than a photographic negative; and, thanks to the new process of half tone engraving, a photo can be reproduced in all its faithfulness for the benefit of the general public.

Mr. Weed has taken various samples of comb foundation, of natural comb, of comb drawn from *ordinary* foundation, and of his new drawn foundation, and placed them in plaster casts. It is impossible to get a cross-section of a piece of comb or foundation without causing a burr edge; but by placing them in plaster, and then taking a cross-section of the whole, a *clean-cut* sectional view is secured. The accompanying engraving shows several chunks of plaster through which a cross-section has been made. These chunks are held together by means of black dental wax to secure better contrasts in the photo.

No. 1 shows a piece of comb drawn from light brood foundation. No. 2 shows the foundation itself before the bees have touched it. No. 4 is a view of extra-thin foundation also untouched; 3 is natural *drone* comb built by the bees *without* the aid of foundation. No. 5 shows the new drawn foundation; No. 6 the cast comb, made by Otto Schulz, of Germany.

We have made the statement that bees will thin down the *walls* of foundation to a natural thickness, but seldom if ever touch the *base*. That statement is abundantly proven by a comparison of Figs. 1 and 2. It should be said, however, that the sectional view of foundation at 2 is not taken at the same sectional line as at 1. A little more slicing off would have shown the base the same thickness at No. 1. Now, then, if the base at 1 in the original foundation had been thin, and plenty of wax in the walls, we should have had a comb without a midrib. It is apparent, then, that in light brood foundation a very perceptible midrib is left; and even in extra thin, as at 4, there will be some midrib.

Nos 1 and 2 are only duplicates of dozens of other samples we have taken. If, then, 1 and 2 are fair samples, as indeed they are, it goes to show that what we at present need is *thinner* bases and *more* wall. The results of R. L. Taylor's experiments along these lines, as reported in the *Bee keepers' Review*, are quite in harmony with what I have just said, and with the photographic view, and Mr. Hutchinson appears to have overlooked or forgotten this,

for he seems to favor a foundation all base and no wall. If it is all base, and the base could be made as thin as natural, it would sag in drawing out; and, besides, I think the bees would be very much inclined to gnaw it down.

Very recently Mr. Hutchinson, Mr. Bingham, and a few others, have been asking for a foundation without wall. Accordingly, in a round-about way we received an order for a mill that would make the mere midrib but *not the walls*. We had but little faith that such an article would be of any use; but we made the mill, and secured some beautiful results. This mill was shipped to our customer. Later on it was a little amusing to have samples of this same mill sent back to us as the triumph of a new achievement.

If one will look over the photo very carefully he will see that it is not the *absence* of walls, but the *presence* of them, that is needed. In a word, thin bases, with plenty of wall, is the desideratum. Mr. Weed realized this fact years ago, and now because, forsooth, he proposes to put the surplus of wax in a deeper wall (instead of a thicker one) and make thinner bases, Mr. Leahy hints that we are in league with the adulterators—that we are about to ruin the comb-honey business. None are so blind as those who won't see.

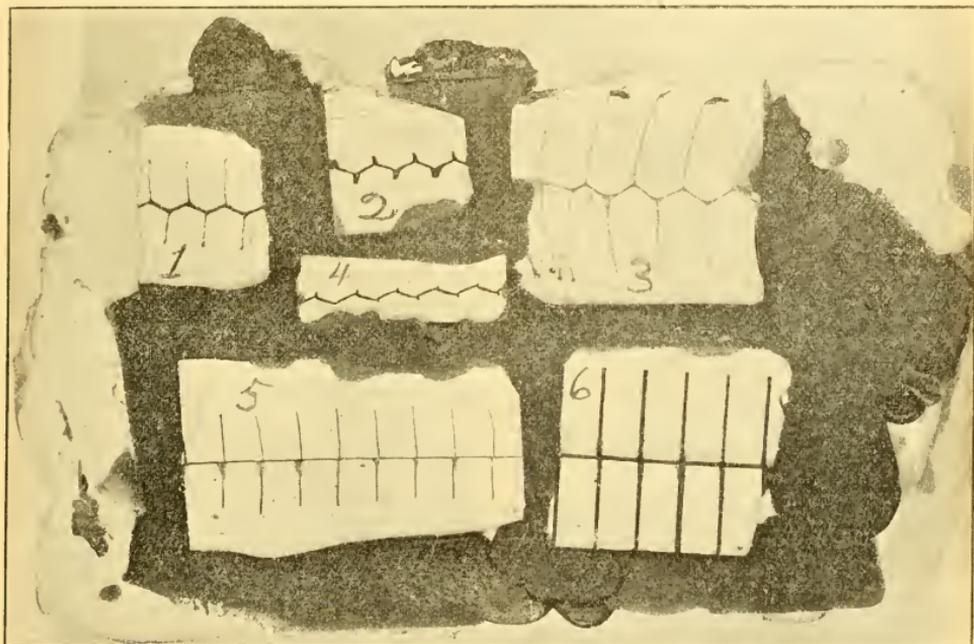

No. 5 is a sample of the new drawn foundation, the walls of which are considerably deeper than would be practicable or desirable for us to make. It will be observed that the base appears to be as thin as natural; but it is in fact a little thicker. The sample in question was made on a smaller machine, with which it was not possible to secure as perfect results as with the larger one which is now nearly completed. Let it be understood that 5 has not been touched by the bees in any manner whatever. It is just as it left the dies. The product from the new machine will have cell walls probably about  $\frac{1}{16}$  inch deep; or, in other words, it will be deep-cell flat-bottom foundation. We might make deeper walls, but there is no advantage in it, and the probabilities are that the new foundation with walls  $\frac{1}{8}$  inch deep will be deep enough. It will readily be seen that there is not the least danger that this article—a flat-bottom foundation—will be put into tumblers of glucose and be used to defraud the gullible public.

While we may be condemned by a few, for the present, we have perfect confidence that the future will fully vindicate us. While we do not even now claim that we shall be able to make the article a commercial possibility, we do assert that, if we ever shall do so, there will be no fraud about it. There is only one way the product can be made, and that will be covered by patents that will prevent dishonest persons, even if they could, from making a fraudulent use of it.

I have said that the cell walls of No. 5 are  $\frac{1}{1000}$  inch thick; that those of the natural *worker* combs are  $\frac{3}{1000}$ , or the same as the walls in No. 1. Now, then, if the walls of 5 are thinned down to  $\frac{3}{1000}$ , will there be more "gob" in the mouth of comb built from it, than from natural *drone* comb as shown at 4? As I have already shown, 4 has a much heavier base, and the "gob," if present at all, will be more apparent in 4 than in 5, for the naked eye easily perceives the difference. Much has been said of late in favor of natural bee-comb; that it is more eatable, and has less fishbone, etc. As a general rule, if bees are left to themselves without foundation during the honey-flow they will build *drone* comb; and careful measurements

wall appears to be a little heavier at the point where it unites with the base in some of the cells.

We have reproduced 6 because it is an interesting curiosity. That the bees will accept it, there can be no question; that they will thin the walls down to regulation thickness is probable; but, oh dear me! who pays for the waste wax that is taken off from these walls? or do the bees utilize it in some mysterious way? No. 6 would be very much better if the walls were  $\frac{1}{2}$  or  $\frac{1}{4}$  inch deep. It would then be much like our old deep cell-wall foundation that we have made on roller mills for years to supply our German friends. It may not be generally known, but it is a fact, that we have made

CROSS-SECTION OF COMB AND COMB FOUNDATION BEFORE AND AFTER WORKED BY THE BEES.

show that both the walls and the bases are much heavier than those of worker. In fact, there is as much "fishbone" in such comb, probably, as in *worker* comb made from extra-thin foundation; but in the new drawn foundation it is proposed to have the base *thinner* than the bees make it in *drone* comb without foundation; and I leave to our readers to judge whether there will be more "gob" or fishbone in comb made from samples like 5, having cell walls about  $\frac{1}{1000}$  inch deep, and thinned down by the bees, than in samples like 3.

It should be stated in connection with 5, that in the corners of the cells the plaster flaked off a little; and the consequence is, the

foundation with heavy walls, and deep enough to make the foundation in the aggregate about  $\frac{1}{4}$  inch thick; but, unavoidably, there was a very heavy base.

*Later.*—A few moments ago Mr. Weed brought up a comb covered with bees, in the center of which, 18 hours before, he cut out a square hole, and inserted a piece of foundation and a piece of the new drawn foundation. The bees immediately began to tear down the former and to build the latter out beautifully, thinning down the walls at the same time. Remember, this was in the month of March, without feeding. What would be the results in a honey-flow in June?

#### MONTEZUMA'S CASTLE.

Some ten or twelve miles from Camp Verde there is an aggregation of cliff dwellings containing one central block of dwellings, so extensive that it has been named Montezuma's Castle. We started out one morning to explore it; and when several miles away we caught a glimpse of the cliff, and had a fair view of the castle. When within perhaps half a mile of the place—and it didn't really seem to be half a mile—from a little eminence we had a very good view of it. It was just over a little hill that lay before us. Our road went around the hill instead of going over it. Mr. Elvey, who had been there before, felt pretty sure we could make a shorter cut by striking off across the desert, and so we ventured to try it, although he and Mr. Carey both had told me several times I had better not undertake going "cross-slots" on my wheel where the road seemed unnecessarily circuitous. You ought to have seen the open-mouthed astonishment depicted on our countenances when we got over said hill, to find there was a cliff, sure enough, but no castle nor cliff dwellings in sight. Where had they gone? There was still another hill before us, and it seemed quite probable they were over this hill. So we started again "cross-slots" through the brush and desert herbage. Before we knew it we came to the brink of a very steep bank—too steep for any horse and wagon. Then we spent some time going up and down to see if we could not find a place to cross. I made my wheel do service in this respect. After considerable trouble in clearing away a place for the horses we forded the creek and got up on the opposite bank and into the traveled road. Moral—beware how you leave the beaten track, especially in a strange land. If we had kept the road the horses could have trotted around to the place it had taken us toward two hours to reach by our short (?) cut.

Before we explored the castle, Bro. Elvey had to cut a bee-tree where he saw bees going in and out of a knot hole several months before. As neither bees nor honey appeared when he got into the hollow, we bantered him considerably about imagining he saw bees going into the hole when it was probably nothing more than mosquitoes buzzing around. Finally, however, he reached his hand in and pulled out a sheet of dry honey comb. This restored his reputation for veracity. It seems that bees do starve out, even in a country where blossoms of some kind are to be found almost every day in the year.

I tried hard to get a picture of this castle, but did not succeed. The cliff is about 200 feet high, the top projecting over so as to shield the castle pretty well from the weather. As one looks at the work away up under this overhanging cliff, he is again reminded of the swallows' nests under the eaves of the barn. The castle is five stories high. There are perhaps twenty or thirty rooms in it. The lowest one is at least 75 feet above the stream below. Just as we were getting ready to explore, our good friend Rev. Mr. Healy joined us. Three of us managed to creep up the sides of the rock by means of a rude ladder; but Mr. Healy, who is a rather heavy man to climb, discovered an easier way by starting quite a distance away and walking along a projecting ledge.

The structure was evidently added to at dif-

ferent times. The front wall runs straight up, and the only thing to indicate where the different floors are located are the projecting ends of the timbers that support the floor. These sticks of timber were probably cut off with stone axes, or burned in two with fire, to judge from the projecting ends. Round poles not unlike what we use for bean-poles are laid across these sills, and across the poles are spread wild rushes, and over the rushes a layer of earth. One is impressed again by the fact that these people must have been small or else their rude floors would have broken through; for with the weight of a heavy man they spring down in a way that makes it seem dangerous. I was the only one in the party, in fact, that crawled up to the very highest loft. There are no stairways, and these people evidently carried ladders to climb up from one story to another. Some of the stories are so low that a tall, active boy could get up through the hole in the floor from one story to another without the aid of a ladder. The uppermost room is the finest of all. Back under the overhanging cliff is a sort of cave. This cave is so much larger than the average cliff dwellings that I imagine it might have been used as a sort of council-chamber. This cave is walled in, like the rest, but outside of the wall there is a sort of porch or veranda running to the right and the left, each way, perhaps twenty or thirty feet. On the extreme edge of the porch the walls of the castle below rise up so as to form a sort of parapet about waist-high. Here one can stand and look over the valley below. In case of a siege this would have been an excellent place to cast rocks down 150 feet or more on the heads of the enemy. The features of the separate rooms in the castle are so much like the cliff dwellings already described that I need not mention them here.

We found great quantities of corncocks, such as I have before described, and Mr. Elvey found a shell that was, without doubt, from some sort of squash. In fact, it looked very much like the hard shell on the outside of a Hubbard squash. In an article that appeared a few months ago in *Harper's Monthly*, I am told they have actually found grains of corn and other seeds in these cliff dwellings. Why don't some of our enterprising (?) seed-men advertise varieties of corn or vegetables, the seed of which was obtained from the cliff dwellings—that is, if it is a possible thing to make garden seeds of any sort grow after they are toward a thousand years old? Fragments of pottery quaintly ornamented, both inside and out, are found everywhere. These people must have had muscle and energy or else they never would have consented to live where they had to climb these cliffs every day when they went home to dinner. It seems a little strange that no such thing as a chimney was ever invented, for the smoky ceiling and rafters indicate that fire for cooking or to get warm by was built on the earthen floor, and the smoke got out as best it could. After the ceiling got smoked over so as to make the room dark and sooty they had a plan of mixing up a sort of whitewash made of the limestone rocks all about them, and whitewashing the room very nice and clean. This thing has been gone over so many times that some of the rocky ceilings contain ten or twelve different coats of whitewash and soot alternating. Strangely enough, the rooms smell of the soot and smoke even yet, although hundreds of years have probably elapsed since any fire was built there.

In this vicinity several mummies have been lately discovered, as I have mentioned before. My companions, who were all heavy men, de-

clined going up into the battlement I have described, because the masonry has already in several places broken away from the rocky cliff so as to leave considerable fissures; and many times even my weight made the structure rock as though it might soon all tumble down into the valley below.

## OUR HOMES.

Be not conformed to this world; but be ye transformed by the renewing of your mind, that ye may prove what is that good and acceptable and perfect will of God.—Rom. 12:2.

There are a good many things that are wrong in this world; and it puzzles a Christian a good many times to know just what he ought to do under certain circumstances in regard to these matters. Sometimes these wrongs that come up before us appear so great that righteous indignation seems appropriate. As I grow older, however, I find it an excellent plan, when I feel like condemning others, and condemning the world, to wait a little and inquire carefully of myself whether I myself may not be more or less to blame for the existing order and condition of things; and such examinations do me good. Sometimes the searching power of the Holy Spirit reveals so much that is bad in my own life I feel almost as David might have felt when Nathan said to him, "Thou art the man." It is an easy matter to recite and relate the iniquities that are going on round about us. It becomes *exceedingly* easy, in fact, nowadays, to raise our hands in holy indignation (if that is not too strong a term) when we hear of the tremendous salaries that some of our public officials are getting; and I do myself certainly think it is not only too bad but a burning shame that farmers who are getting such very low prices for their produce should be taxed just as they have always been in order that county, State, and government officials may have these great salaries and live in such style. It certainly is wrong; but who is to blame for it?

Now, dear friends, I think it will do us all good, and, furthermore, it will help us to remedy the matter when we begin to search our own hearts, and see if we, at least a great many of us, are not more or less to blame. A few weeks ago there was talk about enlarging and improving our Statehouse at Columbus, and to the extent of something like a million of dollars. Our sensible governor, however, vetoed the measure. I remembered that some one said through the papers, that, in order to make these improvements, they would have to tear up and destroy a lot of sawed-flagging walks that had only just been put down at an expense of many thousands of dollars.

Now, dear friends, our beloved State of Ohio is not the only one in the Union that is thinking about such pieces of extravagance. When I was in the city of Albany, some years ago, at a bee-keepers' convention, my attention was called to some beautiful and expensive carving in the Statehouse, but it was put in some dark out-of-the-way corners where nobody could see it, and probably had scarcely been noticed since the work was executed. Those having the matter in charge made an excuse for their extravagance by saying they did it to furnish needy people employment. To state it more plainly, the great State of New York taxed her hard-working farmers in order to get money for expensive decoration; and after said decoration was done, they admitted that it was of no

use to anybody, but they did it to furnish somebody *work*.

It is not only the fashion now, but it has been a fashion for quite a few years back, to make appropriations running away up into the millions, for doing something or other that is only, when you come right down to it, "tomfoolery." I know of no other word that expresses it more briefly.

When I was in New Orleans friend Winder took me through the great postoffice building, which was completed a good many years ago; but there were vast rooms, expensively decorated, that had never been used at all. They were beautifully lighted, and warmed by steam. In fact, they were too warm for comfort. I do not know exactly whose money paid for making great massive rooms that nobody needs; but Uncle Samuel had to foot the bill, or is footing it in some shape or other. A good deal of it seems to be owing to stupidity and bad management.

Now, I think I had better stop right here before I give many more such illustrations, or our good friends may get the idea that A. I. Root is not a true and loyal patriot. What shall we do about it? Commence a reform at home. Almost every large business establishment makes more or less blunders, and throws away more or less money in like tomfoolery. Even when they are hard up, and paying heavy interest, they often do this. I once heard of a railroad engineer who expended thousands of dollars in preparing for laying a track through the hills of Southern Ohio. The company that employed him, however, became so well satisfied that he lacked in judgment they turned him off and got another engineer. The new man selected a better route, and built the road for less money than his predecessor had used in getting his plan half done. This was a fearful example of lack of judgment or lack of fitness for his calling. In our establishment I could take you down into some of the unused basements, and find machinery that cost a good many dollars, which was discarded almost before it was ever used at all. I can not well blame anybody just now, for it was A. I. Root himself who decided on making the purchase.

Years ago I happened to step into the back room of a wholesale jewelry establishment. I saw there a beautiful clock worth a good many dollars, lying in the rubbish-heap. The decorated glass front was broken in shipment, and it was tumbled with other like damaged stuff back into the corner, covered with dust and cobwebs. This jeweler failed in business a few years afterward, paying only a small per cent.

Now, it is not only our government, and it is not only at the capitol of our several States where these things are going on. The great railroad companies are not the only ones who make blunders; neither is it the manufacturers nor the wholesale dealers who alone waste their hard earnings. When I happen to get a chance look into the empty corncribs of some of my farmer friends I find things that have cost a good deal of hard-earned money out of repair, and stored away out of sight. They are not always "out of sight," however, for sometimes nice and beautiful agricultural machinery is left right out in sight, and out in the rain and snow all winter long. You all know more or less about this. And can we blame the government of the United States for doing what many of her people do? Yes, and the very men and women who let high-priced tools stay out in the weather, run in debt for more high-priced things to keep in fashion.

And now I am getting around to the point of my text, somewhat. I do not mean to say we

should make no effort at all to dress like other people, and to furnish our houses like other people; but I do say that it is my honest belief that a great part of our troubles are caused by our trying so hard to conform to the "fashion of this world" when we honestly can not afford it. I have not (as yet) purchased or worn a pair of toothpick-toed boots or shoes. I do not believe it would be best for me to say emphatically that I am *never* going to wear them; but I have been thinking pretty strongly that I should never conform to this extreme fashion in foot-gear—I mean the kind where they run away out to a point so sharp that they may well suggest the idea of toothpicks. It always makes me think of the caricatures where the prince of darkness is pictured with exceedingly long and pointed toe and heel; and I am really afraid, fathers and mothers, and boys and girls, that the evil one has may be a little to do with these sharp-toed boots and shoes. When we were discussing the matter the other morning at breakfast, somebody said that *everybody* who tried to be well dressed had bowed down and accepted the new fashion. When our good pastor the other Sunday morning, however, was speaking, I happened to look down to his neatly dressed feet, and felt glad to see him wear square-toed boots like my own, and I am quite sure nobody in Medina would think of calling him in *any* respect old-fashioned.

In a certain household I heard them talk about discarding a beautiful oval-top extension dining-table. It was made of the finest wood, and showed the very nicest workmanship; and the careful housewife had kept it so it was almost as handsome and perfect as when it first left the cabinet-maker's store. I remember of thinking, when the fashion came in for cutting off the sharp round corners of our dining tables, that it was really a humane improvement. Not many years ago a child was killed by running against the sharp corner of a table. The oval tables are so much prettier, and more convenient (so it seems to me), that I did not think they would ever be discarded; but I am told now everybody is getting rid of them, no matter how good a table and how much it cost. Square tables are all the fashion, and we must be up with the fashion or we can not sleep. A few days ago a good friend of mine said something like this:

"Mr. Root, there are a lot of people in our town who live and think of nothing but keeping up with the city fashions, or, at least, getting as near to the city style as they possibly can, and these very people *can not afford it.*"

A great many times the people who can not afford it, or who ought not to afford it, are discarding old things that are good and serviceable because the style is changed. I thought once I would say something about women's dresses and the big sleeves; but I might make a blunder if I should undertake to do so. I think I heard somebody say the cloth in some of the big sleeves would make a very pretty dress for a little girl; but may be the statement was an exaggeration. Just one more point: □

I am pained many times nowadays by seeing children supplied with so many nice toys at such low prices. You may smile at this, for The A. I. Root Co. has dealt in toys quite a little, and the catalogs have perhaps urged the people to buy them. Well, I have felt bad sometimes to read our own catalogs—not that there is anything in them that is positively bad, perhaps, but they have reminded me of the time when my good father used to whittle out (for quite a family) our sleds and wagons winter evenings. Oh how we did used to enjoy seeing him cut things out of pine, and build

beautiful structures with that sharp knife of his in just one long winter evening! We boys coveted that sharp knife and the soft pine wood he whittled so beautifully! Why, even the colled-up shavings that he made were handsome, and we boys tried *hard* to whittle out something as nice as the one that "pa made." My older brother became very expert in this work. I remember his making about the handsomest sled I ever saw, out of some hard seasoned ash. Fifty years ago the *ingenuity* of the boys and girls was called forth in the effort to make their own things; but now we get them ready made by machinery for only a nickel. They cost so little that, if a toy gets out of order, it is thrown into the back yard, or stored away in the corncrib I have been speaking of. No one tries to mend it, as it costs so little; and even the farmers who sell their corn at 10 and 15 cts. a bushel must supply nickels for toys, or rides on electric cars, or for the "slot-machines," and for all else that is going on, or else they will not be "in fashion." I have heard statements at our farmers' institutes to the effect that the farmer is entitled to the best of every thing in the land; he should have as many books and papers, and as nice a parlor, as the banker and storekeeper in the town. Had the speaker added, "If he can afford it," I do not know but I should have said all right. But the idea that some agricultural papers have advanced, or the way the idea was advanced, that the farmer is entitled to these things, even if it requires a mortgage on his farm, it seems to me is a terrible error.

Now dear friends, I fear that we are all more or less guilty. I am afraid that we who live in the country, and raise garden-stuff for a living, are somewhat to blame for the extravagant appropriations that are being made at our state-houses or court-houses in order that we may get even with our rivals in other States or counties in fine buildings. Progress and improvement are good things. But there are thousands of other things vastly more important just now than having toothpick-toed shoes and other things to match because they are the fashion. I do not believe these things bring real happiness; and I know from experience that I feel happier and better when I rescue implements from want of care, than I do when I go and buy new things because it is less trouble than to go and fix up the old ones. *Christ Jesus* should come before fashion or any thing else that this world has to offer. Better, a thousand times better, be *out of fashion* than to be without the love of the Savior in our hearts.

#### THE DISGRACE OF THE 7<sup>TH</sup> CENTURY.

All over the land there has been a lamentation that our penitentiaries have to be built larger. Good people are also feeling sad that our prisons are mostly filled with American boys; and, at the same time, at least one State of the Union seems to think it a fine thing to encourage and develop the mania for prize-fighting. I did not intend to mention the matter at all in these pages, for many times it seems to be true that "the least said the soonest mended." As the fight is over, we might let it drop; but science has been called in to perpetuate and keep it up by degrading that beautiful new invention of Edison's to the level of making it reproduce the hideous spectacle of one human being pounding another to jelly amid the cheers of a crowd of spectators. The W. C. T. U. has, however, happily wakened, and is demanding, not only of the President of the United States, but of the governors of the various States, that the kinesiograph shall not be

paraded through the streets of our cities and villages to educate our children toward vice, as if they could not learn it fast enough through the ordinary channels. God be praised for the energetic measures started by the W. C. T. U.; and may all good people fall in line and second their efforts, whether the governors listen to our prayers or not. Keep the children away from the thing, as you would keep them out of a drunken row. I rejoice to know that Archbishop Ireland, in St. Paul, Minn., has vigorously indorsed the movement to suppress the kintoscope shows.

I can not help thinking of a little verse my mother taught me in my infancy:

Let dogs delight to bark and bite,  
For God hath made them so;  
Let bears and lions growl and fight,  
For 'tis their nature too.

But boys and girls should never let  
Their angry passions rise;  
Your little hands were never made  
To tear each other's eyes.

And these little verses remind me that our humane society, of the present age, with its efficient laws, does not always let even dogs bark and bite, and chicken-fights have been justly ruled out. What inconsistency to permit men to do so, and encourage crowds to witness the shameful scene! Can't our veteran friend Henry Berg lend a hand just in this crisis? If he is gone, where has his mantle fallen?

#### MORE ABOUT CIGARETTES.

The following clipping has been sent in:

There is scarcely a high school, academy, or college in the land where students are not dropping out of their classes, and failing to graduate, from cigarette (physical and mental) disintegration. Their names are legion, and they are pouring into the lunatic-asylums of all these lands, and committing suicide every hour of the day.

#### THE WORK OF THE ANTI-SALOON LEAGUE.

We clip the following from a Cleveland daily:

- LEIPSIK, O., March 23.—The town council last evening passed, upon the third reading, the screen ordinance by a unanimous vote of those present, it thereby becoming a law. The saloon-keepers are loud in their denouncement of the members of the Anti-saloon League. The ordinance virtually means the killing of the saloon business in this town.

It may be necessary to explain to some of our readers that the above alludes to the screens placed in front of the windows of every saloon; and I suppose it is true that the saloon-keeper's business would be ruined by letting God's daylight shine in upon him and his customers.

#### THE GOVERNMENT DISTRIBUTION OF FREE SEEDS.

With the stir that is being made in this matter it looks as if this blundering waste of the people's money would soon be abated. It has been pronounced a humbug and swindle again and again, and Secretary Morton certainly did all in his power to have it stopped; but, notwithstanding, a million of dollars or more is to be fooled away again this present season. Farmers are taxed to support this stupendous fraud, and then in return some of them get

bundles of seeds they did not order and did not want. So far as I can find, nobody is in favor of it except public officials who want the seeds to give away in order that they may make friends among their immediate constituents. Of course, there has been a reform in purchasing the seeds of prominent seedsmen; but even the seedsmen who receive the government contract condemn the principle openly through our periodicals.

#### THE OHIO EXPERIMENT-STATION REPORT ON POTATOES FOR 1896.

Bulletin No. 76, devoted entirely to potatoes, is of more than usual interest and value. Prof. W. J. Green seems to have a faculty of making every thing exceedingly plain that they have learned by their numerous tests. After reading every word of the bulletin I turned back and read many passages over and over. The summary is especially helpful. In fact, I have deemed it worthy of a place in our pages as below.

#### SUMMARY OF EXPERIMENTS WITH POTATOES AT THE OHIO EXPERIMENT STATION.

Changing seed potatoes for the purpose of securing those grown on a different soil may be advantageous, and it may not. More depends upon the selection and keeping of seed than changing from one soil to another.

Changing for the purpose of securing an improved variety is also uncertain as to results. "New blood" does not necessarily indicate an improvement, for as a matter of fact many of the new varieties are inferior to the old.

Keeping seed potatoes so as to preserve their vitality is of the utmost importance. This can be done fairly well by pitting; but cold storage, when the temperature is held at about 35 degrees Fah., is the ideal method.

Cold-storage potatoes make a quick, vigorous growth, and give a perfect stand in the field.

A storage room for potatoes need not necessarily be cool with ice, as ventilation answers very well; but with ice the temperature may be controlled at all seasons.

A good crop of potatoes may be secured if planting is delayed until the first of July, providing the seed is kept proper y.

As between budding or sprouting the seed in the light, and cold-storage, there is but little choice.

Budding is accomplished by spreading the potatoes, one layer deep, on the barn floor, on a loft, or in shallow boxes, where they get light, but are not exposed to direct sunlight. This is done several weeks before the time of planting.

Potatoes treated in this manner come up in about one week, and grow with astonishing rapidity. Cold-storage potatoes are a few days later in coming up, but mature at the same time.

Contrary to expectations, the best results have been secured in using medium and late varieties for late planting.

Usually, as large a crop is not secured by late as by early planting; but the advantages lie in being able to follow early crops in this manner, and in securing better seed, because of the superior keeping qualities of late grown potatoes.

It has been found advantageous to immerse seed potatoes not more than an hour in the corrosive-sublime solution, in the treatment to prevent potato scab.

Seed potatoes, grown from treated seed, and planted on land free from scab, may produce tubers almost free from scab.

The treatment for potato scab does little or no good if the potatoes are planted on land infested with scab.

It is a good plan to treat seed potatoes some time before planting, and to dry before storing.

Spraying to prevent potato blight has given variable results, possibly because the same forms of blight have not been present at all times.

Potatoes appearing to be sound, but showing a dark ring when cut across the stem end, are diseased, and will carry the blight to the field. The Colorado potato-beetle, blister and flea beetles, may carry the disease from one hill to another.

It is essential to reject diseased tubers, to keep the "bugs" in check, and to plant on ground where

potatoes have not been grown for a year or two. In spraying, six ounces of Paris green should be used to a barrel of Bordeaux mixture.

Thorough cultivation is important, so as to prevent the waste of moisture, and to keep up a vigorous growth, as a means of rendering the plants somewhat resistant to blight.

The most promising of the new early varieties are, Burr's No. 1, Bovee, Early Michigan, Early Thoroughbred, and VanOrman's No. 99.

The most promising of the new late varieties are, Carman No. 3, Country Gentleman, Enormous, Plague, Livingston, Table King, Uncle Sam, and Wise. White Early Ohio, Pride of the South, and White Bliss Triumph are valuable for certain sections and for special purposes, but not for general cultivation.

American Wonder, Carman Nos. 1 and 3, Early Northern, Early Harvest, Rural New-Yorker No. 2, Sir William, and Wise, have been tested sufficiently to warrant recommending them for general cultivation.

Superphosphate has increased the potato crop, in our experiments, to a profitable extent, the cost per bushel of increase being five to six cents.

There does not appear to be much difference in the efficiency of dissolved bone black and acid phosphate, but slag phosphate has given lower average results than the other forms.

Wheat bran has given better results than linseed meal.

Nitrate of soda and muriate of potash, when used singly, have not given much increase.

Superphosphate, nitrate of soda, and muriate of potash in combination have given better results than either alone, and the crop increase has been nearly in proportion to the quantity used, up to 1100 pounds per acre.

In regard to the varieties in addition to what appears in the above summary, they give Manum's Enormous a very excellent report; also Maule's Thoroughbred. I am a little surprised that they do not give the White Bliss Triumph a better report, both in regard to earliness and large yield.

Perhaps many of our readers have noticed the tremendous claims made by Salser in regard to his wonderful potatoes. The experiment station expresses the same opinion as last year—that Salser's Earliest is the well known Red Bliss Triumph that is sold all over the country as the standard early potato shipped in from the South. His Harvest King they can not distinguish from the Rural New Yorker; and the King of the Earliest, so far as they can tell, is identical with the old Early Ohio, and so on. This puffing well-known varieties under a new name in order to get extravagant prices should be vigorously shown up wherever it occurs. The Sir William receives again the hearty commendation that it received a year ago.

#### MEADOW-MICE GIRDLING THE TREES.

We have been in the habit of mulching the ground around our apple-trees so as to keep down grass, with all sorts of trash that has accumulated from the garden. I have, however, often cautioned the men about placing the stuff close up to the trunk of the tree in winter time. One man disobeyed my orders, and the result was that the finest Gravenstein tree in my orchard was completely girdled for more than a foot. The mice burrowed down into the ground, and even girdled the roots where they started out. Several other trees were injured more or less. Where completely girdled we inserted cions that reached from the bark on the roots up to the bark above, putting twenty of these in the Gravenstein tree. Why, I would hardly spare that tree for a five-dollar bill. After the cions were put in, every thing was well covered with grafting-wax, and we are watching anxiously to see the buds start out. I know it was meadow-mice that did the business, for we found four of them right at it.

They were dug out and killed. Now, please remember that, while mulching is a splendid thing around young trees, it is dangerous business to put it right up against the tree.

#### APPLE-TREE BORERS, ETC.

Perhaps the worst enemy to fruit-growing we have here in Northern Ohio is the borer. In our own orchard it had killed several trees and just riddled others before I woke up to know what was going on. For the past two or three years I have been scanning the agricultural papers, and books on pomology, to learn if there were a better remedy than digging them out of their holes, but there seems to be no help. Putting strong ashes around the trees, and washing the trunk and exposed roots with strong soapsuds may do very well, but you ought to dig them out, even if you do this. There are several substances that will kill the borer, but they will also kill the tree. In some recent investigations I found I could push a slender copper wire into their channels half way through the body of the tree, and sometimes to the depth of three or four inches. With a little practice you can tell when the point of the wire touches the borer. Of course, you are to punch him up until he is unfit for further mischief. Mr. E. C. Green, formerly of the Ohio Experiment Station, was talking with me about it, and we thought of bisulphide of carbon; but he said he would not dare to use it without first getting Prof. Webster's opinion in regard to it. I wrote him, and here is his reply:

In regard to the use of bisulphide of carbon for borers, I would say that there might be some danger in injecting the fluid into the chambers made by the borers; but if cotton were saturated, and this placed in the cavities, so that only the fumes would spread, I think no ill effects would follow. Any other substance that would prevent the fluid from running into the wood would be effective, as the fumes are as deadly as the fluid itself.

WOOSTER, O., Mar. 18.

F. M. WEBSTER.

Now, if anybody else knows any thing about the use of bisulphide of carbon for this business, will he please tell us about it? It may not do harm to inject it into the holes made by the borer; but to fill a cavity that extends into the heart of the tree, and runs downward several inches, might kill the tree; that is, the liquid might do so, but I am sure the fumes applied on cotton, as above, would not. Bear in mind, the fumes of this liquid are so much heavier than air that they will run down almost like water.

This same borer, or at least a similar one, has blocked all my attempts thus far at growing peaches. Where they dig in close to the root of a peach-tree, great quantities of peach-gum ooze out, and the tree is soon used up.

#### THE LOGAN BERRY, OR RASPBERRY-BLACK-BERRY.

In answer to my request in our last issue, we have the following from friend Gault:

I must say that they have fully come up to my expectation. The clusters were not as large as shown in the catalogs; but the berries were large and of good flavor.

I am exceedingly glad to receive this good report; but I wish that friend Gault had taken a little more space to tell how long he had had the Logan berry before it fruited. My impression is, he procured one of the first offered for sale as I did; and his experience with the celebrated Gault raspberry probably enabled him to secure a better result. This beautiful weather the latter part of March has started the buds on my own plants, so that we have some hopes of getting some fruit this year.

Since receiving the above we have had a

very pleasant visit from Mr. L. B. Pierce, the well-known agricultural writer, and he says the Logan berries at friend Gault's were about the prettiest berries he ever saw in his life, and thinks the plant is destined to be an acquisition.

#### SWEET CLOVER.

In Bulletin No. 70, from our Ohio Experiment Station, subject "Forage Crops," we find the following:

As a forage crop for feeding or for hay, we have not found it of any special value, our cows and horses having refused to eat it either green or dried.

This to me is simply astounding. I can understand why cows and horses should be suspicious of it when it is offered them for the first time; but I can not understand how any cow or horse should refuse to eat it after having once had a taste of it when it is young and tender, say a foot or two in height. Inasmuch as the State of Ohio once called sweet clover a "noxious weed," this becomes an important matter. Our horses will eagerly grab for sweet clover in preference to any other green stuff that can be given them; and they will eat it cured as hay, and grab for the dried branches that have ripened seed. In my travels I have watched anxiously to see if I could find a bit of sweet clover in any field where horses and cattle were pastured, but I have never found it. I have also watched to see if I could find it along the roadside where horses or cattle were permitted to feed, and I have never seen that. I wish our readers would give us quite a lot of postal-card experiences. I say "postal-card," because if you write a long letter we can not publish a large number of them. We want reports from different localities. Let us settle this question if we can: Is sweet clover of value, both green and dry, as feed for stock, or is it not?

#### YELLOW AND WHITE SWEET CLOVER.

Of late we are having quite a few inquiries for both kinds of sweet clover—that is, somebody wants a package of the kind producing yellow and also a package of the other kind producing white blossoms. Now, my experience is that the color of the blossom indicates no difference at all in the plant. A great many times I have seen among the sweet clover a single stalk producing yellow flowers instead of white, but I have always regarded this as a sort of sport or accident, as it were. If I am wrong I shall be glad to be corrected. So far as I know it is one and the same plant that produces the white or yellow blossom. We find this peculiarity in other plants. In a row of red-pepper plants there will frequently be one producing yellow papers, and *vice versa*.

#### POTATO-TOPS FOR MULCHING STRAWBERRIES.

Once more I can say, as I said a year ago, that the best mulching I have ever got hold of for strawberries is potato-tops—especially the tops of the new Craig, because there are so many of them and they are so long. First, all of our strawberries covered with potato-tops are bright and green. Not a leaf is frosted or rotted or wilted, and not a plant is pulled out of the ground. You can look down through the tops and see them as green and fresh as they were last fall. Second, although the potato-tops are so light and loose, they are never blown off by the wind. Third, there are absolutely no weed seeds among them. Where we used strawy manure, with the great amount of wet warm weather we had during the past season, the strawberry leaves are more or less moldered and rotted. Of course, the plants are alive, and are going to start; but they will not compare with those under the potato-vine

mulching. Again, where we use straw or strawy manure, there will be more or less weed seeds or seeds of grain, and the latter is about as bad. Finally, the berries will grow right up through the potato-vines, which, by fruiting time, will become packed down so as to be the nicest thing in the world to keep the fruit out of the dirt. Now, remember, when you dig your potatoes, carefully remove the vines and stack them up out of the way until your strawberries are frozen up the first time, then spread your potato-tops along over the plants so as to lie up from eight inches to a foot high. You can see the plants down through the beds by looking closely, and the plants can look out and see the stars all winter long. The vines hold the snow, and they shade the ground sufficiently to prevent the injurious alternate freezing and thawing. Tomato-vines seem to answer much the same purpose; but they are almost too coarse, and do not lie in place as well. Besides, they are not as plentiful.

Oh, dear me! I almost forgot to say that you must keep your potatoes absolutely free from weeds. Weeds that have gone to seed, mixed in with the potato-vines, would not, of course, be allowable under any circumstances.

Since the above was in print I find I am not entirely original in my discovery. We clip the following from *Vick's Magazine* for March, in regard to mulching strawberries:

"We always liked the plan of the old farmer who grew potatoes largely, and who every year drew and spread a good-sized load of potato-tops over his strawberry patch. The potato-top is richer in potash than much barnyard manure, and the winter's freezing and thawing reduces its bulk into fine mold. It has no weed seeds, which is more than can be said of most stable manure. It protects the plants just when it is most needed, which is through the coldest weather, disappearing when spring opens, and when the plants require all the sunshine they can get.

#### THE WAY IN WHICH THEY MANAGE TO BREED UP SUGAR BEETS SO FAST TOGETHER THOSE SHOWING THE LARGEST AMOUNT OF SUGAR.

We extract the following from Bulletin No. 75, on beet-sugar production, from the Ohio Experiment Station:

"Plugs are taken from roots having the desired form and size in such a way as not to injure them seriously, and the juice of these plugs is analyzed to determine the sugar. Those which are satisfactory are planted the following spring to produce seed. The seed thus secured is planted and the beets resulting are again analyzed, as before, and only the best chosen. This process is repeated for several years, when, finally, all of the seed grown is turned over to the farmers for producing beets to be consumed by the factory. The beet roots so carefully selected for seed are called "mother beets." Millions of dollars, literally, have been expended in scientific studies of the beet root, with the wonderful results above noted. All of this care and selection results in making the beet-root one of the most artificial of plants, and it responds immediately to abuse by yielding less sugar, or under good culture, by holding its sugar content up to the high standard set for it.

"In the time of Napoleon Bonaparte they thought they had accomplished considerable when they had beet juice that was 6 per cent sugar; "now whole fields of beets are grown which carry 14 per cent of sugar in the juice; while single specimens have yielded 20 and 25 per cent of sugar." It was by breeding up in this way that the Kleinwanzleben model sugar beet has been produced. The sugar-beet belt, as it may be called, that is specially adapted to the growing of sugar beets runs through Wisconsin and along through Northern Ohio south of Lake Erie. This belt is practically 100 miles

wide. The town of Hudson, O., is said to be not far from the center of it, and it extends indefinitely both east and west.

#### THE NEW QUEEN AS AN EARLY POTATO.

Last year we had such a quantity of New Queens that we took no particular pains to test their earliness with other early potatoes; but we had one planting where the New Queens produced potatoes big enough to eat (and a large yield at that), in a shorter time, it seems to me, than any other potato we ever planted. In making out our list I felt inclined to put it among the extra-earlies, but finally did not do so. Since then I find the following in a recent issue of the *Rural New-Yorker*:

Mr. Albert Emerson, of Danville, Ill., tells the writer of these notes that he found the New Queen potato 10 days earlier than Early Ohio. Both were planted April 7, and the Queens were dug June 11, yielding about 300 bushels to the acre, twice as much as the Ohio. Both kinds were treated in precisely the same way. We're glad to receive such reports. They aid our readers in making selections.

Now, then, why not use the New Queen for an extra-early potato for market? In consideration of the quantity we have on hand, we offer them lower than any other potato in our list; and as they are now thoroughly disseminated, other dealers are offering them at like low prices.

#### THE DIFFERENT SPECIES OF SWEET CLOVER.

By your seed-list I suppose the *carulea*, or bee clover, is not known by you to belong to the *melilot*. Here is its botanical position:

*Melilot officinalis* (yellow), a native of Europe. A water is distilled from the blossoms that is used in perfumery.

*Melilot vulgaris* (or *leucantha*). This is a white *melilot*. It is the one you call *M. alba*, which is incorrect; also the name, Bokhara, is incorrect, as my description later on will show.

*Melilot carulea* (blue). This is the *carulea* of Europe, particularly of Switzerland and the Tyrol. This has the *melilot* odor in a high degree, and was much used formerly in medicine as a discutient, sudorific, expectorant, and vulnerary; also the many good qualities of the Schatzliger cheese are supposed to be due to this *melilot*, to which it is supposed to owe some of its flavor.

*Melilot arborea* (Bokhara). Valuable in some remote parts for its fiber only, which is supposed to be closely allied to hemp in quality.

*Melilot missimensis*. A native of the locality near the Mediterranean Sea, and by the native ancients given the name of "*Lotus*," whence the latter part of the name *melilotus* is derived.

The foregoing information may be new to you, and it may not. Gray's Manual does not thus classify the *melilotus*, nor do any of our former botanical works. It is classified thus only by our most classical works. However, I believe this to be a correct classification. The only thing that I should like to suggest is, could not the *carulea* be cultivated and eventually become acclimated to grow spontaneously like our common white clover?

Reading, Pa.

L. L. ESENHOWER.

My good friend, I am exceedingly obliged for the facts you give us; but how is it that we find stalks of sweet clover bearing yellow blossoms scattered through our white sweet clover? Is not the difference only in color of the bloom? In regard to Bokhara, we first purchased our Bokhara seed of D. A. Jones, of Canada. When planted side by side with our own sweet clover no one could tell a particle of difference. I wrote him about it, and he said there was no difference, only that seedsmen generally called the hulled sweet clover Bokhara. Now, in order to settle this I should like to have a little bud of all the five kinds you mention, side by side. We already have the first three, if I am correct. Can you supply the last two? I shall be specially glad to get the real Bokhara. We

have always made Gray's Manual our standard; and if that is incorrect, as I take it from what you say, I am afraid that at least a good many of us will have to go wrong.

#### MORE ABOUT THE CRANDALL CURRANT.

It gives me great pleasure to give place to the following:

Mr. A. I. Root:—I have some Crandall currants, but mine bore very well. They were so full that I had to prop them. They were not as big as yours, except where one was by itself. I planted these in a rather low moist place. I had some on high dry ground that did not do so well. They are easy to raise, and sprout a great deal. No insect seems to harm them. I send you a few plants, and you can try how they do.

H. L. WISE.

Berkeley Springs, W. Va., Mar. 22.

#### THE BUNCH YAM SWEET POTATO.

I presume most of our readers noticed the spread-eagle advertisements that appeared in most of the agricultural papers last year, of the new sweet potato called Goldcoin. The claims made for it were in the most extravagant language, to the effect that nothing like it had ever been seen or tasted since the world began, etc. I felt satisfied at the time that it was a swindle, but we could not just prove it. The sequel finally appears in a circular just at hand:

Last year a prominent seed-house contracted for all the stock I had to sell, and requested me to christen the improved strain with a new name, which I did, viz., Goldcoin Vineless. They advertised them extensively, and got a great many orders, I am told; but what kind of potatoes their patrons were supplied with I am not able to say, as they got but very few from me, and never paid me for what they did get.

W. T. SIMPSON.

Pine Bluff, Ark.

It is just as I expected. They had the comparatively well-known bunch yam, and nothing else. But they did not get rich at the business after all. So far as I can learn, there are just two vineless sweet potatoes or yams before the people, and each one of them has about half a dozen different names. The bunch yam is different in vine and different in foliage, and stands almost straight up until along late in the season. The other kind—the vineless sweet potato, called "General Grant" for short—has a leaf like the ordinary sweet potato, and with us, the latter part of the season, it makes considerable of a vine. Now, something should be done about confusing the agricultural world with any more names. If I have not got the names right, or the best ones, I am willing to be set right. One enterprising advertiser calls his the "McKinley" bunch sweet potato. I don't know but we shall have to call on the experiment stations or the authorities at Washington to give us the proper names of these new things, and then expose attempted frauds in that direction. We have already prepared printed sticks for the two different kinds, labeled respectively as follows:

Gen. Grant, or Vineless Sweet Potato  
Bunch (or "Vineless") Yam.

#### MARCH'S STRAIN OF SNOWBALL CAULIFLOWER SEED.

We have just received 1 lb. of seed from the grower, and the following statement in regard to it:

We send this time extra stock, picked heads, Puget Sound Snowball. We guarantee 98% to make perfect heads.

H. A. MARCH.

Just a word in regard to growing cauliflower. We make our first sowing of seed in the greenhouse in January; then we sow some more every two or three weeks, clear along until somewhere about June 1st. The first and last

sowings make altogether the nicest heads, for it is a hard matter to grow good cauliflower during hot weather. Plenty of water during a dry time helps the matter very much; but as for myself I never succeed very well unless the weather is cool. Cauliflower will stand a tremendous amount of cold, especially in the fall. In the spring we often have to sell nice heads at the same price as early cabbage. People won't give any more for it; and if it were not for the expense of the seed we could raise it about as cheaply by the pound; but in the fall, when it comes time to make pickles, there is often a great demand for it, and none to be had. We have seen women try to buy specimens on exhibition at our county fairs, and they offered big prices for it; but nobody had any to sell. You want to have it head up so late that there will be no trouble from insects, and no trouble from the hot sun. Then you can get great handsome heads; and those that peep up through their beautiful green petals are veritable "snowballs" indeed. Do not sow your seed all at once. Put in a little at stated periods as mentioned; and if you fail with one lot you will probably succeed with some of the others. Of course, we sell a very small package for 5 cts.; but if you are going to make several sowings you had better have  $\frac{3}{8}$  or  $\frac{1}{4}$  ounce; price, respectively, 25 and 40 cents.

#### GRAND RAPIDS LETTUCE.

□ We are pleased to note that the low-priced seed offered at 50 cts. per lb. gives just as good plants, and as good a crop, as that which we formerly sold at \$1.50. This is indeed good news to those who are obliged to purchase seeds. The low-priced seed is, we are told, grown in California, where they have long seasons, and ground specially suitable. Well, the friends who have been making a good thing growing lettuce under glass will discover that, at about this season of the year, the hot sun is liable to turn the lettuce a darker green, and make it tough. Lettuce, like celery, should be white and crisp. Perhaps you remember I told you a year ago about shading the crop from the sun. Shutters instead of sashes will do it nicely, but they must not be kept on too long or the lettuce will get so white and delicate that it will wilt down when the sun touches it; and about the very best thing to keep it just right is the cloth covering. The cotton sheeting to roll up on a pole, such as is described in the tomato book, is just the thing. Now, look out and do not lose your nice trade in Grand Rapids lettuce because you let it get too much hot sun. If the weather is cloudy, it is not so much matter; but do not let the sun turn it to a dark green and make it tough.

#### HOLLAND OR DANISH CABBAGE SEED.

Perhaps the friends have noticed that the finest cabbage on the market—in fact, the only real nice cabbage on the market for nearly two months past—has been the imported kind. It is quoted now at from 1½ to 1¾ cts. per lb., wholesale. We retail it on the wagon at 2½ to 3 cts., according to quality. Year after year the Hollanders succeed in getting nicer hard cabbage than any thing we can grow in the United States. What is the trouble? Is it their superior soil and mode of culture, or is it their superior strain of seed? About ten years ago a correspondent of GLEANINGS in Holland, or somewhere over that way, sent me a paper of cabbage seed, and told me to plant it by the side of our best American strains, and let him know the result. The seed was of larger size than our cabbage seed; the plants had a rank, strong growth that I had never seen then and have not seen since. They seem to stand light freezes better than our own, and they made the

finest cabbage I ever raised in my life. In fact, you can find a picture of a load of them in the back part of our book entitled Winter Care of Horses and Cattle. But let us now get back to the seed. I have been to considerable expense to obtain a limited quantity, which I am assured is the seed that produces the nice hard cabbage to be found now in our city markets. I allude to the imported cabbage. If you want some of the seed we can furnish it in five-cent packages or for 20 cts. per ounce, or \$3 per lb. I do not know whether this seed came directly from Holland or not; but if we have a subscriber to GLEANINGS anywhere in the Old World, where this hard firm cabbage is grown, that will keep clear up into the winter and even into March, without a bit of trouble, I wish he would send me some more seed, and give me an invitation to go over there and learn how to raise Holland cabbage. I have long been wanting to take a trip where high-pressure gardening is the rule every day in the week, and where they have great windmills, not to pump the water on to the gardens, as we do, but to pump it off.

---

#### MONEY LOST IN THE MAILS—WHO SHALL STAND IT?

On page 655 of our issue for Sept. 1, 1896, I published a part of the correspondence of S. S. Meeks, of Meeks, Ga., omitting the name of the writer, and substituting X Y Z. Since that time we have had more or less correspondence, but have not succeeded in getting even one copper for the three smokers we sent Mr. Meeks—not even the 30 cts. in stamps that we paid out to get them to him. He finally said he would stand a part of the loss if we would give him legal proof that the money he sent never reached our office. In reply to this we sent him an affidavit, sworn to by my daughter and Mrs. Root's sister—these two women being the only ones at the time who opened the letters sent us. We claimed that, inasmuch as he sent the \$1.80 mailed in a common letter (contrary to our directions for sending money to us), he should be the loser for at least a part of the amount. Thus far he stoutly declines to stand even a part of the loss. In our directions for sending money, which are on the back of every order-sheet, and which order-sheet Mr. Meeks acknowledges he had before him when he sent the money, we say:

If there is no bank, express office, or money-order office near you, so that you can not use any of the above methods, you may send by registered letter, and we will be responsible; but if any of the methods first named are available, we will not be responsible for money sent in any other way.

Notwithstanding the above, he put the \$1.80 in a common letter. When he wrote, complaining that he had not received the smokers, telling us the circumstances, we felt so sorry for his loss, and thinking the use of them might be worth more to him than the value of them, we sent them right along.

---

#### CRACKED WHEAT AND CRACKED RYE.

Dr. Mayer, in his excellent work "Domestic Economy," gives substantially all I have mentioned in regard to the use of cracked wheat for constipation. Furthermore, he says for obstinate cases substitute rye in place of the wheat. We have been using it for a week or two past, and find that it not only does all he says, but that it is a most luscious article of food. Get some nice rye, and have it ground and cooked exactly as described on page 170, March 1.

## A Dollar Saved

is better than one earned. Read my 37th annual catalog, and don't send out West for goods you can buy cheaper here at home.

I have added 2400 feet of floor-space to my store house and shall keep in stock Root's polished one-piece sections, Dovetailed hives, new Weed foundation, etc., in addition to my old line.

Best breeds of bees and queens at bottom prices. Don't buy until you see what you can do with me.

W. W. CARY, Colrain, Mass.

## Our Prices are Worth Looking at!

IN THE

New Champion Chaff Hive Especially.

All other supplies accordingly. Send for catalogue and price list. Address, mentioning GLEANINGS,

R. H. SCHMIDT & CO., Box 187, Sheboygan, Wis.

SQUARE GLASS HONEY-JARS,  
ROOT'S GOODS AT ROOT'S PRICES,**

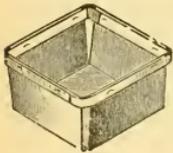

Bee-keepers' Supplies in general, etc., etc. Send for our new catalog. "Practical Hints" will be mailed for 10c in stamps. Apply to

CHAS. F. MUTH & SON, Cincinnati, O.

## Fruit Packages of all Kinds,

Also

Bee-keepers' Supplies.

We allow a liberal discount on early orders. Why not send for your supplies now to save the discount and avoid the rush of the busy season? Catalogue and price list free. Address

BERLIN FRUIT-BOX CO.,  
Berlin Heights, Erie Co., Ohio.

## It is here.

The year 1897 is here, and we are happy to inform our friends and customers that we are now better prepared than ever before to fill your orders for queens and bees. We have the largest stock ever operated by us, and we mean to be ready with plenty of bees and queens to fill all orders without delay that are sent to us.

Bees by the pound, \$1.00; ten or more pounds, 90c each. Untested queens for 1897, \$1.00 each in February, March, April, and May; \$5.00 for six, or \$9.00 per dozen. For larger amounts write for prices. Have your orders booked for your early queens. Safe arrival guaranteed.

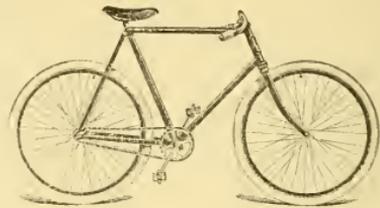

Root's goods, Dadant's foundation, and Bingham smokers. A steam bee-hive factory, and all kinds of bee supplies.

The *Southland Queen*, the only bee-paper in the South, monthly, \$1.00 per year

Send for catalog, which is almost a complete book on Southern bee-keeping, giving queen-rearing in full, all free for the asking. If you want full information about every thing we have, and the bee-book, don't fail to ask for our 1897 catalog.

The Jennie Atchley Co.,  
Beaville, Bee Co., Texas.

1897.

## Cleveland Bicycles.

Every piece and part of the Cleveland Bicycle is made in our own factories by the best of skilled workmen, under most rigid inspection. The result is a Bicycle embodying, in a marked degree, features of safety, speed, and durability.

THERE'S HONEST VALUE IN IT.

We want the patronage of intelligent and discriminating buyers. 1897 catalog mailed free for the asking.

H. A. LOZIER & CO.,

Cleveland, Ohio,

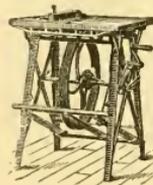

Send 4 cents postage for our booklet, "Shake-speare and the Bicycle." Two've illustrations in colors by F. Opper, of "Puck."

## BUGGIES,

Carts, Surries, Phaetons, Spring Wagons, Harness and Saddles shipped C. O. D. anywhere to anyone with privilege to examine at lowest wholesale prices. Guaranteed as represented or money refunded. Send for illustrated catalog and testimonials free. Addr. (in full)

# A BICYCLE TOUR

Three gentlemen for a European tour purchased new hundred dollar bicycles. One a Columbia—the others of well-known high-grade manufacture. They had an agreeable trip—particularly the Columbia rider. Before returning to America, it being late in the year—and wishing to buy new machines in 1897—they sold their wheels to a London dealer. The Columbia bicycle brought \$65.00. The others \$40.00 and \$35.00 respectively. But one of the many proofs of Columbia superiority. If you look a year ahead there is wise economy in

*Columbia*  
Bicycles

HANDSOME ILLUSTRATED CATALOGUE ADDRESS—FREE!

515 OHIO ST. QUINCY ILL.

In writing advertisers please mention GLEANINGS.

G. B. LEWIS CO.

A change in the advertisement of this firm, received too late for this issue, announces that E. T. Abbott, of St. Joseph, Mo., is their special agent for the Southwest, and sells their hives and sections at factory prices.

## BEEWAX MARKET.

There is very little change in the beeswax market. Values are a trifle higher, so that we will now pay 25 cents cash, 27 cents in trade, for average wax delivered here. We have stock enough for two months, but we can use all we get, as we are working up over a ton a week. We do not look for any higher prices this spring, as there is considerable stock in the hands of brokers.

## QUINBY BEE-SMOKERS.

We do not catalog the Quinby smoker this year, but there may be some who prefer this style. We still have a few in stock here and in Chicago, which we offer at special prices to close out. The 2-inch single-blast we offer with other goods at 35 cents each; by mail, 50 cents, postpaid. These go from Chicago only. A few 2½-inch double-blast at 60 cents each, or by mail at 75 cents, postpaid, from Chicago only. We have here a few 2½-inch double-blast hinge nozzle which we offer at 65 cents with other goods, or 85 cents, postpaid. Some large 3¼-inch single-blast at 90 cents each; by mail, \$1.10. One or two double-blast, 10 cents extra.

## DRAWN FOUNDATION.

As we go to press we are just getting started our latest machine for the manufacture of drawn foundation, sometimes called deep-cell foundation. Mr. Weed, with one or more assistants, has been hard at work on this machine for several months; and when finished it is designed to make pieces 5x8 inches in size. We were in hopes to have it finished and tested sufficiently to warrant putting a price on sample lots of the product in this issue; but for the present we will agree only to book orders for our 5-cent sample package, and for a 25-cent package, which will include 6 pieces 2x4 inches, put up in a 4¼ section, mailed in a carton, and sent postpaid for 25 cents in stamps.

## HONEY MARKET.

The Cleveland market seems to be bare of choice white comb honey. We know of several places where it could be placed at fair prices, if there is any to be had. Dark or off grade honey can hardly be disposed of in this market at any price. Those who have choice white comb honey still on hand will do well to write us, with description of honey, size and style of packages, quantity you have, and price you hold it at.

Of extracted honey we offer choice Wisconsin clover and basswood in 60-lb. cans, 2 in a case, at 7 cts. a lb. We can also supply it in one-gallon cans, 8 in a case, at \$6.50 per case; 2-case lots at \$6.25; 5-case lots at \$6.00, which is 75 cts. per gallon—a low price for such nice honey. It has been liquefied.

## BUSINESS AT THIS DATE.

We are well up on small orders, which, with a few exceptions, where something special is required, are shipped within three or four days after being received. Occasionally orders are delayed a few days waiting for stock to arrive. We are not quite so prompt on carload shipments, as we have gotten behind on these, and seem unable to catch up. Since our last we have shipped a car to Mechanic Falls, Me., where J. B. Mason has charge of our Northeastern Branch. Another car has gone to St. Paul, Minn., to our Northwestern Branch, where H. F. Acklin has charge at 1024 Miss St. Another car has gone to the Chicago Branch, 118 Mich. St. We have shipped a second car to Jos. Nyswander, Des Moines, Iowa. A car has also been made up and shipped to Salt Lake City, Utah, where Juo. H. Back, 235 West Third North St., has our goods for sale. We are loading a second car for Geo. E. Hil-

ton, Fremont, Mich., and another for M. H. Hunt, Bell Branch, Mich. We have orders booked besides for three or four cars more to go out as soon as we can get them ready.

## MAPLE SUGAR AND SYRUP.

The delicious sweets of the sugar maple are becoming plentiful in our market, and we are able to offer a choice article of this year's make at lower prices than usual. We handled last year over 15 tons of maple sugar, and upward of 1000 gallons of syrup, so we are prepared to supply it in large and small quantities. We also guarantee what we furnish to be absolutely pure maple. Choice first-run syrup, in 1-gallon cans, we offer at 90c per gallon; 5 gallons, \$4.25; 10 gallons, \$8.00; 20 gallons and upward, 75c per gallon. Good clear syrup, not first run, at 5c per gallon less.

Choice first-grade sugar, 9c per lb.; good second-grade sugar, 8c per lb.; fair third-grade sugar, 7c per lb.; 50-lb. lots, ½c per lb. less; barrel lots of 300 lbs., 1c per lb. less. Your orders will receive prompt attention.

## SECOND-HAND FOUNDATION-MILLS.

We now have on hand the following second-hand foundation-machines, which we offer at the special prices annexed:

One 6-inch hex. No. 1390. Price \$6.00. This is one of our late style of mills, which has been used by a large manufacturer, and traded back for a new one. It is in fair order, and will still make good thin foundation 10 feet to pound. One leg was broken in shipment, but, fortunately, on the end opposite the crank, so that this hurts it little for use if screwed down to bench. Good value for the price.

One 6-inch Pelham, No. Y.Y. Price \$4.00. If wax is sheeted the proper thickness for the grade of foundation wanted, this will make foundation which will be much better than nothing, and at the price it should serve some one a good turn.

One 10-inch round-cell, No. 1505. Price \$18.00. This is one of our late style of mills, and is practically new, having been used almost none, and it is a bargain at the price.

One 10-inch round-cell, No. 1794. Price \$12.00. Suitable for medium brood foundation. This mill has been used in our wax-room, and is still in good condition. Good value.

One 10-inch round-cell, No. WW. Price \$12.00. This mill is in excellent order, and cheap at the price.

One 10-inch round-cell, No. V.V. This is an old-style mill; has been used but little. While it does not compare with late make, it will answer a good purpose for those who wish to make only a limited quantity for their own use. Price \$8.00.

One 10-inch round-cell, No. XX. Price \$7.00. This is about the same as the last described—an old-style mill in fair condition.

Besides the above second-hand mills we have a few 6-inch ones; 12 inch round deep cell, and three 14-inch round-cell mills, which have never been used, which we will sell at special prices. Samples mailed to any interested.

## Special Notices in the Line of Gardening, etc.

By A. I. Root.

## ONION-SETS.

Our onion-sets are all sold out except the White Multiplier and Whittaker; and neither of these can be strictly called onion-sets. We can procure more on short notice for our friends, but not less than \$3.50 per bushel. They are getting to be scarce, and are going up rapidly. Better use onion-plants now if you fail in getting sets.

## NICE CURRANT-BUSHES AT LOW PRICES.

I take pleasure in calling attention to the Fay currant-bushes advertised in this number by Fred H. Burdett, of Clifton, N. Y. Last year one of our people picked two quarts of nice currants from one dozen of these bushes the same season they were planted. Of course, he wants more of the same kind this spring. Just think of it—five cents for a nice currant-bush that will bear a crop the year it is set out!

## BLACKWALNUTS AND HICKORYNUTS.

As we are not sold out, we thought best to remind the friends that, when ordering goods by freight, we will put you in a peck of nice hulled blackwalnuts for only 10 cts., or a peck of nice shellbark hickorynuts for only 35 cts. Of course, we can ship them by themselves if you wish, but it will hardly pay to send a peck of blackwalnuts costing only 10 cts., alone, when the freight would be considerably more than that.

## FORCING ASPARAGUS.

We are just now gathering our first crop, grown under glass without heat. The plants were put a foot apart in a bed wide enough to receive sash. They have been growing strong for two years past. The glass was first put on the bed about the first of March, and now we have beautiful sh ots 6 inches long, two or three weeks in advance of any that may be expected in the open air. This two or three weeks, however, enables us to get 40 cts. per lb. for what would otherwise have been only about 10 cts.

## YELLOW NANSEMOND, OR JERSEY SWEET POTATOES

As it is now about time to bed these for plants, we can furnish the potatoes as follows: 1 lb., by mail, 15 cts.; 1 peck, 25 cts.; ½ bushel, 40 cts.; 1 bushel, 75 cts.; barrel, \$2.25.

## EARLY PEABODY RED YAMS.

These gave such excellent satisfaction last year that we shall offer plants and potatoes for sale this season. Prices of potatoes: 1 lb., by mail, 20 cts.; 3 lbs. by mail, 50 cts.; ½ peck, 40 cts.; peck, 60 cts.; bushel, \$2.00; barrel, \$4.50.

Prices of bunch yams and vineless sweet potatoes same as Early Peabody red yams. See page 256.

## OUR SQUASH-BOXES FOR FORCING STRAWBERRIES.

The squash-box which we have several times described, with a pane of glass to slide in the top, is a splendid thing for raising choice strawberries. It gives them plenty of light, protects them entirely from the hard freezing nights in the fore part of April, and the glass need not be moved at all. So large a part of the area is shade, and so little glass, it never gets so hot at this season of the year as to injure the plants. We are using quite a number of them on choice varieties that we are very anxious to have make runners just as fast as possible.

## ONIONS AND LETTUCE DURING THE CLOSING DAYS OF MARCH.

Day before yesterday some one came over from the train, and ordered 25 lbs. of lettuce and two dozen bunches of onions; yesterday a like amount went in the same direction, and another similar order came to-day. We packed the lettuce in a new ½-bushel basket, costing 15 cents. We got for the lettuce 12½ cts. per lb., or for basket and all about \$3.00. For the onions we got 3 cts. a bunch. A bunch of onions at this season is 5 oz. Now, we did not have to peddle these things, and did not have to hunt a market. I presume some one saw our nice-looking stuff while he was passing through on the trains, so he came to us for it. When a gardener can so handle his business, and produce garden stuff so choice that people come to his place of business and take all the stuff he can raise, and carry it away, then he is right up in "high-pressure gardening"—providing, of course, he gets a price that will pay. I am quite well satisfied with the above prices. The lettuce was, of course, grown under glass, but the onions were right out in the open air, where they have stood for the past five or six years, with almost no attention at all except an annual mulching of manure.

In our sub-irrigated bed, where we had those fine strawberries a year ago, we got a basketful of lettuce (\$2.00) from under a single sash. How is that for high-pressure gardening?

## "VEGETABLES UNDER GLASS."

We are having a big demand for this little book by H. A. Dreer, and it is well that there should be. But one unfortunate part of it is, by some blunder of the writer the price as given in our seed catalog is 15 cts.—3 cts. extra for postage if sent by mail, when it should be 20 cts., and postage 3 cts. extra. Ten thousand seed catalogs were sent out before the mistake was noticed. We can not well write to our customers and tell them there was a mistake,

for only 5 cents. And then here is another dilemma: If I mention the matter here in print, it just calls attention to the fact that you can get the neat little book for 15 cents if you just send the money and don't say any thing about it. I don't see any way out unless I buy 100 at once, and by this means succeed in getting them at so low a figure that I can afford to sell them for 15 cts. Remember, if you get them at this low price you must send 5 cts. more for postage if wanted by mail. For many years we have been making a distinction in price on books between having them sent by freight or express with other goods, or postpaid by mail. It has always seemed to me unfair to charge a man the price of the book postpaid, when he does not pay any postage on it at all; and yet this is the way the greater part of the book publishers have been doing for years past. I notice also another blunder in the price of the standard work, "Gardening for Profit," by Peter Henderson. The new price of this book is \$1.35; 12 cts. for postage if wanted by mail. The price given in that unfortunate seed catalog is \$1.85. The latter is the publisher's price. The lower one is the price recently made. I suppose the reason why your old friend made so many blunders was because he was obliged to correct the seed and book catalog when he had not quite recovered from his recent attack of grip.

## TWO THOUSAND BUSHEL OF SEED POTATOES TO BE GIVEN TO OLD SUBSCRIBERS.

It looks just now as if we should have a great surplus of potatoes, as we did last year; and it we are going to be obliged to give them away we very much prefer to give them to our old subscribers, and to the patrons of GLEANINGS for years past. One or two have accused us of being more liberal to our new subscribers than to our old ones. But that is a mistake. We do not offer new subscribers any thing; but it is to our old friends who take a little pains to get GLEANINGS introduced in new localities and new families. Now, then, whoever will be the means of getting GLEANINGS started in some place where it has not been going before, may have a dollar's worth of potatoes for every dollar he sends us for a new subscriber. The person who sends us a new name must be a subscriber himself, and one who has paid up all arrears. Every one who gets a renewal, or renews himself (after paying up all arrears), can have fifty cents' worth of potatoes for every dollar he sends us. Let me now repeat, so there will be no mistake: A dollar's worth of potatoes to every one who sends a dollar for GLEANINGS, with a new name; 50 cents' worth of potatoes to every one who sends us a dollar for GLEANINGS as a renewal one full year in advance for himself or somebody else; but please take notice, if you want your potatoes sent by mail you must send at the rate of 10 cents per lb. for postage and packing. This offer refers to all the potatoes enumerated in the list below except White Bliss Triumph, Rural New-Yorker, Carman No. 3, Burpee's Extra Early, and Manum's Enormous. What stock we have left of these will probably be sold out without the necessity of giving them away.

NAME	1 lb. by mail.	3 lbs. by mail.	½ peck.	Peck.	½ bushel.	Bushel.	Barrel—11 pk.
Varieties are in order as regards time of maturing; earliest first, next earliest second, and so on.

\*50 strong eyes, by mail, postpaid, \$1.00.

We can furnish seconds of the Thoroughbred, Burpee, Freeman, New Queen, Sir William, Carman No. 1, and New Craig, at half the above prices. All the others (seconds) are sold out. Please note that this low price on seconds does not apply to potatoes sent by mail postpaid.

## KIND WORDS FROM OUR CUSTOMERS.

GLEANINGS is worth \$25 a year. Long may it live a d prosper, if you please, preaching God's word as well as that of the bees.  
T. P. MURRAY.  
Fort Collins, Colo.

I am just finishing putting up the 4-piece sections I bought of you, and will say they are the best that I have ever bought, and are away ahead of any 4-piece white-poplar sections that I have ever seen.  
Luce, Mich., Jan. 20. WM. CRAIG.

The new A B C of Bee Culture was received the 20th inst., for which I thank you very kindly. The book is worth twice the money. It is more complete than any other I ever saw.  
F. A. WADE.  
Tawas City, Mich., Mar. 22.

I am much pleased with the journal, and especially with those talks of Bro. A. I., which are so elevating in tone, so strengthening to Christians. The ten chaff hives I purchased of you about two years ago are veritable palaces, and the 8-1/2-spacers are quite perfection.  
R. C. HUGENTOBLEK.  
Miami, O., Feb. 19.

I subscribe for 34 different journals and scientific papers, but I consider GLEANINGS as among the best; but the proper appreciation of an editor's effort, I believe, is to pay the subscription; therefore find enclosed \$1.00.  
GEO. L. VINAL.  
Charlton City., Mass., Jan. 1.

### OUR SECTIONS IN ENGLAND.

Your sections and frames have given me and my customers every satisfaction, since I got them through Mr. Boxwell, of Ireland. I like GLEANINGS and its story.  
WILLIAM HOGG.  
Dalbeattie Road, Castle Douglas, Jan. 21.

Your talks on Christ, and other religious matters, are of great benefit to me, and are a help to keep me in the straight and narrow way. Cast your bread on the water, and it will return after many days with God's blessing on you and yours.  
Clove, N. Y. JAS. E. WAY.

I sold a small lot of honey that was put up in boxes which I bought of your house last year. The packages looked fine; and when filled with white comb and clear white honey, nothing could look nicer. The sale was made March 20, and I got 15 cents per box or section, they being full weight, a pound each. All who saw the honey declared it to be as fine as they ever saw. The sale was made at a home market (our county town).  
Cuba, Kan., Mar. 24. W. H. EAGERTY.

I received the A B C of Bee Culture, and to say I am very much pleased with it is expressing it lightly, as I would not take \$5.00 for it if I could not get another copy. It certainly ought to be the first investment of every beginner in bee-keeping. I am so much pleased with it I could not help letting you know what amount of good knowledge I have got out of it, even if I have had it only six days.  
N. Chester, Vt., Mar. 8. F. H. GUILD.

### HILTON'S CAR OF GOODS.

We unloaded and invoiced the car of goods yesterday, and to say that we are all pleased with the manner in which the goods are put up is putting it very mildly. The foundation needs special mention, and I am more than pleased with the manner in which you put up my hives and supers. My customers must be pleased with them, not only for the manner in which every thing is put up, but for the quality as well.  
GEO. E. HILTON.  
Fremont, Mich., Feb. 11.

I am probably your oldest bee-keeper. I have been in the business ever since Langstroth invented his hive (more or less). I went ten miles to see the first Langstroth hive, and I paid \$8.00 to R. K. Otis, of Kenosha, Wis., for an individual right. I also went ten miles to see the first Italian queen. She was purchased by Joseph Pencil, of Stephenson Co., Ill., of M. M. Baldrige, of St. Charles, Ill. I have 35 hives.  
Your friend, JOHN BARFORD.  
Cross Keys, De Kalb Co., Ga.

I am well pleased with the variety of reading-matter in GLEANINGS. A. I. Root's travels in the Southwest, Mr. France's pioneer story, and Fred Anderson, all help to break the dose. When we have so much bee-literature and nothing else it gets monotonous. I am great for variety, especially in reading-matter.  
I. N. AINOLD.  
Kalona, Iowa, Jan. 5.

### THE LEAN-MEAT DIET, AND WHAT IT DID WITH HOME TREATMENT—NO DOCTOR.

I had an attack of old man's diarrhea, which lasted for several weeks last fall. I hunted up your description of the lean-meat diet, and bought a cheap sausage-grinder to prepare it. The meat helped me out of the trouble, and probably added several years to my life.  
O. B. BARROWS.  
Marshalltown, Ia.

### THE IGNOTUM TOMATO FOR CANNING-FACTORIES, ETC.

The Ignotum tomato seed I bought of you last spring produced the best and largest tomatoes I ever saw. The proprietor, Mr. S. Z. Hofbaker, of the canning factory at Belleville, said I brought the finest tomatoes to the factory, all through the season, he had bought. I tell you, they were hard to beat.  
LEVI B. YODER.  
Belleville, Mifflin Co., Pa.

### OUR ADVERTISING COLUMNS.

Please find enclosed 40 cents in payment for adv't in Jan. 1 GLEANINGS. I have been confined to the house for three weeks with bronchitis, or would have sent the money sooner. As usual the ad. effected an exchange promptly. I do not remember an instance in which an ad. inserted in GLEANINGS has not brought me prompt returns—not simply answers, but actual trade or exchange.  
Newtown, O., Jan. 27. J. FERRIS PATTON.

### QUEENS TO NEW ZEALAND, ALIVE.

Dear Sir:—I beg to inform you that, on the 6th instant, I received your card, and two tested queens. The queens were all right; there were two workers alive in one of the cages, and five or six in the other. There was about one third of the candy left. The queens have started laying all right. I may tell you that they are splendid, and I beg to thank you very much for sending them.  
Wm. BIRSS.  
Ohineval, N. Z., Nov. 15.

### THE NEW WEED FOUNDATION.

Those starters you sent for the hives are the finest foundation that I ever saw. It is the first Weed foundation that I have seen. I have for the past two years bought my foundation of —, with whom I am personally acquainted. I expected to this year; but those samples took my eye at first sight.  
THAD. H. KEELER.  
South Salem, N. Y., Jan. 10.

I enclosed find 25 cents to pay for GLEANINGS to April 1, at which time please discontinue it, if I do not send another remittance before that time. I should have stopped it at the close of 1896 had it not been for Fred Anderson, of which I want to see the conclusion. Though past three-score years and ten, I like to read any thing written in such a style as to recommend the religion of our Lord Jesus Christ; and sometimes this is best done by such stories, as many will not read more solid articles. I still like GLEANINGS, but my sight is failing.  
Mansfield, W. Va., Jan. 20. LUCINDA A. ZINN.

Mr. Root:—I wish to express my hearty thanks for GLEANINGS; it has been a welcome messenger at my table for many months. It always revives the pleasant memories of my boyhood days when I studied your A B C, and had my mind filled with humming visions. I shall never forget the early impressions made on my mind by your earnest and tender messages. They seemed meant for me, and made me hunger for a holy life; and I must say that it is with the greatest of pleasure that I still read your Home talks and expositions of the truth. I have but one sentiment for GLEANINGS—my God bless it in its twofold mission, and spare its editors for many years of precious seed sowing.

Yours fraternally,  
Dresden, O., Dec. 2. REV. W. H. WILSON.

## QUEENS TO NEW ZEALAND.

I am pleased to say I received the queens all right—two of them alive and the other only just dead. There was still a little movement in her when she arrived. There was only one bee alive with one queen, and two with the other. This shows the advantage of their coming in an envelope in the letter-bags. They arrived one day earlier than GLEANINGS did. They all had two or three cells of honey left, but the candy was all gone except in the one that was dead. I believe it would be better if the lid were put close on the wire, and the ventilation to be by holes in the sides of the cage only, as it seems to me that the bees worry themselves to death.

T. G. BRICKELL.

Dunedin, N. Z., Dec. 23.

[Mr. B. in his order, requested that we put on letter postage, believing that would secure more prompt delivery. We did as requested, and the above is the result. But perhaps it would be well to state that we sent other queens at the same time and to the same country, with ordinary postage, and the queen went through alive.—Ed.]

## Root's Goods.

Before placing your order for this season, be sure to send for Root's

### 1897 Catalog, ready now.

Our 1897 hives, with improved Danzy cover and improved Hoffman frames, are simply "out of sight." Acknowledged by all who have seen them to be a great improvement over any hive on the market, of last year.

## Comb Foundation.

Cheaper and better than ever; clear as crystal, for you can read your name through it. Process and machinery patented Dec. 8, 1896, and other patents pending. Samples of the new foundation free.

## The A. I. Root Co.,

Main Office and Factory, Medina, Ohio.

Branch offices at 118 Michigan St., Chicago; Syracuse, N. Y.; St. Paul, Minn.; Mechanic Falls, Me.; No. 10 Vine St., Philadelphia, Pa.

**FOR SALE.** Cheap during 1897, Italian bees and queens and Root's bee-keepers' supplies. Address OTTO KLEINOW, 122 Military Av., Detroit, Mich.

**Tested Queen** for 90 cents; untested, 65 cents. One frame nucleus, 65 cents; 2-frame, \$1.10. Discount on quantities. Send for circular. **Cooper & Gillett, Quebeck, Tenn.** Money-order office, Sparta, Tenn. (A few black queens at 15c each; hybrids, 20c.)

## Wants and Exchange Department.

Notices will be inserted under this head at one-half our usual rate. Advertisements intended for this department must not exceed five lines, and you must say you want your ad in this department, or we will not be responsible for errors. You can have the notice as many lines as you please; but all over five lines will cost you according to our regular rates. This department is intended only for bona-fide exchanges. Exchanges for cash or for price lists, or notices offering articles for sale, can not be inserted under this head. For such our regular rates of 20 c. a line will be charged and they will be put with the regular advertisements. We can not be responsible for dissatisfaction arising from these "swaps."

**WANTED.**—To exchange Italian queens, bred from imported mothers, for plants, seeds, pet stock, or Cowan extractor. What have you to offer? J. H. GARRISON, 1011 N. 23d St., St. Louis, Mo.

**WANTED.**—To exchange Belgian hares, homing pigeons, White Leghorn eggs or breeding-stock for Italian queens from imported mother, pure-bred geese, ducks, or ducks' eggs, or offers. EUGENE MANNING, Jacksonville, N. Y.

**WANTED.**—To exchange for any thing useful, 40 colonies bees; also 100 Simplicity supers with wide frames. A. Y. BALDWIN, De Kalb, Ill.

**WANTED.**—To exchange eggs from B. Rocks, W. and Buff Leghorns, S. S. and Buff P. Bantams, for wax or queens. J. HALLENBECK, Altamont, N. Y.

**WANTED.**—To exchange young laying queens for bee-hive machinery or full colonies of bees; will pay cash for bees if preferred. H. G. QUIRIN, Bellevue, O.

**WANTED.**—To exchange a brand-new set of Encyclopedia Britannica, cost \$60, also a brand-new Webster's Encyclopedic Dictionary, latest edition, bound in sheep, cost \$10, for strong hives of bees, hybrids preferred. FRED HOLTKE, care of F. Bendt, cor. Sixth and Orange sts., Newark, N. J.

**WANTED.**—To exchange incubator, hives, supplies, rubber printing-outfits, or cash. Want honey, wax, or fdn. O. H. HYATT, Shenandoah, Page Co., Iowa.

**WANTED.**—To exchange 60-lb. cans in good order, boxes, valued at 25 cts. each, delivered, for comb or extracted honey, of this or next season's crop, at the market price. B. WALKER, Evart, Mich.

**WANTED.**—To exchange full colonies or nuclei of bees for gund or W. Wyandotte pullets. I. J. STRINGHAM, 105 Park Place, New York City.

**WANTED.**—To exchange standard varieties strawberry-plants and Turner raspberry-sets for any thing useful. H. R. GEBHART, Miamisburg, O.

**WANTED.**—To exchange turnip seed or bees for mink, muskrat, and house-cat furs. C. G. MARSH, Belden, Broome Co., N. Y.

**WANTED.**—To exchange single-case World type-writer (good as new); also hybrid bees in full colony, for extracted honey or offers. A. W. GARDNER, Centreville, Mich.

**WANTED.**—To exchange strawberry-plants, Buchach, Jessie, Warfield, Crescent, Haverland, Gandy, valued at \$2.00 per 1000; Cuthbert raspberry; Snyder, Taylor, Western Triumph blackberry, cheap for beeswax. A. P. LAWRENCE, Hickory Cor., Mich.

**WANTED.**—To exchange bicycle for foot-power screw-cutting lathe, Barnes saw, or mechanic's tools. ROBERT B. GEDYE, La Salle, Ill.

**WANTED.**—To exchange talking-machine, 300 bee papers, and a 22-caliber rifle for bees or offers. B. W. HOPPER, Garden City, Kansas.

Honey Column.

CITY MARKETS.

**KANSAS CITY.**—Honey.—No. 1 white, 12@13; fancy amber, 11@12; No. 1 amber, 10@11; fancy dark, 9@10; No. 1 dark, 8@9; white extracted, 5@5½; amber, 4@4½; dark, 4; beeswax, 25.

C. C. CLEMONS & Co.,  
423 Walnut, Kansas City, Mo.

April 10.

**NEW YORK.**—Honey.—Fancy white, 11; No. 1 white, 10; fancy amber, 9; No. 1 amber, 8; fancy dark, 6; white extracted, 5@5½; amber, 4@4½; dark, no sale; beeswax, 26@27. There is some demand yet for comb honey, and selling fairly well at above quotations. While receipts are light it keeps coming in a small way. Extracted quiet and without change. Demand for buckwheat has ceased, and no more sale for it. Beeswax about the same, arrivals light and the demand likewise.

HILDRETH BROS. & SEGELKEN,  
120-122 W. Broadway, New York.

April 10.

**MILWAUKEE.**—Honey.—Fancy white, 13@14; No. 1 white, 12@13; fancy amber, 11@12; No. 1 amber, 10@11; white extracted, 6@7; amber, 5@5½; dark, 4@5; beeswax, 25@27. The season for sweet and beautiful things has come. Springtime with its life and hopefulness causes the heart of humanity to throb quicker, and the taste for sweet things is in harmony with what the eye beholds. The demand for honey is better, and the supply is getting less every day, and values on choice well sustained.

A. V. BISHOP & Co.,  
Milwaukee, Wis.

April 9.

**CHICAGO.**—Honey.—Fancy white, 12; No. 1, white, 10; fancy amber, 8@9; No. 1 amber, 7; fancy dark, 7@8; No. 1 dark, 7; white extracted, 5@7; amber, 5@6; dark, 4½; beeswax, 25@27. This month will close the season for comb honey pending the new crop.

R. A. BURNETT & Co.,  
163 So. Water St., Chicago, Ill.

April 10.

**ST. LOUIS.**—Honey.—Fancy white, 13; No. 1 white, 12; fancy amber, 11; No. 1 amber, 10; fancy dark, 9; No. 1 dark, 8; white extracted, in bbls., 5½@6; in cans, 6½; amber, in bbls., 5; dark 4½@4¾; beeswax, 24½@25, prime. We have sold 7000 lbs. of extracted honey in bbls. this week at 5 cts. There is a good demand for this class of goods from manufacturers. Fancy and No. 1 white comb scarce, and in small way would sell readily.

WESTCOTT COMMISSION CO.,  
213 Market St., St. Louis, Mo.

April 10.

**BOSTON.**—Honey.—Fancy white, 13; No. 1, 11@12; fancy amber, 10; white extracted, 7@8; amber, 6@7; dark, 6; beeswax, 25. Comb honey is selling very slowly, with a full stock on hand. Beeswax in good demand, with a very light supply.

E. E. BLAKE & Co.,  
57 Chatham St., Boston, Mass.

April 10.

**DETROIT.**—Honey.—Fancy white, 10@11; No. 1 white, 9@10; fancy amber, 8@9; No. 1 amber, 7@8; fancy dark, 7; white extracted, 5@6; amber, 4@5; dark, 4; beeswax, 24@25. There is little demand for comb honey, and quite a large stock in commission houses.

M. H. HUNT,  
Bell Branch, Mich.

April 10.

**CINCINNATI.**—Honey.—No. 1 white, 12@13; No. 1 amber, 10@12; white extracted, 5@6; amber, 4@5; dark, 3½@4; beeswax, 22@25. Demand slow for all kinds of honey, while arrivals are fair. There is a good local demand for beeswax with fair arrivals.

CHAS. F. MUTH & SON,  
Cincinnati, O.

April 9.

**DENVER.**—Honey.—Fancy white, 11; No. 1 white, 10; fancy amber, 9; white extracted, 6; beeswax, 25. We can not quote better prices than the above for our market, and we will not give a false price to the readers of GLEANINGS. R. K. & J. C. FRISBEE,  
Denver, Col.

April 12.

**MINNEAPOLIS.**—Honey.—Fancy white, 12@13; No. 1 white, 10@11; fancy amber, 9@10; No. 1 amber, 8@9; fancy dark, 7@8; No. 1 dark, 6@7; white extracted, 6@7; amber, 5@6; dark, 4½@5½; beeswax, 22@25. The demand for extracted has shown a somewhat better tone of late, but prices are nominally unchanged. Comb honey in light demand and nominal.

S. H. HALL & Co.,  
Minneapolis, Minn.

April 12.

**COLUMBUS.**—Honey.—Fancy white, 12@12½; No. 1 white, 11; fancy dark, 8. Several shipments of very fine buckwheat honey have been on the market the past week, and sold under value, i. e., 6c.

THE COLUMBUS COM. & STORAGE CO.  
409-413 N. High St., Columbus, O.

April 12.

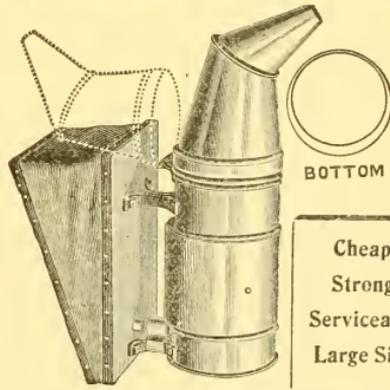

**PHILADELPHIA.**—Honey.—White extracted, 5@6; amber, 4@5; dark, 3½@4; beeswax, 26. No comb honey in our market, except odd lots broken down, no call whatever.

WM. A. SELZER,  
10 Vine St., Philadelphia, Pa.

April 12.

FOR SALE.—\$25.00 for one 500-lb. barrel of A No. 1 linn extracted honey, F. O. B. cars here; or 5½c in packages of 60 lbs. each. J. B. MURRAY, Ada, O.

The New Corneil Smoker.

BOTTOM

Cheap,  
Strong,  
Serviceable,  
Large Size.

**JUST THE THING** for those who want a first-class smoker at a medium price. Size of cup, 3¼ inches; curved nozzle, hinged so as to swing back; legs of malleable iron, secured by bolts. The blast is the well-known Corneil principle. Weight of smoker, only 20 ounces.

Price \$1.10, postpaid, or 85c if sent by express or freight with other goods.

THE A. I. ROOT COMPANY,  
MEDINA, OHIO.

**FOR SALE.**—Barnes foot-power saw. Perfect in every particular. Have made over 800 hives with it. Five saws; every thing in order; all good as new; all out of bee business—no use for it. First draft for \$20.00 takes it, F. O. B.

E. D. KENEY, Arcade, N. Y.

# A Tested Queen for 50 cts.

As usual, I am re-queening my apiary this spring with young queens, selling the tested queens, that are removed, at \$1.00 each. These queens are fine Italians, right in their prime, being of last year's rearing. I am also starting a large number of nuclei in which to test queens, and can soon give purchasers their choice between queens of *this or last year's* rearing. You ask, Where does the 50 cent queen come in? It comes in right here. To every one not now a subscriber who will send \$1.00 for the *Review* for 1897, I will send one of these tested queens for 50 cents.

There are thousands of bee-keepers in this broad land, who, if acquainted with the *Review*, would read it year after year, and it is to once get it into such hands that this special offer is made. I will also send the *Review* one year and 1000 strictly first-class sections for only \$2.50. Or a Bingham Conqueror smoker and the *Review* for only \$1.75.

W. Z. HUTCHINSON, Flint, Mich.

### STRAY STRAWS

FROM DR. C. C. MILLER.

THE SUBSOIL PLOW that costs least money of any I know about is sweet clover.

I WONDER if a thin section is not likely to be more uniform in weight than a thick one. [Yes, sir!—Ed.]

J. M. HICKS says that, 40 years ago, there were in Indiana 50 colonies of bees for every one now.—*American Bee Journal*.

J. E. FOWLER says, page 241, he intends to cut starters full size of the section, and fasten top and bottom. Better try it first on a small scale, friend Fowler, for I think they'll buckle badly, and the thinner the worse. [Yes, indeed.—Ed.]

A  $1\frac{1}{8}$ -IN. SECTION weighs how much? 16 oz., when well filled, p. 231;  $14\frac{1}{2}$  oz. ten pages later. The next man will give a different weight, and Aikin and Moll will give a different weight another year. □ You may as well give up first as last that there is no uniform weight for a section of a given size.

"SOME OF THE very people who at one time condemned footnotes to articles by the editor are now asking for them. . . . There will be more footnotes in future."—*Canadian Bee Journal, Editorial*. [I am sure our readers would almost unanimously vote for the footnotes. If for any reason, through a crowd of work on the part of the editor, they are left off, I hear from it.—Ed.]

FOUL BROOD. Col. Whipple reports as entirely successful a foul-brood cure he found in "Straws." Equal parts thoroughly mixed of pure carbotic acid and common pine tar; put two tablespoonfuls into a shallow tin box, with perforated cover under the brood-frames, and renew in three months if not cured.—*Proceedings Colorado State Convention in American Bee Journal*. [See answer to C. Davenport.—Ed.]

HERE'S MY POSTAL one—that sweet clover question, page 255. I've seen lots of sweet clover growing along the roadside where horses and cattle were allowed to feed, and it continued in health, but was never permitted to grow tall. And I've seen a few stalks in a pasture that were allowed to grow undisturbed, but I think it might have been different if there had been more of it so the stock would have learned to eat it.

"A  $4\frac{1}{4} \times 4\frac{1}{4}$  SECTION in the flat is 17 inches long," says R. C. Aikin, p. 232. I got caught on that too. I know it figures 17, but it measures  $\frac{1}{8}$  or  $\frac{1}{4}$  less. Take your rule and see. [That is true; but I suspect that the majority of people do not know that there is this difference. It has to be less than 17 inches, or the section would be a trifle more than  $4\frac{1}{4}$  when folded. The reason is, the fold at the V is not a sharp right angle.—Ed.]

YOUR FIGURES on page 232 must be amended, friend Aikin. You've taken off  $\frac{1}{4}$  in. for thickness of wood, but you must take off also  $\frac{1}{2}$  in. from thickness of honey for two bee-spaces. "A  $3\frac{3}{4} \times 5 \times 1\frac{3}{4}$  has just a trifle more capacity in cubic inches than a  $4\frac{1}{4} \times 4\frac{1}{4} \times 1\frac{1}{8}$ ," but it will hold about  $\frac{1}{2}$  in. less honey, if  $\frac{1}{4}$  in. is the bee-space. A  $4 \times 4 \times 2$  section contains just twice as many cubic inches as one  $4 \times 4 \times 1$ , but it will contain just three times as much honey.

R. C. AIKIN is perhaps nearer right than the editor in thinking there's lots of cheating with light-weight sections; but he's wrong in thinking I produce only full weights. Of late I rather favor their being so light that the customer can't be fooled into thinking they weigh a pound each. [I am not going to say any thing more about light-weight sections; for somehow the more I say about them the more I am misunderstood. I suspect that, if we could get together and "argufy" for a while, we should find that we are pretty much all of a mind.—Ed.]

DOOLITTLE, in *American Bee Journal*, is rather down on outside diagnosis. He quotes one of the outside-diagnosers who talks of going out every day during early spring, in cold

storms, to place the ear at the side of the hive, and rap, to see whether they need feeding. Thinks he'd rather take frames out once than do all that every day. [So would I. I believe in outside diagnosis to determine certain conditions. When I want to make a sure thing of it I pull out a frame or two.—ED.]

WOODCHOPPER, what ails you? On p. 239 you've mixed up Danzenbaker with Doolittle, and think I'm off to cite a crack so big that bees could go through freely. No matter how big, doesn't that prove my point that the bees commenced storing before filling the crack? But you're wrong in thinking "they never stop up a crack that they can go through freely." They'll not stop up a crack that they *do* go through freely, but many a one that they *can* go through freely, and in the very case in hand they filled that  $\frac{1}{2}$ -inch crack about half.

THE COLORADO STATE BEE-KEEPERS' ASSOCIATION passed a resolution denouncing supply-houses for changing "the present style of the standard  $4\frac{1}{4}$  section to any other style."—*American Bee Journal*. [So far as I am aware, only two sizes of sections are standard—the  $4\frac{1}{4}$  square and the  $4 \times 5$ ; and even the last named costs 10 cts. per 1000 extra. Practically there is only one standard section on the market, and that is the  $4\frac{1}{4}$  square. The sales of any other are as a drop in the bucket compared with the  $4\frac{1}{4}$ . Do not denounce the poor supply-houses just yet.—ED.]

IN REPLY, Mr. Editor, to your question how bees can walk up a perpendicular surface without a sucker, Cheshire says the pulvillus gives out a clammy secretion by which the bees *stick* on the glass, the pulvillus being thrown automatically into action when the claws fail to catch. After the bee has walked on the perpendicular glass for a time the adhesive material gives out, and the foot slips. High powers of the microscope reveal traces of the secretion left on the glass. [Yes, I remember Cheshire did say something about a secretion from the foot of the bee. Without taking time to look it up now, I am of the opinion that he also spoke of the little sucker that seems to be partially developed.—ED.]

C. DAVENPORT exposed to the fumes of bisulphide of carbon for 10 hours a piece of brood comb advanced with foul brood, then put it into a healthy hive, and it did not convey the disease. The fumes kill worms, moth, and eggs, but spoil the flavor of comb honey, and make it thinner.—*American Bee Journal*. [If bisulphide of carbon would always disinfect combs it would be a great boon for those afflicted with foul brood; but I question very much whether it would kill the spores. I should rather expect to find, in Mr. Davenport's healthy hive, foul brood in about three months' time, or about the time when the spores should have hatched,

and the active disease begun its work again. So far our own experience seems to show that nothing but actual boiling heat will kill the spores, although the bacilli themselves can very often be killed out by doses of carbolic spray.—ED.]

"SYRUP made by boiling will granulate more or less," says F. A. Salisbury, p. 239. Yes, but only, I think, because it's thicker, not because it's boiled. Make the unboiled the thicker, and see if it doesn't granulate more. The bees operate chemically on the thin more than on the thick. [I suspect you are right; but heating water has a tendency to make it take up more sugar than it will hold when cold. If it is never heated at all it will take up only what it can hold. In making syrup, people are a little careless, sometimes, and get in too much sugar for the water; but they are not as liable to do this when the water is cold, for the very reason that they can not get in too much, because it will not hold it. What it will hold at a cold temperature it will hold right along. What the water will hold when hot, it will not hold when cold.—ED.]

THE VITALITY of the spores of *Bacillus alvei* is destroyed when exposed to atmospheric air for from 24 to 36 hours, according to Dr. Howard's book. Prof. Harrison, of Ontario Agricultural College, finds them uninjured at the end of six months, if kept in shade.—*Canadian Bee Journal*. [It is well known that sunlight is a strong germicide. If people would let the sunlight stream more into their rooms there would be fewer disease-germs in them. What if it does fade the carpet some? Faded carpets are much more to be preferred than pale children faded by disease. Perhaps the difference in the opinions of the two authorities as above given can be explained by saying that one contemplated sunshine when the other did not. In that case, both may be right. One thing I am sure of, however; if I knew positively that the inside of the hive contained the spores of foul brood I would not risk 24 or 36 hours of sunshine to kill them. While it *might* do so, I should greatly prefer immersing them for a few seconds in boiling water.—ED.]

---

#### HONEY IN PLACE OF SUGAR, FOR COOKING.

I wonder if our bee-friends know that honey can be used for every thing that sugar is used for. I never buy sugar to preserve. I use honey for jellies, jams, preserves, and butters. Fix your fruit, and cover with honey; set it on the stove to cook. You can put a cover on. I make jelly as usual on the stove. I also sweeten fruit to can, make gingerbread and snaps. I do not like it in tea or coffee. It is nice in fruit cake. Flavor highly to hide the twang.

A WOMAN BEE-KEEPER.

By R. C. Atkin.

**HIVE-CONSTRUCTION; PRESENT DISCREPANCIES, AND THEIR REMEDY: A DIVISIBLE-BROOD-CHAMBER HIVE, WITH SUPERS AND BROOD-CHAMBERS OF THE SAME DEPTH.**

In my article on "Sections; Size, Weight, Shape, etc.," in the preceding number, I spoke of our present hive system as being like trying to build a nice fine house, but doing it a little at a time over a term of years. Langstroth invented the movable frame—not to fit or work with any system or set of fixtures then in use—but a *new departure* to facilitate handling bees, and in a way altogether different from any preceding method. He did not have the two and one pound sections, but made a frame that, in general shape and size, would be convenient and still make a hive surface on top, giving large room for surplus boxes.

In the course of years came the invention of sections, or single comb boxes. They were a grand step in advance; but both the frames and sections were crude as in any new developments. Improvement has gone on until our hives, in point of workmanship and finish, are very fine.

Having adopted the L. frame and  $4\frac{1}{4} \times 4\frac{1}{4} \times 2$  section, many devices have been resorted to to get the combination of brood and surplus apartments in the most convenient working order. We built a little at a time. As new features were added, the difficulty was to get the new additions to fit on to what we already had, and at the same time retain all the good points. Any one who has built a house, adding a room here, a porch there, at some other time a bay-window, etc., knows how expensive and unsatisfactory such a structure is. It seems to me this is just where we are in the matter of hives. The thing to do now is to commence anew, make a thorough study of the old structure to find its faults, then form into a new combination the valuable features in one harmonious structure.

The L. frame, in general principles, is a good one. A deeper frame of the same length would give too large a comb—more liable to break with heat or handling. Its length, when used in an eight-frame hive, makes the hive too long and narrow. A square house both conserves heat and saves material. The L. frame takes a chamber  $18\frac{1}{4}$  inches long. Four  $4\frac{1}{4}$  sections equal 17 inches; hence, when we put these sections over the L. frame we have  $1\frac{1}{4}$  inches to

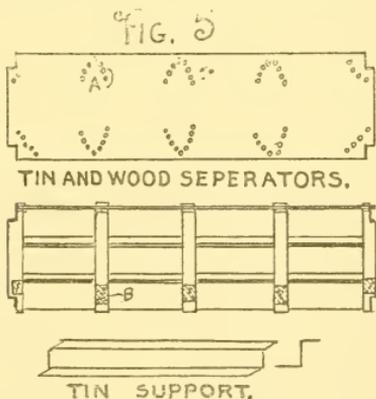

lag up in some way. If wide frames or section-holders are used we can fill the surplus room with their ends. Wide frames are undesirable. Holder-bottoms and pattern-slats must match the section-bottom, and even then two difficulties appear—sagging of the bottom, and slightly out-of-true sections. These two features make a lot of room for propolis. The T super has fewer objections on account of propolizing, yet the sections are necessarily loose or wide apart at the tops—corresponding to the thickness of the T's. This super is better than wide frames or holders.

In the earlier days, the great object sought after was a knowledge of the habits of the bee, and to control swarming. Our hives were constructed more for that than any other purpose, the shape and appearance of the surplus honey being a secondary consideration. Research into the habits of the bee has brought that down to a science, and in such shape that we now can learn from books and journals what then we sought by personal observation and practice. Our great object now is to apply our knowledge in such a way as to make it yield financial returns.

Since, then, we are not now keeping bees so much to study their habits as to profit financially, and since this profit must come from the surplus apartment, I deem it proper to put that first. Instead of fitting the super to the brood-chamber, I would fit the brood-chamber to the *best surplus fixture*. Having arrived at this conclusion, let us find out what is

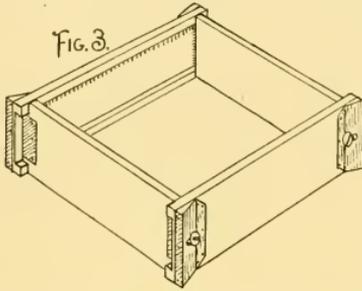

#### THE BEST SECTION AND SUPER.

In the previous article I discussed sections at length, and therein took my stand for a  $4 \times 5 \times 1\frac{1}{4}$  section, the sides  $1\frac{1}{4}$  their entire length, and the tops and bottoms a trifle wider, their entire

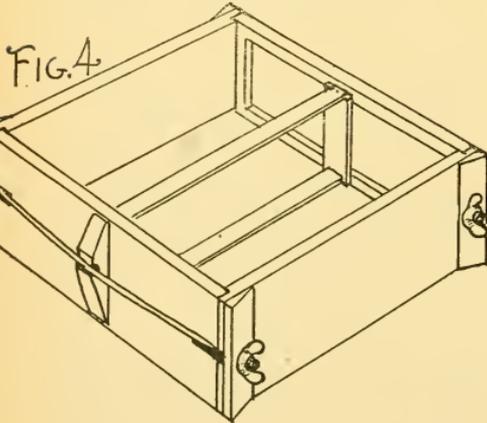

length, than the thickness of the *finished* comb. If the section be  $1\frac{1}{4}$  thick, the top and bottom should be about two bee spaces less in width than the sides, or  $1\frac{1}{4}$  inches wide. Four 4-inch-wide sections equal 16 inches, the inside length

of my super. Being 5 inches deep, my super must be  $5\frac{1}{4}$  inches deep. Eight  $1\frac{3}{4}$ -inch sections equal 14 inches. I am going to recommend separators  $\frac{1}{8}$  inch thick; and where the section uprights join the separator I will cleat it across with  $\frac{1}{8}$ -inch cleats, so my separator will be  $\frac{3}{8}$  inch thick where the section joins it, having a half bee-space in each face, between cleats. See illustration of wood separator in Fig. 5. Since I allow a half bee-space—count-

ing  $\frac{1}{4}$  inch as a bee-space—in each face of the separator, I will cut down the thickness of my sections just that much. This will make my sections just  $1\frac{1}{2}$  instead of  $1\frac{3}{4}$ . My super will then be 8 sections  $1\frac{1}{2}$ , plus 7 separators  $\frac{3}{8}$ , plus  $\frac{1}{8}$ -inch strip on each super side, a total inside width of  $14\frac{3}{8}$  inches. The super is to have adjustability in its width, so I have it  $5\frac{1}{4} \times 15 \times 16$ . Fig. 3 shows rim or body.

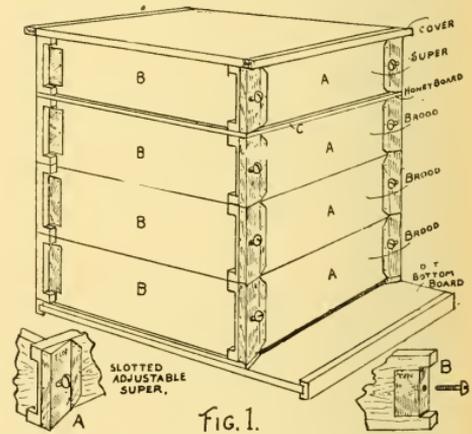

If one uses the tin separators, the sections should be  $\frac{1}{4}$  inch thicker than with the cleated wooden one. If the cleated one be used with the thin section, when the sections are cased for market there will be only  $\frac{1}{4}$  inch space between comb faces, whereas with the plain separator there is  $\frac{1}{2}$  inch space. These thin sections will not require the case to be so wide by  $1\frac{1}{2}$  inches in the 24-section size.

Our old hives have been so constructed that the brood-chamber could not be interchanged

with surplus fixtures, except when extracting. I purpose having brood-chambers, extracting-supers, and section-supers completely interchangeable, that the same body may be used for either. To accomplish this I make the brood and extracting frames just the depth of sections, and just as long as 4 sections, and close-fitting wide end-bar. See frame in Fig. 4.

The sections are supported in the super by the separators, the little spurs shown at A and B—see Fig. 5—being imbedded in the uprights of the sections, and all held there by compression, the compression being applied when the super is filled, and sustained while on the hive by the bolts, shown in Fig. 1, or by rods as in Fig. 4. The rod method, as in Fig. 4, is the original form as patented in the Aikin-Knight "K. D." hive. The bolt method, as in Fig. 3, is equally good, is neater, allows greater latitude in adjustability, and places the nuts and threaded parts away from wet and rust. The separators are longer than the net inside measure of the super, and reach past the sec-

tions into the inset or gain in the super ends, hence the compression has simply to hold the mass together, the weight being carried by the separator ends on the shoulder in the inset. The brood-frames are held in the same way, except that the tin support (see Fig. 5) hangs on the inset shoulder and under the frame end at the bottom.

This hive is a divisible-brood-chamber one, hive-bodies to be used as brood, extracting, or sections, at will. Taking out frames and tin supports, and putting in sections and separators, converts it from one to the other. Both comb and extracted can be produced at the same time.

SWARMING CONTROLLED.

My method of controlling swarming is by unqueening. This, with ordinary hives, requires removing queens, then nine days later removing all cells but one, or even all, and giv-

ing a queen. This ninth-day work comes after the honey-flow has begun—a busy time—and the labor increased, because of much honey in the combs. I propose to cut off that trouble by putting the queen excluding honey-board between the brood-sections ten days before the flow, and the eighth, ninth, or tenth day take away the chamber that has the queen and *open* brood, leaving the one with sealed brood and working force on the old stand with the sections on. Three or four days later I can give the old colony a ripe cell or virgin queen. You see I left them with only *sealed* brood, when I took the queen, so they could not build cells, nor can they till the young queen gets to laying, and by that time the brood is hatched, and they are just like a colony that has swarmed and reared a young queen of their own.

How long and how extensively have I used the "fixin's" here described? Of the principles, I have used nearly all of them—some quite largely. The complete hive, just as illustrated, has not been used. I have supported sections in this manner, used shallow frames in divisible hives, as shallow as  $4\frac{1}{4}$ -inch frames; have tried both forms of compression—in fact, almost the entire thing. I know it will work.

Loveland, Colo.

[There is quite an advantage in having brood-chamber and super of the same depth; but there is the disadvantage that one brood-chamber is too shallow for many localities, and two (one on top of the other)—well, many don't like them for the reason that, for some operations, there are too many frames to handle for one brood-nest.

Mr. Aikin's method of supporting sections by means of the separators is a little like the plan advocated by Oliver Foster some ten years ago. The sections were supported by cleated separators, and the super sides were made to compress against the sections and separators by a locking-device at the corners; but I think he used the arrangement only a short time.

I should say the old clamping-device, as shown in Fig. 4, would be very much better than the new one shown in Fig. 3. The screw and tins in Fig. 3 appear to me to be too "flimsy." Moreover, they would always require the use of a screwdriver. The thumb-nuts in Fig. 4 could be worked by the fingers, and, when clamped, would be much more substantial. I believe Mr. Aikin would make a mistake to discard the thumb-nut and bolt arrangement that he has tried, for something he has not tried that has the appearance of being "flimsy."—ED.]

### THE EUCALYPTUS AS A HONEY-PLANT.

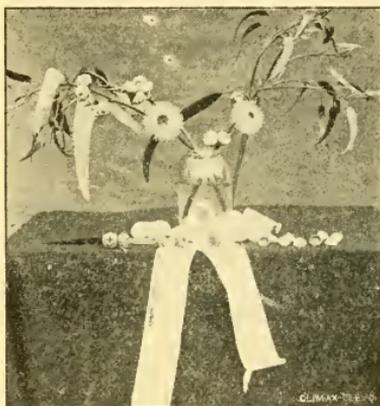

ITS VALUE TO BEE-KEEPERS AND ADAPTABILITY TO CALIFORNIA SOIL; THE CHARACTER OF THE HONEY.

By W. A. Pryal.

A quarter of a century ago the eucalyptus was a rare tree in California; but to-day it is one of the most common of the numerous foreign trees to be found here. Perhaps it might be safe to say that it outranks either the olive,

the grape, the lemon, or the orange; and we all know that these are extensively grown here, and have attained a world-wide fame by their productiveness in their adopted home.

Of the several hundred varieties of this genus of trees to be found in Australia, Tasmania, and sparingly in the Malay Archipelago, but comparatively few have been introduced into California. Of these the Tasmanian blue gum (*Eucalyptus globulus*) is by far the most common. The accompanying illustrations are of this tree

The engraving of the flowers of a gum-tree, shown on page 155 of the current volume of GLEANINGS, and therein described in the accompanying letter-press by Mr. J. H. Martin, is a variety that is rare in California, especially in the central portion, where the great majority of the gum-trees are grown, because of the more moist condition of the soil there. There are several varieties that are quite ornamental, among them being that described by the above-named writer. As briefly stated in previous issues of GLEANINGS, this genus of trees is interesting to bee-keepers on account of its being a prolific yielder of nectar.

#### A FEW OBSERVATIONS IN RELATION TO THE TREE IN GENERAL.

The trees (I am going to confine myself almost entirely to the red and the blue gum in this article, and when I speak of the tree it will be understood that it is of these two varieties, unless otherwise stated) grow to a great height. Some have been found in their native country almost as tall as some of the celebrated big trees of California. Some of the trunks of these tall trees have a diameter of from 8 to 16 feet. The wood of a well-matured gum-tree is very durable, and may be used for a variety of purposes. It is necessary to work it up as soon as possible, as it soon becomes very hard. When green, it is as easy to work as willow.

There are several peculiar things about the

THE EUCALYPTUS: THE HONEY-BEARING TREE OF CALIFORNIA.

gum-tree that are not found in other trees. We have all observed that, in the leaves of the trees we have about us every day (of course, some of us do not see many leaves in winter, which is not the rule in California and other favored parts of the earth), the upper surface is turned to the sun, while the lower side is facing the earth. In the gum, this is different. One of the edges of the tree is turned toward the sun, thus always exposing the leaf to the light. The color of the leaves is not of that green appearance that we are wont to see in the leaves of the trees we find in this country. The color is generally of a bluish or pearly-green hue. The leaves of the red gum are much greener than those of the blue, and do not have the gray color while young. Botanically they are what are called alternate, though in the young trees they are opposite, and of a more blue or pearl color. The first form is shown in the cut of the flowers; the latter is apparent in the young growth of shoots shown in the left of accompanying half-tone. Shoots that spring from the stumps of trees that have been cut down, or branches that have been severely trimmed, have the same characteristic of leaves as those of young trees. When the young trees have attained their second or third year they begin to put forth their alternate leaves.

I do not know of any tree that is easier to raise from seed than is the gum-tree. Of course, they will not stand a cold climate, and sometimes even in California a sharp frost is apt to nip the tips of the young plants. For this reason it is well to start the seed under glass in the fall, and in the spring transplant the little seedlings into shallow boxes, say 50 plants in a box 16x20 inches. When a foot high they may be set out where they are to remain. It is always best to set them out where they are to grow up into trees as soon as possible, that the tap-roots that the tree sends deep into the earth may give it that anchorage required to maintain aloft the large amount of trunk and branches that it may spread out.

For a long time it was thought here the tree would not self-seed in this climate. But since several generations, so to speak, of the trees have been grown here from seed from home-grown trees, it is now found that seed that falls upon any thing like fertile soil germinates and grows into thrifty trees. The finest growth of self-grown trees that I have seen is on the banks of the Temescal, where a hotel had been destroyed by fire. The heat of this fire killed some of the gum-trees that stood near by; but the trees, in dying, shed their seed that was in the seed-cones, some little time after the fire, upon the debris of the ruined building. To-day the spot is covered with gum-trees fully sixty feet high, that sprung from the seed that thus fell upon the site of the burned hotel.

The trees shown in the half-tones herewith are about 20 years old. Those on the hill back of the house in the valley were planted by the late J. Ross Brown, the American humorist, traveler, and United States Minister to China. The tops of the trees in the left foreground are on the bank of the Temescal, and are fully 150 high. The scene of a bit of a gum forest is taken in a grove of 100 acres or so known as Rockridge Park, a private property in the hills east of Temescal. A clearing was made in that portion shown in the left foreground of the photograph a year before it was taken; but the cleared part was soon covered with a growth of young trees or "suckers" that sprang from the stumps that remained in the ground. The gum is like the California red-wood in this, that it is a hard tree to kill unless it is rooted out.

By looking carefully in among the trees in the center of the photo, just above the upper fence, two cords of wood may be seen piled up. This forest is being thinned out so as to give the remaining "bean-poles" a chance to become good-sized trees.

Quite a trade is carried on in Alameda County by persons who cut and sell blue-gum wood for fuel. There is a company in Oakland that secures the leaves of these trees, and, by a patented process, converts the resinous and volatile liquid obtained therefrom into a preventive for the incrustation of steam-boilers.

I have found that the leaves and bark, especially the strips that the trees voluntarily shed each year, are an excellent fuel for bee-smokers. The aromatic odor of the smoke seems to have a salutary effect in quieting bees, and the odor is not unpleasant to the apiarist after he becomes used to it. The smoke of the leaves is recommended by physicians for the cure of asthma.

The numerous varieties of the eucalyptus have an extended period of florescence, and it may be possible to plant half a dozen varieties and thereby obtain a continuous succession of flowers the year round. Some varieties are said to bloom twice a year, though I have not noted any doing so. I have seen some blooming a few months after the tree last ceased its round of inflorescence. The two varieties common in the central portion of the State, the varieties already named, bloom for a good part of the year, and, as stated, at a time when honey-secreting flowers are most needed for the bees.

The blue gum, the flowers of which are shown in the illustration, usually begins to expand its petals or anthers in December, and I have known it to continue in flower for five months. One may well imagine the amount of flowers a tree 150 feet high will produce. At the writer's home on the Temescal, a few miles north of the city of Oakland, are several blue

gums and one red gum (the tops of two of the former are shown in one of the scenes in the cut) that are probably over 150 ft. tall. One of these trees has a diameter a little over 3 ft. As these trees will grow much taller for some time, they are beginning to fill out in girth. They are nearly 25 years old.

The flowers begin to open on the sunny side of the tree, beginning usually on the branches nearest the earth, and gradually extending upward and about the tree. The whole of a tree is never in bloom at one time; neither are all the trees of the same variety in a period of floescence at the same time.

The flowers of the blue gum are about 2 inches in diameter; those of the red gum, about  $\frac{1}{2}$  inch; but they are much more numerous, and are borne in clusters of twos and threes. These flowers are rich in nectar. A gum-tree in bloom is a veritable paradise for bees. They just swarm amid the flowers.

Generally speaking, the chief aim of the bee-keeper is to sell his honey at the highest price possible. To do this his honey must approach nearly a water "whiteness." Yet there are times when honey is of more value to the apiarist than when it is of the character mentioned. This is true in a great measure of eucalyptus honey. The honey is, so far as I have been able to learn from experience, dark, and, when well ripened, thick. Its taste is aromatic and slightly unpleasant, partaking of the tannic and resinous properties of the fluid secretions of the body of the tree. This honey is said to possess medicinal virtues.

The value of this honey to the apiarist lies in the fact that it is produced at a time when his bees are generally sorely in need of winter or early spring stores. One of the greatest causes of loss of bees in this State is the open winters, during which time bees consume much honey, and have little or no chance of gathering any, owing to the want of a supply of native or other flowers at that season of the year. The eucalyptus is the only tree that flowers in California during this period, except the bay, or laurel, which is more of a pollen-producer, as it is not known to yield honey. For this reason the family of eucalypti is a boon to the California apiarist.

I do not believe that the honey will ever prove of any merchantable value to the honey-producer unless it is discovered to have some special medicinal properties. But as a means of keeping weak colonies from starving, especially where the owner does not feed his bees, and for promoting early brood-rearing, so that the colonies will be in strong condition when the harvest of light-colored honey is ready for the bees, the eucalyptus is of inestimable value.

Where the bees have been able, by being close to a gum-tree grove, to gather a surplus, it may become necessary to extract this honey in the

latter part of April, otherwise the bees may, as I have known them to do, carry this honey from the brood-chamber up into the supers.

I would advise bee-keepers in all parts of the State, where it is not too cold, to set out all the young trees of this great honey-producer they possibly can. Besides being valuable to them for the nectar it will afford their bees, they will find it valuable for shade, windbreaks, posts, fuel, and other purposes that will suggest themselves.

North Temescal, Cal., March 25.

### HOW I SOLD HONEY.

SOME OF THE DISAGREEABLE FEATURES OF THE BUSINESS; A VERY INTERESTING ARTICLE.

*By Alice Harding Crossman.*

We had a large crop of honey on hand, and I felt sure we could sell a quantity at the house if people only knew we had it for sale.

I persuaded my husband to put up a sign, so he nailed up a large board on the gate-post, "Pure Honey for Sale, 10 cts. per lb." I was in ecstasy. Now I felt sure we should sell honey.

We lived on a main road not far from the city. I waited patiently for some one to buy honey. "It will take a little while to advertise," I surmised. It was delightful to imagine money coming in for honey.

My husband was away during the day, so I felt I had the business to myself. One morning, when I had the busiest day before me, and things seemed to pull backward any way that particular morning, my baby was sick and my head ached. But I was trying to hurry, when I heard a knock at the front door. I opened it, and there stood a little boy.

"Got honey to sell?" he asked.

"Yes, we have honey."

"Well, I want a dime's worth, but ain't got nothin' to put it in. I want to hunt bees." I hunted a can and gave him the honey. This took quite a while. When I returned to the kitchen I started with new energy at my work, when knock! knock!—some one else. I opened the door. This time it was a young man in hunting costume. He took off his hat and said, "I should like to get some honey."

He wanted thirty cents' worth to take on his trip. A few moments was taken in directing him. Then I went back to the kitchen. "Oh!" I thought, "I wish people would not come until I get my work done." I left the dishes, and prepared to churn, for the butter must not be neglected. I was just taking the butter from the churn, when there came a continued rapping at the door. I hastened to open it. An old man glared at me a moment, then said, "I see you have honey for sale."

"Yes, sir."

"Ten cents a pound?"

"Yes, sir."

"I want to see some of it."

"Very well; I will bring you a sample."

I hastened through the house on out to the honey-room to get some honey. "Why did a man leave his] honey so far away?" Then I remembered I had never asked my husband] to bring any sample honey to the house. I drew some and hurried back to the house, and found that horrid old man in the kitchen. I felt afraid of him, but bravely handed him the bucket of honey and a spoon. But he ignored that spoon, and sent a long brown finger down into that bucket. He stripped it to his mouth, smacked his lips, then dived into the bucket again. I could not stand that. I hastily drew the bucket away. After he had licked his finger clean he said:

"I want some of that honey, shore and certain; have you got any thing to put it in?"

I felt anxious to get rid of him. "Yes; we have buckets. I can sell you one."

"But I don't need any buckets," he said, glaring at me.

I then tried to explain that, if he would bring the bucket back, I would refund his money. He didn't seem to hear me. He was looking about him. I thought he had forgotten me, when he turned on me and said:

"You could put it in a jar, a glass jar, couldn't you?"

"Yes," I answered, not knowing what he was going to do. Without a word he stalked out of the house.

"Great Scott! what should I do?" I thought I would go and see what had become of him. I stepped to the front window in time to see the old man take a half-gallon Mason jar from his old buggy. It was filled with sweet milk. He hesitated, turned the jar around, and looked at it as if undecided. I stood and wondered what he was going to do. At last he had settled the question in his mind, for he removed the lid and tilted the jar and began to drink. I laughed aloud. It did look too funny. He drank half of the milk, then seemed undecided whether he could finish the rest. After looking all about him he scrutinized the jar again. After some hesitation he proceeded to empty it into the same gullet. I can never keep from laughing when I remember that sight. He was coming back to the house. I went to the door, thinking perhaps he would not come in; but, no—he followed me back to the kitchen. He spied the butter. He began to ask questions.

"That's shore fine butter. What do ye feed yo' cows?"

I told him.

"How many cows have ye got?"

"One."

"You didn't make all this yer butter off'n one cow?"

"Yes, sir, we have only one cow."

"How much milk did ye have?" he asked, tipping the barrel churn.

"I churn the cream; this is the milk, I said," pointing to a jar. "How much honey did you want?"

"Hey!" He looked at me, then continued: "Oh! you must be mistaken; you couldn't get that much butter off'n one cow."

"I will get your honey," I ventured to say.

After more quizzing he followed me out.

"That jar is clean," he protested, when I started to wash it. "Yes," he continued, "of course it's clean; it only had sweet milk in it."

"But wouldn't it spoil the honey?"

"Wall, may be so; yes, wash it. Now fill it full," he said.

"It will hold fifty cents' worth."

"I don't care; I want it full."

After a long time I had the pleasure of seeing him get into his buggy. It was after twelve o'clock. The baby's fever was high, but I hurried as fast as I could. Company came in directly after dinner. As they were leaving I fancied I could get something done. I was hardly at my work when I heard a knock. Two well-dressed ladies this time.

"Will you come in?" I asked, as they did not state what they wished. I noticed they had a small five-pound lard-bucket. They entered the parlor.

"We came to see about buying some honey; have you nice honey?"

"Yes, we have extracted honey."

My fancy took up the theme. Now I was going to sell, oh! perhaps a great quantity."

I tried to look as sweet as honey, as I was so very glad I was about to sell some. I would show my better half that it wasn't "useless" to put up a sign.

"Let us see some of your honey," one woman said.

I hastened out and brought back a sample. They tasted, and bragged and commented. Oh, I was so delighted! I was thinking what I would tell my husband. They tasted again, then fell to discussing how much they would take.

"You can get some this time, Lura, and I will get some next time."

"Well, all right," Lura answered.

"We will take ten cents' worth. I brought a bucket."

My feathers fell. When I came back with the honey they were looking at the photographs, and every thing in that room was examined. Supper-time was at hand. Why didn't they go? I found they were in no hurry. I felt desperate.

"You will have to excuse me; my baby is sick, and I have my work to do," I said, rising from my chair in what I intended for a very suggestive manner.

"Certainly," they both said.

"Is the baby much sick?" Lura asked.

"I declare! I never dreamed you had a child, you look so young."

"I am not old enough to have very much sense."

"Oh! you really look so young; don't she, Ida?"

I looked around me.

"Yes, I can't do my work and entertain company at the same time." I had no thought of leaving these two women in that room alone. "My husband is coming. I think he will want his supper."

"I expect we had better go, Lura," Ida suggested.

With much adieu they departed. I wished I had been a large commanding figure about that time. I felt I would at least make people understand I was not playing housekeeping.

"What success?" the partner of my joys asked when he came in.

"Not much success, but I guess it will be different to-morrow."

When I told him about the old man and the jar of milk we had a good laugh together.

I will get a good start in the morning, before any one comes; and I did get the dishes washed when I heard a loud knock. I hastened to the door. "I want to get some honey."

"Yes, sir; come to the honey-house."

The man followed, saying, "I am in a hurry."

He sampled the honey, and bought a dollar's worth. I was filled with new hope. I reached the kitchen. A knock? Yes. A girl wanted a pound of honey. She came in and kept me from my work. It was not long until I opened the door and found a peddler. He tried to sell me soap, or exchange for honey. At last I shut the door in his face.

*To be continued.*

---

### DRAWN COMBS.

COMB AND WAX; THE MELTED-BUTTER ARGUMENT SIFTED; THE HEAVIEST BLOW AT THE COMB-HONEY MARKET.

*By C. C. Miller.*

If I remember correctly, it was A. I. Root who first advised taking a super or one or more sections in which bees were at work, and giving them to another colony that was slow at getting to work in sections. Bees and all were to be taken. Then I think it was G. W. Demaree who said bees would start work in supers if in the supers were put a section each that was partly filled with honey, no matter when it had been filled, and no bees need be given with it. Possibly I misunderstood him as to the necessity of having honey in the section; but that was the way I understood it, and it was not for some time that I discovered, perhaps accidentally, that neither bees nor honey was needed. All

that was necessary was to have sections containing comb that was partly or wholly drawn out, and from that time I have always used one such in the first super of the season given to each colony, giving such section the name of "bait" section, or merely "bait."

At one time there was a wide divergence of opinion as to the advisability of using unfinished sections, some insisting that the bees would commence on the raw foundation and fill and seal the sections before the baits were filled, that the honey was of poorer quality in them, and so on. The character of those making these objections was such that there was no doubting that in their cases the objections were well founded. The one objection I can easily understand; for if in the bait the least speck of honey from the previous season is left, the granulation will affect the new honey stored. That the bees would be slower at filling the bait sections than the other ones, I can not possibly understand, unless it be that the sections had been left on the hives unused so late in the season of the previous year that the bees had varnished the foundation or comb with propolis. I have, unfortunately, had a large experience in deciding which sections would be sooner accepted and filled by the bees. In different years of failure of the honey crop, I have put on supers containing bait-combs, and the baits have been filled and sealed, and the sections with foundation left untouched. Not merely an occasional case, but hundreds of them. Just the one section in the super was filled and sealed, and the others left as empty as when put on.

I have seen it stated that, when unfinished sections were used, they should be cut down or leveled down until the cells were not more than  $\frac{3}{8}$  of an inch high, the idea being entertained that B. Taylor used his Handy comb-leveler simply for the purpose of having cells not so deep. I think this is an entire mistake. I am not positive about it, but I *think* Mr. Taylor used the leveler for the sake of removing any objectionable part, no matter how deep the cells might be. If unfinished sections have combs that are drawn out full depth, there will be a variation as to depth; and when these sections are used over again there will be places where the comb will come so near the separator that the bees will bridge between. So the comb is leveled down enough to avoid the possibility of having the sections thus spoiled.

Another reason for leveling down, and the principal reason, perhaps, is that the unfinished sections are those generally that have been on somewhat late in the season, when bee-glue is plentiful, and having been left on for at least a short time after the cessation of the honey-flow, the bees have laid a rim of glue about the mouth of each cell. Such sections would be unfit to use without first removing this rim of glue, and the removal is quickly effected with

the leveler. Except for these two reasons I would not cut down the depth of the cells. If it's a good thing to have the cells built half, it's a better thing to have them entirely built out. For bait combs I always prefer those built out as much as possible, only so they are perfectly clean and white, and will not come close enough to the separators to be bridged.

It may be said that, with such deep cells, the honey will not be evaporated so quickly as in those more shallow, and there may be a very little in this. But if that is any argument in favor of cells  $\frac{3}{8}$  rather than  $\frac{1}{2}$ , it is equally an argument in favor of  $\frac{1}{2}$  rather than  $\frac{3}{8}$ .

The question as to how much more honey could be secured by having drawn sections than by having merely foundation is one not easily settled. Great difference of opinion prevails as to the difference between the amount of comb honey and extracted from the same colony, some saying nearly the same, and some saying three or four times as much extracted as comb. Whatever the difference may be, it seems there ought to be nearly as much honey obtained in drawn combs in sections as of extracted. If the cells are of the same depth in each case, and the extracting-combs are sealed before extracting, there ought to be no difference.

Interest in this whole matter has been freshly aroused by the advent of the new foundation with side walls  $\frac{1}{4}$  inch deep or less. I confess that I have not been so enthusiastic as some in thinking this new product will be of such immense advantage.

A year or so ago I received from Germany a sample of comb made by machinery, the cells being of full depth, and German bee-journals seemed quite jubilant over it. It was so heavy that there was no thought of using it in anything but brood-combs; but it took so much wax as to make a brood-chamber full of it rather expensive. So little has been said about it since, that I doubt if it has gone, or, indeed, ever will go, into general use. The sample I have received from The A. I. Root Co. is a marvel of delicacy compared with the German sample, yet before we know how much advantage it will be we must know at what price it can be had, and it must be fully and fairly put to the test.

There is probably no question that, in general, bees will store more honey in old combs than in combs that must be wholly built as the storing is going on. And the nearer we come to furnishing complete combs, the more we help the storing. But cells  $\frac{1}{4}$  or  $\frac{3}{8}$  deep will not be as much help as cells of full depth. Even if wax enough be furnished to make full-depth cells, it isn't easy to figure how much the drawing out will cost the bees.

Again, it is a problem whether under any and all circumstances the bees will thin down the cells to natural thickness. While in some cases

it might be profitable to pay \$5.00 a pound for drawn comb to be used as bait, a single section in the first super of the season, it by no means follows that it would be worth any such figure to fill the whole super. After the first super, bait is perhaps of no value; for when an empty super is put under one partly filled, there is no trouble as to bees commencing promptly to fill the empty super if they have any thing with which to fill it. All these things must be taken into consideration in trying to settle upon the real value of the new invention.

Another thought presents itself. Suppose every thing goes according to or beyond the highest expectation of the most sanguine, and just as much comb honey can be produced as extracted, comb honey not requiring the special skill for its production that is now required, the producers of extracted honey will largely turn to the production of comb honey. That will lessen the amount of wax thrown on the market, increasing the price of foundation, and the greater amount of comb honey will at the same time lower its price. Will those two changes be a distinct advantage to the present comb-honey producer?

While I think it wise to look on all sides of the question in considering what may be the real value or lack of value to bee-keepers, of foundation having side walls much higher than at present made, and while I think it may be wise to be somewhat conservative in one's expectations, I do think one ought to be entirely fair; and some of the objections raised seem not only unfair but against the real interests of bee-keepers. It might be fair to say, "I don't believe it will do to give bees side walls of greater depth than are now given, for they can not be made as thin as the natural comb, and I'm afraid the bees will not draw them out to the natural thinness," but such an objection, uttered by any fair-minded person, would be followed by the remark, "But it is certainly entitled to a trial; and if, upon trial, we can have by its use just as good comb honey as we now have, then I can have no objection to it." But that isn't the way the matter is treated. The *Review* and *Progressive* teach that the great objection is to the *material* used.

Let us look at the argument of the *Review*. "Comb, natural comb, is of a light, friable nature—like the feathery, new-fallen snow." Now, that reads quite smoothly, and, taken with what follows, would make a novice think himself imposed upon if a bit of foundation in comb honey were imposed upon him. But it is misleading, and I can not help wondering that W. Z. Hutchinson, a man whom I look upon as remarkable for his fairness, should be led into such sophistry. Natural comb is "light." Per contra, we are to suppose that foundation is "heavy." Cut a piece of the side wall of a comb, and then cut a piece of the side wall of

foundation of the same shape and size in every way, and isn't one as light as the other? How much more friable is comb than foundation? "Friable," according to the dictionary, means "easily crumbled or pulverized." Natural comb, dried with age, becomes brittle and friable; but freshly built comb, at summer temperature, is soft and yielding—pliable rather than friable. I doubt whether there is a perceptible difference in the friability of fresh comb and fresh foundation. Both become more friable with age.

"Once this snow has been melted, it can never be restored to its former state. . . . In a like manner, once comb has been melted into wax, its character is changed. It is no longer comb, but wax." Is it possible, friend H., that you don't know that freshly built comb, made entirely by the bees, without any intervention of man, is wax, and nothing but wax? "Butter is butter; but melted butter is grease; so comb is comb, but melted comb is wax." I suppose in the strict sense of the term that butter, either melted or unmelted, is grease; but probably the word is here used to stand for something objectionable.

Since writing that last sentence I have had my dinner, and had three kinds of butter—some that had never been melted, some that had been heated just enough to melt it, and some that had been thoroughly heated for some time, and kept above the boiling-point. Tested separately, the last had a distinct cooked taste; but on bread I don't know that it could be detected; and the sample that was merely melted had no change that could be detected. All were excellent; and, living in the heart of the Elgin butter region, I think I know what good butter is. I wonder, when friend Hutchinson quoted that sentence, whether he stopped to think what melted butter really is like, and whether he had often sampled it. Did he ever eat hot biscuit, butter, and honey? If he did, he surely ate melted butter, or "grease," as he calls it. Did he never eat melted butter on hot toast, beefsteak, in cake? Do his folks cook asparagus, green peas, and all other vegetables without melted butter? When he eats butter on his potato, does he always manage to keep the butter unmelted?

Now I'll tell you what I think. I think when he used melted butter as an illustration he supposed he was giving an excellent illustration of the difference between wax unmelted and wax after it had been melted. And so he was. And he also thought that the melting materially injured each article. Prejudice in case of the butter, prejudice in case of the wax. Now if he is allowed to sample a piece of bread on which is spread butter that had once been melted, and another piece spread with butter never melted, I don't believe he could tell which was which. Neither do I believe he could detect any differ-

ence in taste between a piece of comb honey whose wax had all been melted and one whose wax had never been melted. Of course, I assume that the cell walls should be equally thin in each case, the possibility of which he admits.

The *Review* speaks of "comb honey with its delicious, fragile, toothsome, flaky comb." First and last there has been a good deal of that sort of talk, which, carefully analyzed and properly classified, would probably come under the head of nonsense. Comb is fragile, whether made of melted or unmelted wax; but is it "flaky"? I never saw any of it flake apart; did you? Does the pleasure of eating comb honey come from the honey, or is it the wax that is so "delicious, toothsome"? Here's a section of honey that was cut a day or two ago, and cut in such a way that a good part of the liquid has drained out on the plate. Do you find the drained honey on the plate so insipid that you cut some of the comb that now contains no honey, in order to make the honey "toothsome"? Or if you cut off a piece, do you prefer to cut from the part mostly drained so as to have a larger proportion of the "delicious" flavor? Isn't it a little strange that an article that passes through the digestive organs unchanged, and that is not in the slightest degree affected by strong sulphuric acid, should yet be so "delicious, toothsome"?

But after being melted, this delicious, fragile, toothsome, flaky comb is nothing but "tough, leathery, gobby wax." More than that, not content with being an "abomination," as the *Review* puts it, in and of itself, according to *Progressive* it takes unto itself horrors not of its own originating, in passing through commercial centers. It has consorted with "tallow that has been rendered from animals which have died from disease," and "has a lot of this filthy grease adhering to it. When this wax is melted, this filthy grease that adheres to it while coming in contact with sheep pelts that have been skinned from the bodies of sheep that have died of disease, and the filthy tallow and soap-grease aforementioned, will become a part of it."

Now, suppose there are furnished to the bees cells one-fourth or one-half inch deep, and a consumer has read what is said in *Review* and *Progressive*, have you any idea that you can get him to put such comb honey into his mouth? You say, "No, and he ought not to put it into his mouth." Well, then, I go to him and say to him, "I don't use manufactured comb; I just use foundation such as all comb honey generally contains. It's made of the same kind of material as that other fellow's, but there's only half as much of it in a pound, so you'll have to eat only half as much nastiness." Do you suppose he'll buy an ounce more of one than the other?

Now brethren, in all honesty, if the material

used is half as bad as you have painted it, is it right to use comb foundation at all? After we have gone on all these years filling our sections with full-sized sheets, why have you not lifted up your voice against it before? If it was all right to use a certain amount of it, why does the *character* of the material become so very objectionable when it is proposed to double the amount used? If the material is as bad as you say, then let us know it, and let us as honest men use not even the smallest starter in sections.

I am not specially interested in the new product; but along with thousands of others I am interested in the market for comb honey, and I am sorry to say that I believe you have done your share toward striking the heaviest blow at the comb-honey market it has ever received; and this, even if not the slightest change is made in the foundation used. For what you say, if it applies at all, applies to the thinnest foundation that may be made, even without any side walls at all; and let a belief in what you say get a lodgment in the minds of consumers, then good-by to the market for comb honey.

Marengo, Ill.

#### DRAWN COMB DEFINED.

#### DEEP CELLS, AND THE ADVANTAGE OF SHALLOW CELLS.

*Dr. C. C. Miller*:—I believe you are our lexicographer of words pertaining to bees and bee-keeping, and I wish to appeal to you for a definition of "drawn comb." The editor of GLEANINGS, in the Feb. 1st issue, defines: "Drawn; comb—comb that has been leveled down to cells about  $\frac{3}{8}$  of an inch deep." Two other writers, following, seem to agree with this definition. The third writer appears to make a distinction between "drawn comb" and "bait comb." They all refer to *natural* comb made by the bees, and cut down. I don't exactly know how cutting it makes "drawn comb" of it. My idea of "drawn comb" heretofore has been that, when artificial comb foundation was given to the bees, it was drawn out (lengthened) without addition of new wax, or very little of it, and became "drawn comb." If the former definition is correct, what are we to call the last product? Is it proper to call any natural comb "drawn comb"? I have not seen your new dictionary. I have only Webster, and find "drawn butter," but no "drawn honey" nor "drawn comb."

THADDEUS SMITH.

Pelee Island, Ont., Feb. 15.

[Dr. Miller replies:]

I don't assume to be lexicographer for the bee-keeping fraternity, having been chosen to

say in only one book what was the customary usage of bee-keepers. I have some doubts whether I know enough to clearly define "drawn comb." I think I could point to a specimen and say clearly, "That's drawn comb," and then to another, saying without hesitation, "That's comb foundation." But I'm not so sure that I could clearly draw the line between foundation and drawn comb. As the word is ordinarily used, I think all comb is called drawn comb. Ordinary comb foundation is not called comb, but foundation. Give a piece of foundation to the bees, and when they have drawn out the side walls to the depth of  $\frac{1}{4}$  inch we should probably agree in calling it drawn comb, although we would not call it so when they have just commenced nibbling on the side walls. Just at what point to begin calling it drawn comb is something like deciding on what day we are to cease calling a human being a boy and call him a man. I think the term "drawn" generally adds nothing to the meaning, but is used to give emphasis to the distinction between comb and comb foundation. In a super I put a bait of comb, and you can hardly misunderstand that expression; but by way of emphasizing the fact that the bait section contains comb and the other sections only foundation, I say the bait contains "drawn comb." I should say that the term as used by bee-keepers applies to all comb, whether the cells be two inches or more deep or very shallow. You see I'm a little careful to say "very shallow," without giving any exact measurement. I should also say that the term "drawn" has no reference to whether the sample is natural or artificial.

The editorial remark to which you refer is probably the one on page 78, "What I mean by drawn comb is some that had been leveled down to cells about  $\frac{3}{8}$  in. deep." Evidently the editor did not mean that as a definition of the term, but simply as explaining the particular kind of drawn comb used in that case, and exactly the same idea would have been given if he had said, "The drawn comb used had been leveled, etc." If he had meant it for a general definition he would have used "has" instead of "had," saying, "What I mean by drawn comb is that which has been, etc."

Messrs. Crane and Snell, to whom you refer, hardly limit the word to comb with cells only  $\frac{3}{8}$  deep; indeed, Mr. Snell expressly speaks of drawn comb  $1\frac{1}{2}$  inches thick—that is, having cells  $\frac{3}{8}$  inch deep. Mr. Crane thinks drawn combs should not be used with cells more than  $\frac{3}{8}$  deep, but that does not say they would not be drawn comb before cutting down. Mr. Schæffle makes a distinction between "drawn comb" and "bait comb" in the heading of his article, but I suspect that heading was written by the editor. Between the two I think there is no possible distinction as to kind. Every

bait comb is drawn comb, and every drawn comb may be used as bait. But there is a distinct difference as to use, and I suppose this difference was in mind in writing the heading. Every drawn comb may be used as bait comb; but unless so used it would not be bait comb.

I may remark, in passing, that, while I should prefer bait combs with cells deeper than  $\frac{3}{8}$  of an inch, I should not want them as deep as Mr. Snell says,  $\frac{3}{4}$  of an inch. From past experience I should expect them to be built more or less to the separators, unless used in sections more than two inches wide. C. C. MILLER.

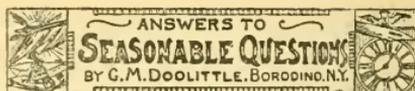

Marengo, Ill.

[Dr. Miller is right in explaining that drawn combs  $\frac{3}{8}$  deep referred to a particular kind to which attention was drawn. I did not intend to give a general definition. I think Mr. Crane is nearly right in saying that in any case "drawn combs should not be used more than  $\frac{3}{8}$  inch deep." To use them deeper would make an inferior grade of comb honey. Before beekeepers learned that unfinished sections could be leveled down *a la* Taylor, and make as good comb honey as that built from foundation, they had come to regard unfinished sections as unfit for use to put back into the super except for bait. Years ago, when the question of unfinished sections in supers was talked over, it was generally concluded that comb honey was of second quality, and that in the end it did not pay. We did not then know that the trouble lay in the full depth of cells. We have since learned that reducing those cells by means of a hot knife or hot plate to somewhere about  $\frac{3}{8}$  inch deep, and then putting all such sections back into the super again, not only produces a first-class article of comb honey, but that the supers are filled much more rapidly than in poor seasons.

Mr. Weid found that it was possible to make the drawn foundation full depth if necessary; and to illustrate the possibilities of deep cells, his first set of dies showed cell walls nearly full depth; but later on he came to the conclusion that such depth was entirely unnecessary.

For the purpose of avoiding confusion, the A. I. Root Co. decided to call the new product "drawn foundation," which, indeed, it is. To call it deep cell-wall foundation might cause confusion, because we have for years made foundation on the old foundation-mills that was nearly  $\frac{1}{2}$  inch thick; but we never supplied such foundation to our trade, as Americans did not care to pay the price for so much wax. But our customers in Germany have very often sent in specifications for deep-cell-wall mills. For the purpose, then, of avoiding confusion, we called the new product "drawn foundation;" the German foundation, "deep-cell-wall foundation;" and combs drawn out by bees, but leveled down, "drawn comb." As it will be found to be impracticable to use any other than combs leveled down, only this article would be used in the discussion. In the multiplicity of terms we must be careful at the outset to use short ones as well as those that are descriptive.

To sum up, then, the different grades of foundation, we have the "thin" and "extra thin;" the "light brood" and the "medium" (the old "heavy" having been discarded); in Germany, the "deep cell-wall foundation;" in this country, "drawn foundation;" for comb drawn out by the bees, but afterward leveled down, "drawn comb."—Ed.]

#### INCREASE AND EXTRACTED HONEY.

*Question.*—Which is the better plan when working an apiary for extracted honey—to make the increase by natural swarming or by division? If by division, when is the best time to do it in latitude about forty-one, white clover being the main plant giving surplus?

*Answer.*—My favorite mode of increase is by natural swarming; and as a general rule I prefer such increase for the reason that I have found that colonies made by division lose much more time getting ready for work than do the bees when permitted to follow the natural laws of increase. But there are exceptions to all general rules, and this is one of these exceptions. Should we desire, ever so badly, increase by natural swarming, it would be very little we should get if the colonies were worked to the best advantage for extracted honey. A good yield of extracted honey is obtained only by providing the colony with an extra set, or more, of empty combs, putting the same in upper stories at the beginning of the honey-flow, or as soon as the bees have increased sufficiently to receive them without any detriment to their building up the most quickly. Bees do not swarm until the hive is well populated and honey coming in from the fields; hence if we put on combs as above (and we must to secure the best results in extracted honey), these combs go on before any preparation for swarming has been made. Ernest Root never uttered a truer saying than he made when he said that "plenty of empty combs is the best preventive for swarming," and by fixing our bees as we are obliged to to secure the best results, we very nearly if not quite prevent all increase of a natural kind.

In all of my experience with the extractor I have never had a single colony cast a swarm before the honey harvest was beginning to wane; and not ten per cent of the colonies thus worked ever offered to cast a swarm at all. Hence we see, if we wish increase, it must be done in some way other than natural swarming, or we must sacrifice our honey crop quite largely by not putting on the combs till the colonies have swarmed. Hence we have increase by division, where increase is wished, as the only way when working for extracted honey.

Having decided this question, the next thing which confronts us is, "When is that division to be made?" Very many of our most practical apiarists tell us that, where we make increase by division, this should be done a little before the honey harvest, or at its commencement. The *why* of such advice, I have never been able to understand. It is argued that,

after the division, you would have two queens laying instead of one; and in this there is great gain. But such reasoning as this is mysterious to me, for the bees which hatch from those eggs laid by the two queens after the division can never become honey-gatherers in the white clover-honey harvest, unless said harvest is much more prolonged than it ever is here; so the bees raised from the eggs of the extra queen will only become consumers, without adding one iota to our crop of honey. Yea, more: instead of adding to the crop of honey it will lessen that crop by just the amount that it will take to feed and nurse the brood and the young bees after hatching, which is a clear loss to us.

Then, again, all admit that one *strong* colony will store far more honey when kept together, it not having the swarming fever, than the same colony would if divided and placed in two separate hives, thus making two weak colonies of it. Hence, by dividing at the commencement of the honey harvest, or a little before, we have two weak colonies to do the gathering, up to about the time the harvest closes, instead of the one very strong one; while after-results from fall flowers are no better for an increase at this time. Still again: By such division we shall have many combs from half to three-fourths full of honey to extract from during the season or at the end thereof, instead of little if any more than half the number of chockful combs which will yield bountifully of honey every time we put them in the extractor. Hence we have very much more work in the extracting arising from this division, just before the honey harvest.

For these reasons my plan has been to work the colonies as above given till very near, or just at the close of the harvest, when I go to work and make what increase I wish, by dividing as many of the colonies as I wish increase.

If any happen to swarm near the close of the honey harvest, or at any time during the latter part of the same, I accept their increase as far as they do so, thus lessening the number desired, according to the number which swarm. About ten days before the honey harvest will naturally close, I start queen-cells in upper stories (the colonies thus used for cells should have a queen-excluding honey-board between the stories), according to the plan given in "Scientific Queen-rearing," to the needed number, these queen-cells being built without any detriment to our honey crop, as the old queen is still doing duty below; and when these cells are ripe I proceed to divide the required number of colonies by an equal division of brood, bees, and combs, allowing the old queen to remain on the old stand, and giving the nearly mature cell to the part removed, twenty-four hours after removal, when they will readily accept the same without using any precaution against the

bees tearing the cell open and destroying the young queen.

If queen excluders are used between the two stories of each colony, as I think it well pays to do, then I like this plan a little better: Four days before I expect to make the division I go to the hive and raise the more nearly mature brood to the upper story; and if I see the queen I leave her below; but I take no special pains to look for her. At the end of the four days I take a look at the combs; and if the queen is in the upper story it will be revealed by there being eggs in the combs. If there are no eggs found I insert a queen-cell and let the hive stand as it is till near sunset, when I take off the upper story and carry it to where I wish it to stand, and the division is made. If eggs are found I hunt out the queen and let her run in at the entrance below, and at night carry the upper story to a new stand, giving the cell 24 hours later, as I did by the first plan, as the bees having a queen in this upper story would be likely to destroy the cell if no precaution is taken. If I do not readily find the queen, where one happens to be in an upper story, I either shake off the bees in front of the entrance to the lower hive, or shake the bees off their combs into the upper hive, smoking the bees down through the queen-excluder, when the queen will be easily found trying to get through the zinc. If I wish to catch the queen I use the latter way; but if I only wish to have her in the lower story, the first is the more quickly accomplished.

---

PETTIT'S METHOD OF PRODUCING COMB HONEY;  
PERFORATED FOLLOWERS.

Will you kindly refer back to page 53 of the present volume of GLEANINGS to that part of the article by Mr. S. T. Pettit, beginning, "But there is another new and valuable feature to be described"? Read to the end, and I think you will conclude, as I have, that Mr. Pettit expresses it well when he speaks of this feature as "new and valuable." I have scanned closely all articles in GLEANINGS and the *Amer. Bee Journal* for a good many years; but, so far as I can remember, this is the first time this simple but practicable idea has been placed before the bee-keeping fraternity. The more I think of this suggestion the more it grows in importance, until I feel impelled to revert your attention to its sterling worth. Not only so, but, original and weighty as this feature appears, I was somewhat disappointed to find that, in your footnote, you failed to give it even a passing notice. But what is this new feature? If I

understand Mr. Pettit aright, it is simply a thin piece of perforated wood, the size of an ordinary separator, placed on the outside row of sections, and a bee-space from the side of the super, held thus by  $\frac{1}{4}$ -inch strips. This "divider" admits of two bee-spaces and the clustering of the bees therein, while the  $\frac{3}{8}$ -inch holes allow of easy access to either side. With this feature applied, the bees will be able to ascend along the sides of the hive from the bottom-board to the top of the uppermost supers.

This device is easily and inexpensively applicable to the dovetailed super. As now arranged, the follower and wedge occupy a half-inch space unused by the bees. By substituting a piece of perforated zinc for the  $\frac{5}{8}$ -in. follower, presto! a bee-space is secured on both sides of the super;  $\frac{1}{4}$ -in. strips,  $4\frac{1}{2}$  in. long, three to a side, one at each end and one in the middle, stood upright, to be used as wedges. So much confidence do I place in the likelihood of this new contrivance enabling the bees to fill and finish the outside of the outside sections in an ordinary flow that I have decided to give it a thorough test the coming season. The long wedge with which to raise the hive and guide the bees, described in the first part of Mr. Pettit's article, is good; but the perforated followers, securing a double bee-space, warmth, clustering, and free communication, while avoiding brace-combs and bulging, is the latest and best. Like many another invaluable idea, it seems so simple, withal, that we are forced to exclaim, "Why didn't I think of that before?" I believe the progressive beekeeper who adopts this happy hint will be a great gainer thereby; and we all owe Mr. Pettit a debt of gratitude for the generous way he has given this advanced idea to the public.

Wadena, Ia., Mar. 12.

GEO. G. SCOTT.

[I noticed the idea of the perforated follower; but as practically the same sort of device had been used before, I did not refer to it particularly. Perforated separators have been used between sections and next to the outside rows with a bee-space on each side of the separator. I can not now point to the page where such is illustrated in our older literature; but our British cousins have long used the arrangement. The only difference, if any, is that the perforated strips were used *between* the rows of sections, as well as on the outsides. But, even if old, this would not in itself make the idea any the less valuable. It struck me, however, that the slanting bottom board has the more important of the two ideas advanced by friend Pettit, and so I referred to it particularly in the footnote. I am glad you have called particular attention to the other idea, as do doubt it needs more emphasizing than it received on page 52.—ED.]

#### HEAT FOR BEE CELLARS.

I see in A B C of Bee Culture that you recommend lamps for heating bee-cellars; but as the physiology says that a common lamp uses as much oxygen as 12 people, I should think enough more ventilation would be required to make up for the extra heat of the lamp. I tried

a lamp in my cellar, and had it well shaded, and a good burner on the lamp; but it seemed to disturb the bees, although there was a door between them and the lamp. This I ascertained by listening through the ventilation-hole on top; and I could smell the gas mixed with the bees' breath. Is there any danger of keeping the cellar too tight if the temperature inside does not go above 35 or 38°?

Galt, Mich., Jan. 5. FRED B. CAVANAGH.

[As Dr. Miller has had more experience than we along these lines I asked him to reply.—ED.]

A lamp or oil-stove should not be used to warm a cellar unless there is some way of carrying off the gases that arise from combustion. A can or jug of hot water is entirely safe provided the water is corked in so tight that no vapor escapes. But if you use a common five-gallon tin can, with boiling water corked tight, it will spoil the can; for when the water cools the sides of the can will cave in—that is, in case the can is only partly filled. If filled *full* there will be no trouble. "Stoves in the cellar have probably done more harm than good," as stated in A B C; but there are those who have had much experience in their use, who insist that the harm has always come from the wrong kind of stoves, as oil-stoves without chimneys, or else wrong use of the right kind of stoves.

There is not often much danger of having a cellar too tight, for there are usually enough cracks and chinks for the air to pass through; but there is danger from cold if your cellar continues from 35 to 38°. Better warm it up some way.

C. C. MILLER.

#### REPORT ON CRIMSON CLOVER IN YORK STATE.

Your report on crimson clover, Mar. 15, reminds me of my own experience with it. I have had it freeze out completely; but last year, the middle or latter part of July I sowed a piece of it with buckwheat, and have to-day as perfect a stand of it as could be desired. The fall was favorable for a good growth, which it made, completely covering the ground, and even in several comparatively wet spots, where it would winter-kill if anywhere, it is growing nicely, and is probably out of danger at this writing, March 22. I think the principal cause of my failure heretofore has been to sow too late, not getting a perfect mat of leaves before winter set in.

C. WECKESSER.

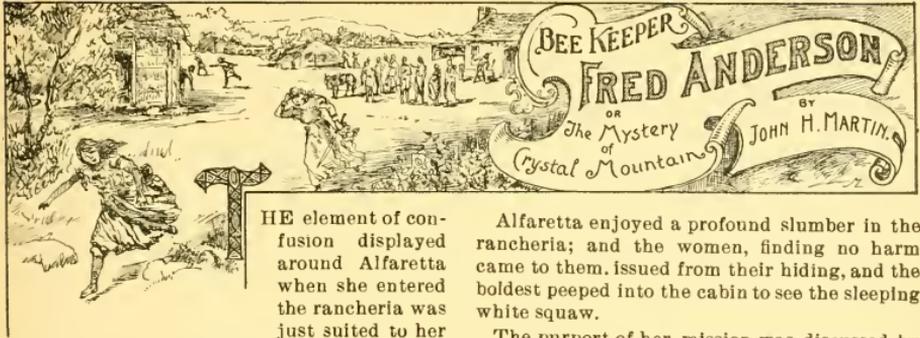

Sanborn, N. Y.

#### DRAWN COMBS AHEAD.

In regard to using drawn combs in boxes I have the best of luck with them. I generally put one-half drawn combs and the other half foundation, and I always find the drawn combs filled first; and I have often wished that full combs could be made for surplus and brood-chamber. I think I should rather pay more for the same.

G. S. BROWN.

Salisbury, Vt., Feb. 19.

HE element of confusion displayed around Alfaretta when she entered the rancheria was just suited to her

mental condition. The people were so different from those she met in her home life, and appeared so frightened, that she hastily dismounted from her pony and gave chase to the nearest squaw; and it is needless to say that the "confusion was worse confounded." There was a stampede of nearly the whole population. In their minds the ancient tradition was about to be verified. The white squaw had arrived, and to snakes they were to be changed. The older men, however, collected in a group and awaited with much show of dignity whatever ordeal might be practiced upon them.

Falling to catch the squaws, Alfaretta approached the group, flirting her riding-whip toward them, shouting, "Shoo, bad men, shoo!"

"We no bad men," said the chief. "We much good Indian. We no kill, no scalp white man; much good, much good Indian."

"You good Indian?" said Alfaretta; "then tell me where is Fred Anderson?"

"Fred Anderson?" said the chief, shaking his head; "him hard case to find. Him way up mountain; you see him some time. Go rest in wickiup, white squaw; we much good Indians."

The idea of rest was a proper one for Alfaretta to entertain. The violent ride and excitement had left her very weary, and a cabin and a cot were gladly accepted, and she was soon fast asleep.

Since Dr. Hayden had been confined so closely to the valley he had instituted a novel mode of communication with the Indians. Upon a prominent point upon the rim of the valley, and on the side nearest the rancheria, he had placed a vigorous colony of bees. This colony sought nectar from the flora outside the valley, and the doctor instructed the young Indians to observe closely their movements; and if he was urgently needed outside the valley they were to dust flour on several bees; or if there was danger threatened, they were to use a red pigment. By a combination of colors the doctor worked out a good signal-code; and upon the afternoon, soon after Alfaretta's arrival, the colors read, "Meet parties at the entrance; danger."

Alfaretta enjoyed a profound slumber in the rancheria; and the women, finding no harm came to them, issued from their hiding, and the boldest peeped into the cabin to see the sleeping white squaw.

The purport of her mission was discussed by the older Indians, and two of the older squaws were delegated to escort her to the valley, while, aside from the telegram over the beeline, two Indians were sent to the valley in the early evening to consult with the doctor. Before the squaws left the rancheria that night the Indians had seen enough of Alfaretta to know her mental condition, and their fear of a few hours previous changed to pity. Their conversation denoted solicitude for her welfare, and that Neo-a-ho-a, their great medicine man, should exorcise the evil spirit that possessed her.

Alfaretta upon her pony, and the two squaws trudging beside her, entered the mountains through a blind canyon a little past midnight. Dr. Hayden, with the two Indians, was awaiting them in an obscure retreat near the great balanced rock that guarded the entrance to the valley.

Gimp Dawson had encountered various episodes in his day's journey, and, but for the contrary of old Jake, he would have overtaken Alfaretta at Covelo. Here Prof. Buell and Joe Splinter found him; and the snarl of questions with which Gimp was trying to tangle the saloon loafers was soon made plain by Prof. Buell, with the result that the man Jim, locally known as Slim Jim, and Pete Armstrong, who made it his business to hunt, with loaded rifle, for the mysterious man of Crystal Mountain, made two more willing additions to the search party, and young Armstrong, after an unsuccessful search at the Indian rancheria, led the party directly to the old cabin in the obscure canyon. Here they camped, and posted their watchers at various points. Gimp, the youngest and the most inexperienced, was posted in a little obscure passage opening nearly behind the big balanced rock, and ending, apparently, among the boulders beyond. "There, youngster," said Slim Jim, "ye can take a nap, for nobody'll disturb ye in there."

All was quiet about the mountain; for in these solitudes, as night deepens, not a chirrup of a bird, the piping of an insect, nor even the rustle of a leaf, is heard.

Gimp sat in the dark, listening to his own heart-beats so long that he became drowsy, and finally fell asleep. Alfaretta was escorted to the valley's entrance through this very intricate and obscure passage. Silently each one of the escort glided along. Dr. Hayden had met them at a point some distance out, and guided their movements. When he found Gimp asleep he stood beside him, motioning the rest to pass. All had entered the dark passage under the rock, and Dr. Hayden was about to leave Gimp when the latter sprang to his feet and was about to shout. The doctor's strong hand was placed over his mouth, and he too was hurried into the passage. But Gimp was strong and active, and, getting advantage of the doctor, he shouted at the top of his voice, "Help! help!" His mouth was this time bandaged, and the great rock fell to its place with a crash, and Gimp was lost to his companions.

They heard the shout, and the crash of the rock; but the keenest search failed to reveal the least trace of poor Gimp.

In the morning Alfaretta's saddle was found half a mile down the valley; but neither Jack nor the rider was to be found.

Prof. Buell's feelings can better be imagined than described, and he was not consoled by the tales of Slim Jim and young Armstrong, for they painted the mysterious man of Crystal Mountain in hideous colors.

For several days the mountain passes were searched as they had never been before. Prof. Buell even essayed to cross that terrible obsidian barrier, but with only one result—deep gashes in his feet and legs. He finally gave up the search, and returned to his home, with a sad heart, but with the hope that is always in the heart of a Christian—that all will be well.

In the morning, when Fred Anderson heard the well-known song, and realized that Alfaretta was in the valley, he quickly sprang down the terrace and was at her side.

"Alfaretta!" said he with deep emotion.

"Ah! this is Fred Anderson," said she; "my mermaids told me where to find you—away, away up the sunny mountain. We will part nevermore—nevermore."

"Oh that she were sane, how gladly would I listen to such a prophecy!" said Fred half aloud. "But, Alfaretta"—but Fred was interrupted by the approach of one of the squaws, who said, "Neo-a-ho a am in cabin. Him feel bad. He no like white squaw. You best see Neo-a-ho a;" and she turned an obsequious attention to Alfaretta, who led the way up the terrace, singing her song and collecting the beautiful flowers that hung in profusion on every hand.

Fred hastened to the doctor's cabin. The latter sat in deep abstraction. He noted not Fred's entrance. Tears were flowing from his eyes.

"Doctor," said Fred, gently; but there was no movement. Fred realized that something of unusual interest was upon the mind of his friend, and he stepped softly out of the cabin again and strolled down to the little stream that ran through the valley. Upon nearing a clump of oaks he heard Sam talking in a consoling way to some one. "Now, honey, you shouldn't cry. You's in de mos beautiful valley in de whole world. See de red posies, de blue posies; see de rocks, de trees, de sparklin' Wis-ton-we; and jus' see me, de brack posy."

"Darn ye and yer posies, yer dirty Injuns an' yer squaws. Le'me go, will yer?" and there was a struggle.

"Why, Gimp Dawson," said Fred, as he hastened through the bushes. "Gimp, you here? Sam, what have you tied that rope around him for?"

"You see, Mister Fred, this young kid wants ter own dis hyar whole valley. He's had more'n forty tantrums this mornin'. I spects he's got to be reconciled."

"LE'ME GO, WILL YER?"

"Well, Sam, take off the rope. Here, Gimp, you know I am your friend. Alfaretta and you and I are all in this valley now, and we must make the best of it until we can get out. Sam is a good fellow, and will treat you well."

"Don't want nuffin' to do with the nigger," said Gimp.

"Don't hurt yer feelin's a callin' me names, honey. Tain't de color ob de skin dat makes de man; it's de actions. But, Mister Fred," said Sam, suddenly, "I wish ye'd go up to de cabin an' rouse de doctor; he eats no breakfas', an' sits a gloamin' an' gloamin'. Dis hyar white gal has a strange effec' upon him. Jes as he was a joicin' about a bachelor's paradise dis gal pops in to spile it."

After giving Gimp some further advice, and telling him to see that no harm came to Alfaretta, he again went to the doctor's cabin.

"Doctor," said he, bruskiy, as he entered, "I see that you have visitors this morning."

"Yes, yes," said the doctor, slowly; "we have visitors, a visitor, and, Fred, do you know the lady in white?"

"Yes, doctor, she is the lady we have talked about so much. Her name is Alfaretta Buell."

"Fred Anderson, you are mistaken. You have been deceived;" and as the doctor arose and paced the floor he said, in terrible earnestness, "Fred Anderson, that young lady's name is Alfaretta Hayden—my long-lost daughter."

"No, doctor," said Fred, with equal earnestness, "you can not mean it. Your daughter, doctor—ha, ha! are we all going crazy? are we dreaming?"

The doctor stepped across the cabin to a little cabinet, and took from an inner recess an old-time ivorytype; "look upon this picture, Fred."

"Alfaretta, for sure," said Fred.

"Alfaretta's mother," replied the doctor. "Now, Fred, sit down. I must talk. Let me tell you the story of my life. I believe I have told you that I was born in Western New York. The farm adjoining ours was owned by my

"LOOK UPON THIS PICTURE, FRED."

uncle, Wm. Bull. His son Clarence was about my age, and we were always fast friends, and were always together until we graduated from college. Our ways parted then for a time. I went to Germany to finish my education in medicine, and he to the far West as a surveyor. The civil war brought us together again—I a surgeon and he in an engineer corps. We escaped the dangers of war, and returned to our paternal homes. We longed for the quietness of home life, and, soon after our return, we both found suitable companions, and settled down to a happy domestic life—Clarence a teacher, and I in the practice of a country physician. Perhaps our lives were too full of joy. Our homes were the scenes of happy gatherings, and the sunshine of love-filled our cozy homes; but in the midst of this happiness

the storm lowered, and in the birth of Alfaretta the life of the one I loved went out. Ah, dear Fred! little do you know of the sorrow in losing one so near and dear as a wife. No more the face greets you at the window; the smile that gave the heart a stronger throb of joy is now only a memory; where there was cheery presence, laughter, song, all is still. In the deep silence of night, in some lonely trying-place, I uplift my clasped hands and cry, 'O lovely spirit! dear one, come and whisper words of love and hope to me; clasp my hand; let me but feel thy presence.' The summer breeze stirs the foliage above me, but there comes no answering word—lonely, so lonely; and when I retrace my steps to that desolate home, an unrest seizes me and I would haste away to the far corners of the earth. The young life that had come into my home under such sad circumstances was taken into the home of my bosom friend, Clarence Bull. Their little Adrietta, after a few months of life, had died, and Alfaretta found a warm welcome there. It is needless for me to tell you that, from the hour of the death of my wife, I became a wanderer. I first went to Mexico, then to Peru. I became a prominent factor in one of their periodic revolutions, and upon the defeat of our party I was sent far into the interior, and for several years had no communication with my distant kindred. When I did return to my old home, things had greatly changed. My cousin Clarence had moved to Denver; thither I went in search of him; but he had left his position there under a cloud—some scandal connected with his school, and no trace of him could be found until I met you. But the changed name misled me. His wife's pride, or perhaps the scandal, led to the change.

"I have had some bitter feelings against him this morning, but I am sure my old-time friend is far too generous to ever deceive me. I shall trust him. But, O my daughter Alfaretta! would that I had not found thee."

The doctor's reflections were suddenly interrupted by a great noise from the terrace above, like the crushing of glass, followed by shrill shouts by the squaws, the agonized braying of a donkey, and Gimp shouting, "She's killed! she's killed! oh she's killed!"

#### ANOTHER DEFUNCT JOURNAL.

Noticing in your January 15th number an article by Dr. C. C. Miller, giving a list of defunct bee-journals, as the subject seems to be of interest to your readers I write to call attention to *The American Bee Gazette*, which started some time in the '60's in New York City, under the management of E. Van Slyck, and, after a few issues, was absorbed by the *American Bee Journal*, of Washington, D. C.

Bellaire, Mich.

ROSSELL LEAVITT.

BEEs appear to have wintered unusually well all over the country, up to this writing; and so far the spring has been favorable.

THE California anti-honey-adulteration law, spoken of in last issue, is already bearing fruit, for, according to the *Pacific Bee Journal*, "The fight is already on, . . . and many arrests have been made." This sounds like business. Let other States follow suit.

THE use of drawn combs in sections, and their value in supers, is being commented on very favorably in the *Review* and in the *American Bee Journal*. By "drawn combs" is meant those that are built wholly by the bees, but have been previously drawn out to catch the honey-flow."

THE new machine for making drawn foundation is now able to turn out samples with cells about  $\frac{1}{16}$  deep, running somewhere about 9 feet to the pound. The base is very much thinner than in that of any sample of foundation that we have hitherto turned out, and the walls themselves are about  $\frac{1}{1000}$  thick— $\frac{1}{1000}$  being the natural thickness. We are at present using only a small portion of the die surface. Later on we hope to make larger samples the same weight.

IN the last *Review*, experimenter Taylor, of the Michigan Experiment Apiary, details his experiments with the Aspinwall non-swarming hive. He has used two of these hives in his apiary for two seasons, and yet he says "the results, so far as determining the true value of its non-swarming quality is concerned, are thus far negative." Elsewhere he states that "swarms from other hives were exceedingly few. The hive is a marvel of ingenuity," he says, "with closed-end frames held compactly together with a screw which works against a movable side." An objection to the hive, he urges, is that it would cost considerably in excess of the regular Langstroth hive; and the present times and low prices and small profit speak too eloquently in the ears of the producer.

Personally I have always liked the appearance of this hive, and it has seemed to me that it contained good features providing it did not make the hive too expensive.

MRS. J. N. HEATER.

IT is with much regret that we announce the sudden death of Mrs. J. N. Heater, of Columbus, Neb.—one of the leading lady bee-keepers of her State, and at the time of her death she

had attained almost national distinction. She was present at the Lincoln convention, and gave us a valuable paper. Mrs. Heater had undergone an operation, which was supposed to have been successful; but it seems the anesthetic—chloroform—was too powerful for her. She was an earnest Christian woman, and at the time of her death we have no doubt she had placed her hope in Christ Jesus. The manner of her death is told in one of the local papers in this way:

On Friday night, March 12, Mrs. Heater could not sleep; and toward morning Mr. Heater, who was at her bedside, said, "Shall I sing to you? Perhaps it will put you to sleep." The suffering one nodded assent, and Mr. Heater softly sang a favorite song, and she seemed to drop into a gentle sleep; but, alas! the watching husband soon found to his sorrow that it was the sleep of death.

The untimely death of Mrs. Heater reminds us of the very sudden death of another lady almost equally prominent, who was present at the Lincoln convention—Mrs. A. L. Hallenbeck. It will be remembered that she died from the result of injuries received in a runaway, about ten days after the convention.

#### THE MAJESTY OF THE LAW.

JUST as we go to press, the April number of a bee-paper (monthly) is at hand. It is filled almost from cover to cover with articles attacking the new drawn foundation. Some of the writers have not only resorted to gross misrepresentations and ridicule, but have gone so far, in our judgment, as to libel our name and attempt to injure our business. Indirectly, but *very pointedly*, we are referred to as "unprincipled men," "adulterators," and the like. The editor is evidently making the effort of his life to injure our name, reputation, and business. He has written bee-keepers everywhere to secure sympathy. From some of them, as we know, he has received cold comfort in return; and the letters from others he has, of course, published. We have fully explained our course; and any reasonable person knows we do not and would not do any thing to injure the honey business.

One thing is certain—we shall not weary our readers with an extended reply in defense of our name. As to what we shall do further, we have not yet decided. It may not have occurred to some of these writers that they may be rendering themselves as well as the publisher amenable to the law.

#### CHARACTER OF COMBS CONTAINING HONEY; A DISTINCTION IN TERMS.

IN the April 1st issue of the *American Bee Journal* is an article from W. Z. Hutchinson, the last paragraph of which is as follows:

I recently expressed my views regarding the new deep-cell foundation, with which The A. L. Root Co. is experimenting, and have only to add, when such a man as E. R. Root says that the comb resulting from the use of this new foundation is as brittle and "eatable" as natural combs we can only wait—

suspend our judgment until we can try it ourselves. If it should turn out that the use of this product does not debase the comb honey, and it can be produced in commercial quantities at a low price, it is quite likely that it will solve the question of *how* drawn combs should be produced. In the meanwhile we can go on getting drawn combs according to the plans that we know are successful.

Mr. Hutchinson quotes me as saying that the comb resulting from the new foundation is "brittle" and eatable. By the term "brittle" he means the same thing that I do; but it seems to me that brittle is not the correct word. If I am any judge, comb is never brittle when filled with honey. It is only when empty and dried out that it becomes such. I think what Mr. Hutchinson means by "brittle" is flaky; and yet to my mind this gives a wrong notion. Comb containing honey should be soft and yielding, whether natural comb or that made from ordinary foundation or from drawn foundation.

Mr. Hutchinson's position is very fair. We are quite willing to place this whole question before the bar of the future; and if that future shall decide against the new product, even though we have invested a heap of money in it we shall drop it. But the past has most emphatically given its decision in favor of the new drawn foundation.

#### THE NEW UNION AND THE RESULT OF THE ELECTION.

The following report has been received, and will explain itself:

To the Members of the United States Bee-keepers' Union:—We, the Executive Committee, according to the power vested in us by the new Constitution, hereby appoint the following as General Manager and Board of Directors of the United States Bee-keepers' Union, to hold their offices during the remainder of the year 1897, or until their successors are elected and qualified:

GENERAL MANAGER—Hon. Eugene Secor, Forest City, Iowa.  
BOARD OF DIRECTORS—Ernest R. Root, Medina, Ohio; Rev. E. T. Abbott, St. Joseph, Mo.; Dr. C. C. Miller, Marengo, Ill.; W. Z. Hutchinson, Pitt. Mich.; E. Whitcomb, Friend, Neb.; C. F. Daddant, Hamilton, Ill.  
GEORGE W. YORK, PRES.,  
E. WHITCOMB, Vice-Pres.,  
A. B. MASON, Sec.,  
Executive Committee.

Chicago, Ill., April 1, 1897.

[Mr. York, of the *Bee Journal*, comments as follows:]

Now as the United States Bee-keepers' Union is fully equipped as to its officers, we trust that bee-keepers every where will at once send in their dollar membership-fees to the General Manager, Hon. Eugene Secor, Forest City, Iowa, or to the Secretary, Dr. A. B. Mason, Sta. B, Toledo, Ohio, so that there may be ample funds to begin to carry out the objects of the Union, which are expressed in the following paragraph taken from the new Constitution:

ARTICLE II.—OBJECTS.  
Its objects shall be to promote and protect the interests of its members; to defend them in their lawful rights; to enforce laws against the adulteration of honey; to prosecute dishonest honey-commission men; and to advance the pursuit of bee culture in general.

What more do you want? Where is the bee-keeper that doesn't want to help carry out every one of those splendid "objects"? Surely, every bee-keeper in the land will be glad to have his name enrolled as a member of the new Union.

I say amen to every thing that Mr. York has said. Article 2 shows the object of the new organization. Its field is large—very large. Perhaps this season it will not be able to make a very great showing until we can get it on its feet. First of all, we need funds, and that

means a large membership. Those who are anxious to see some of the crooked ways of commission men brought to light, and the glucose evil fought, should plank down their dollars at once. Unless the officers are supported, they can not very well compass much in the lines indicated.

#### THE WILLIAMSON PRODUCE CO.; SANFORD & CO.; COMPLAINTS.

Mr. J. H. HOYT, of Otisco, N. Y., shipped to the Williamson Produce Co., commission merchants, of New York, 2000 pounds—his entire crop—of honey last September. He has their note, but it would appear he will not be able to realize upon it. The Williamson Produce Co. gave as references on their card the name of R. J. Dean & Co., bankers, New York. We wrote to that firm, inquiring about the responsibility of said Williamson Produce Co., and received the following reply:

*The A. I. Root Co.*:—In reply to your letter of March 19, we would say that we never gave the Williamson Produce Co. permission to refer to us. From the complaints that have been coming here, we should say that they are anything but responsible.  
Yours respectfully,

R. J. DEAN & CO.

302 Greenwich St., New York, March 22.

On the 19th of March we wrote to the Williamson people, calling their attention to the complaint of Mr. Hoyt; but as yet we have received no reply. It is possible that they will take up the note; but in the mean time our readers can draw their own conclusions.

In the last *American Bee Journal* there is recorded a complaint regarding the now extinct firm of Sanford & Co., of New York. Complaints have also come to us concerning the same parties. A word to the wise is sufficient.

When will bee-keepers learn not to trust the product of their honest toil to entire strangers? In the first instance, it is possible that Mr. Hoyt was misled by the fact that the Williamson Produce Co. referred to a responsible banking house which he knew. If he had taken pains to write to this house before he shipped his honey he might now have something to show for his year's work with the bees.

A few days ago we received what we *thought* was quite a bad complaint against one of the firms that furnish quotations for GLEANINGS. On referring it to the firm in question we learned that the bee-keeper had sent the honey without orders, as well as some other produce; and the firm wrote us that, if their patron had simply asked for instructions, they would have advised him to hold his produce until they could have found for him a customer in his own vicinity. But, no; our friend, without orders, shipped the produce to the city, at a distance from his own home, where the goods (apples in this case) were a drug on the market, and were actually being dumped by the hundred bushels because there was no sale.

*Moral.*—Do not trust unknown firms, even if they do furnish good references. Write to the references first; and while you are about it write to us too, for we are on the track of nearly all the honey firms. Second, do not ship your honey or any thing else without first receiving orders from the commission house.

#### FOUNDATION WITHOUT SIDE WALLS.

ALLUSION was made in our last issue to the fact that a number of bee-keepers had clubbed together to purchase a foundation-mill that would turn out an article without side walls. Mr. Bingham, in a recent article in the *Review*, in writing of this, says: "While not strictly an invention, it is practically such."

I do not know whether he meant to say that such foundation was new or not; but, if I am correct, the first foundation that was ever made had no side walls. Cheshire, in his "Bees and Bee-keeping," second volume (1887), has a good deal to say about what he calls "artificial midrib;" and in Fig. 48 he shows a wax-press for making the product. One of the earliest patents on foundation, I believe, showed the foundation without the walls. Something like twelve or fifteen years ago we made a mill for W. W. Bliss, then of Duarte, Cal., that turned out a foundation without side walls, running about fifteen feet to the pound—in fact, an almost exact duplicate of that which is turned out on the mill made for the members of the Michigan State Bee-keepers' Convention, the product from which has been so greatly admired by Mr. Bingham and others. The first foundation that was ever made by A. I. Root was from small plates that were an exact counterpart of the midrib without wall. One of these old die-plates was used in the office, as a memento of old days gone by, but serving in the exalted position of a paper-weight. Singularly enough, up till recently it was wont to hold down the piles of orders for the new Weed process foundation.

Artificial midrib, if we adopt the word of Mr. Cheshire, is not a new article; but the mere fact that it has been tried in the past, and seemed to have been forgotten for some reason or other for the regular foundation, is somewhat significant. But many another good thing has been abandoned, which later on has proved to be of value. Possibly this may be true of the article over which a few of the members of the Michigan State Convention were so enthusiastic.

But if it is a light foundation that is wanted, we can make, and, in fact, have made, an extra thin, having side wall, running 15 feet to the pound; and I am not sure but we could make it as light as 18; but the very light grades do not seem to meet with a very favorable reception by the bees nor by their owners.

Mr. Bingham seems to feel that the septum, or midrib, without side walls, would be less liable to sag than that with. To me it would seem as if it were the other way. The grounds for Mr. Bingham's convictions are that a side wall is unnatural, and that, in the effort of the bees to improve it, they fall into all sorts of calamities. These are points that this season's experimenting will very easily settle.

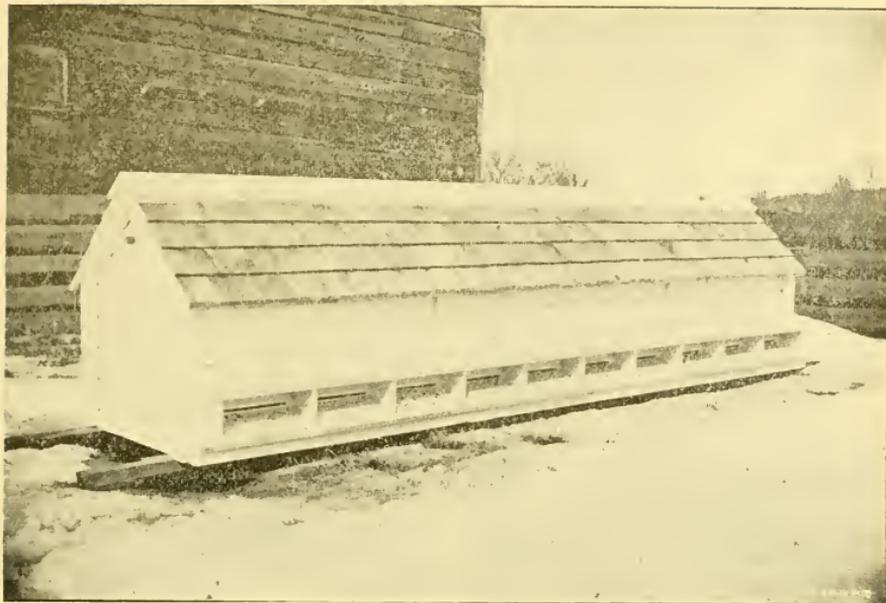

#### THE ORTON TEN COLONY TENEMENT HIVE.

SOME little time ago we received two fine photos of a tenement double-walled hive, and along with them came a short description. This last seems to have been mislaid during the interim in which the engravings were being made. I have been waiting for it to "turn up," but as the subject-matter will soon be out of season I decided to submit it to our readers, without a description, and let the pictures do their own talking.

As will be noticed, it is a double-walled hive made to take ten colonies. The cover easily tilts back on hinges, to permit of the manipulation of the colonies, though I imagine it would be a little cramped in working under the cover. The whole material for making up the hive, including the drop siding, if I remember correctly, was less than \$5.00; and from the pictures almost any one could construct one like it. Of course, he would have to figure out his own dimensions.

One objection to the ordinary tenement hives is that they are unwieldy. As usually constructed they are made to take four colonies. When sufficient space is allowed for packing, it makes the space so large that it will not go into an ordinary wagon. By taking off the wagon-box, and extending the reach, this hive of Mr. Orton's could be skidded up on to the wagon; but as a general rule, after it is onceset down it should stay in that location. Such a hive would be convenient at out-apiaries; and if located in sight of a house, and the cover secured down by means of a padlock, it ought to be reasonably free from the depredations of thieves and heavy winds.

It will be noticed that the upper stories of each brood-section are packed with sawdust or other loose material. By looking very closely you will notice on the back side of the open hive that there is a space for packing-material around the ends of the hives. If there is only thin wood between each brood-nest the two contiguous colonies would be apt to cluster up next to this on account of the warmth. When we kept our tenement hives running, the winter clusters in the four hives were huddled together as closely as possible, and I have no doubt that Mr. Orton finds his colonies have a tendency to cluster in pairs—one on each side of the thin board separating the two colonies.

ORTON'S TENEMENT HIVE, OPEN—REAR VIEW.

## OUR HOMES.

And Joseph gathered corn as the sand of the sea, very much, until he left numbering; for it was without number. . . . And all countries came into Egypt to Joseph for to buy corn; because that the famine was so sore in all lands.—GEN. 41:49, 57.

A few days ago a paper was sent me from Nebraska, with a marked article for me to read. After reading this article my eyes wandered into the next column where there were market reports of the different grains. It read something like this: "Corn in the ear, 10 cts. per bushel." As I read this I concluded it must be for just a bushel basketful of ears of corn; but the next quotation dispelled this delusion, for it read, "Shelled corn, 10 cts. per bushel."

When we were at Lincoln, Nebraska, some of the friends explained that you could buy the shelled corn at about the same price as corn in the ear, because the cobs are worth the cost of shelling, for fuel; and they explained that, where corn is quoted at so much in the ear, out west, it means enough ears of corn to make a bushel shelled. A whole bushel of shelled corn for only 10 cents! Six pounds of one of the most nutritious and sustaining foods that the world ever saw, for just one cent! No wonder our farming friends felt blue and discouraged. And then I wondered why they did not stop raising corn until the price went up a little; but I went on reading the market reports, and I found oats per bushel, 12 cts.; rye, per bushel—I do not now remember exactly whether it was 30, 35, or 40 cts., but it certainly was a ridiculously low figure. How can farmers go on and prepare their ground and put in their crops with old corn standing around wanting a purchaser, at only 10 cts. a bushel? Why, it seems to me they can not do it. Things are coming to a standstill. Farmers can not buy books and papers, nor even hives and garden seeds. They can not go to the store and trade. They can not even afford postage-stamps, let alone nickels, unless something is done for their relief.

Now, please do not worry, friends, and fear that A. I. Root is losing his faith in God and God's plans. If I were losing faith I would not be writing these Home Papers; for it was faith in God and faith in my fellow-men that first started me; and God will give me faith—and at least a degree of wisdom, I am sure, to discuss some of these social problems. Something must be done, and done right speedily, to take this corn that is at present, as in the language of our text, "as the sand of the sea." I do not know but the friends out west have left off numbering, as Joseph did, because the quantity is so great, and nobody to purchase it. In the latter verse of our text, please notice that "all the countries came into Egypt for to buy corn, because the famine was so sore." Is it a famine that is needed? Well, we certainly need not pray that God may send a famine, for already there are millions starving, and millions that will die unless this corn is carried to them. In the last issue of the Chicago *Advance* we are informed that a company has been formed, and a great steamship line has volunteered to move the corn from our Western States right to the sufferers in India, free of charge. One of the great problems in the matter—in fact, I might say the great problem—has thus already been solved—the cost of moving the corn to the sufferers. May God be praised for this much. In the article I have alluded to in the *Advance*, so far as I can gather, the impression was left that the farmers out west should contribute the corn free of charge. They can get only 10 cts. a bushel for it any way, and they might as well

give it away to get rid of it. That seemed to be the impression left, but perhaps I am mistaken. At any rate, I wish to make a little protest right here against asking the average farmer to give *any* thing. If he sells the corn at 10 cts. a bushel, or something like that price, he has done enough. Let the rest of the world—the moneyed world—pay him this small price for his corn. It need not be an act of charity; for if the West can not be set to work raising more crops, we are going to suffer, each and all of us. The manufacturers of the world, and, in fact, the merchants of the world, depend, either directly or indirectly, upon the farming people for customers. We shall surely come to grief, all of us, if we do not remember with kindly feelings the people who till the soil and raise the crops. I do not believe that business men, as a rule, are at the present time inclined to look down upon the farmer. There may be a certain class of dudes and a certain line of aristocracy who have a foolish sort of pride in thinking they do not have to work down in the dirt, as the farmer does. These people are not worth noticing, and some of them, at least, end their days in poorhouses and asylums. I have seen this sort of retribution. As a rule our people have respect for the tillers of the soil. Our great cities are obliged to bring in boys and girls from the country, to do their work with both brain and muscle.

The farmer does not ask for charity from the merchants and manufacturers. He would not take it, for he has at least a wholesome degree of pride; but he does ask that, from motives of self-protection and common interest, he be remembered. It is certainly to our interest to turn in and help him dispose of his crops. The United States of America can, if it wakes up, raise enough money in 24 hours to relieve our farmers of their surplus grain, and set them going on their ways rejoicing, and at the same time feed the starving brothers and sisters across the water, and set them also to rejoicing. Just look into the matter, and read the letters from the hard-working missionaries in our foreign fields. And this work need not be altogether "cross-bearing" either. The man who contributes till he feels it, feels happier, and is prospered in every way a hundred times more than the miser who gets all he can and keeps all he gets.

Why, dear friends, we can not even enjoy a good dinner without making some sort of sacrifice for it. My good friend and dear brother the Rev. A. T. Reed, who is riding that "evangelistic wheel," took dinner with us yesterday. He had been having one of his first wheel-rides for the season; and while enjoying his dinner he told me that no one could believe, until he had tried wheel-riding, what a keen zest and enjoyment it gives one for his food. It gives such an appetite that even the plainest food becomes delicious. Some of you know about this. Surely there is no excellence without great labor; and this may apply to a dinner as well as to literature and mechanical work. The man of wealth can not enjoy the good things of this world and life in general unless both he and his capital are doing *work* of some kind. Why, dear friends, you all know that *money* does not make a man happy. There have been several reports of millionaires who committed suicide; and only yesterday I read of a man who put an end to his life, who was worth something like four millions. Had that man gone west and bought corn, to be shipped to the starving people in India, he would have been so happy that no thought of throwing away his life would have entered his head. If he had learned to ride a wheel, and had then

gone around among the farmers on the wheel, giving them checks for the contents of their corn-cribs, I think he would have enjoyed a good dinner of corn-meal mush and maple molasses as he had never *dreamed* of enjoying a dinner before.\*

Now, friends, there are probably not many millionaires who read GLEANINGS. There may be a few—I do not know. If there are, may God's Holy Spirit bless this little message, and make it bear fruit; and even if you are not a millionaire, may you catch the inspiration from the Holy Spirit, and cast your mite into the fund to move these great masses of corn, that is like the sand of the seashore, to where it will do good. Won't it make you happier to put off buying something you had planned to buy, and give at least a part of your possessions to the Lord? You see, there are three birds to be killed with one stone: First, the saving of precious human life; second, relieving the farmers, and setting them at work rejoicing; third (I put it last because it comes the nearest to self), open the way for prosperity in your own business by helping your brothers both east and west. Why, bless you, it will not be *lost*. In this short life of mine I have many times thrown money away, as some people would look at it—yes, as some of my friends have said—but it was really, however, casting my bread upon the waters; and in many days this bread so cast forth for Christ Jesus' sake has come back with renewed and *wonderful* interest. You can not think how cheering and encouraging it has been while off on my travels to find that I had, away back, helped to benefit somebody, and had forgotten all about it. I need not tell you of these things, because it would seem like boasting; but the very fact that our business has prospered is owing very much indeed to occasions where I had forgotten business, as it were, and contributed sometimes pretty heavily to demands from foreign fields. Ever since I became a Christian I have given heavily to the cause of missions—many times when I was paying interest on borrowed money to do it; and again and again has business come along in some unexpected and unheard-of way because I had years before listened to the call and promptings of God's Holy Spirit rather than to heed the promptings of selfishness.

Perhaps there are many among the readers of GLEANINGS who really can not give very much consistently. If so, then let them give a little trifle and back it up with earnest prayers that God may move the hearts of men during this beautiful springtime.

It is not only in suffering India just now, but within the past few days the floods in the South have been so severe that great quantities of corn and other things will be needed there as well, in all probability. Even as I write, an organization has been formed, and the President of the United States has been asked to give governmental aid. Now, let us spring forward as we did during the Chicago fire, and later during the Johnstown disaster, and let these suffering friends know that at least we, who profess to be a Christian nation, do love our neighbors. Even if we do not quite come up to the scripture injunction to love them as well as ourselves, let us show that we have regard for those who have lost their homes and their farms through no fault of their own, but rather through a wonderful dispensation of Providence which we can not just now under-

stand. I do believe good is coming out of it all, and I rejoice that as yet there has been so little loss of life. Let me digress again just a little:

House-breaking and highway robbery have been worse during the past year or two than perhaps ever before in the United States. This matter of "holding up" and taking a man's money is now getting to be alarming. It is said that even the boys are practicing it. There seems to be a sort of wave, or, as some would call it, a "fad" to take a man's money away from him by force. God forbid that this craze or fad should go any further. Is it not possible that, in God's providence, it may be counteracted by another and a *greater* wave in the line of the little text which says, "Do good, and lend, hoping for nothing again"? and may not this wave be so great as to throw accounts of prize-fighting into the background? May it not sweep away and blot out the cigarette business? May wholesome activities in the way of benevolences toward our fellow-men crowd out selfishness and brutality! May the Lord bless and help in this work that comes just now before our beloved United States of America!

It seems a little funny, but just now the very best recommend that the Anti-saloon League of Ohio has ever heard from any source comes straight from our enemies. May the Lord be praised for such testimony as they have seen fit to give *publicly* and *in print*.

The following is an extract from the *Wine and Spirit News*, official organ of the Ohio State League, of Feb. 24, 1897:

□ You are scarcely aware of the activity of the Anti-saloon League. It is but little over three years old, and yet in that brief time it has accomplished more than any organization ever formed in a similar time. The first year it held 2000 meetings. The second year it held 6000 meetings, and the third year 12,000 meetings were held in the State of Ohio. In all, the officers and members of this league have slandered your business and my business in the presence of 300,000 people in the three years, or at the rate of 100,000 every year. The highest number of saloons in this State at one time was over 13,000; now the total number has been reduced to less than 9000. The Anti-saloon League has reduced the number within the last year and a half 1500. In the same length of time they championed a bill in the legislature that would make sixty counties of this State vote "dry" at the very next election, which would have been this spring; and, what is more amazing still, they actually secured fifty votes in favor of its passage. Two years have almost gone by, and we are face to face with the same issue again. The same enemy is again in the field, better equipped, with more men and more supplies than he was when the Haskell bill was defeated in the last General Assembly by the narrow margin of seven votes. Our duty, therefore, as business men, engaged in the liquor-traffic in this State, ought to be plain. We must fight fire with fire.

□ On page 26, Jan. 1, I told you I was getting in training for an expedition of 280 miles overland to the Grand Canyon. A little more than half this distance had been made. When we were at Robert Phinney's, up in the mountains, we were about 30 miles from Flagstaff; and Flagstaff is about 75 miles from the Grand Canyon. Our trip of 150 miles or more overland had been gradually ascending. The city of Phoenix is but a little above the level of the sea, with its

\* May I digress just a minute to say that the corn-meal mush should be boiled at least four hours as we do the wheat and rye ?

mild temperature. At Campe Verde we rode it is almost a mile above the sea-level. There was considerable frost every night, and the mountains were more or less covered with snow. Before reaching the Grand Canyon I must go almost a mile more, nearly straight up. I was told everywhere that it was a dangerous trip to take in winter; and the cool nights and the raw northeast winds had begun somewhat to affect my health. Very reluctantly I gave up the undertaking until at a warmer season of the year. You see, as we got up in altitude the weather was colder and colder; and when nearing the Grand Canyon there is considerable danger of being snowed under; and this, in a locality that is almost entirely uninhabited, would be risky and dangerous. Rather sadly we turned our horses from the well-beaten road, and headed toward the Jerome gold-mines. The locality of this mining town was plainly visible from the crest of every hill by the volumes of black smoke that seemed to surround and envelop the neighborhood. Down into the valley we went over a very pretty and romantic road until we crossed again the Verde River. Then began our gradual ascent over a good road up toward the mines. The road was so fine I tried my wheel, and rode several miles. Finally I stopped to rest. As my companions came up I said:

"Why, I do not see what makes me get so tired. I have had a beautiful road; and although I have not ridden more than about two miles, it really seems as if I hadn't strength to go any further."

This remark was greeted with a laugh from my comrades on the wagon. One of them said:

"Why, Mr. Root, instead of two miles you have made six or seven, and, besides this, going up hill at a tremendous rate pretty much every foot of the way. We are now within a few miles of the great incline that takes us up to the city. By all means, get on and ride, and get rested enough so you will be able to foot it up the great hill."

It began to be evident, as we came nearer and nearer, that we were getting into the suburbs of a town of some sort. The dwellings were better, and there were slight evidences of wealth on every side. At a most romantic notch in the mountains we came in view of the incline. Said I:

"Why, you do not mean that the horses and wagons go up that hill?"

"Indeed they do, and carry heavy loads too, as you will presently see."

Our ponies were watered, and the sagacious animals looked anxiously up at the task that lay before them. The road was so hard and smooth it was not so very hard after all; but it was a terribly long pull, not only on the horses, but our whole crowd were puffing and panting as we reached a turn that gave us the first glimpse of the city. Jerome is built on the side of a cliff. I think it has between one and two thousand inhabitants. The dwellings are notched into the side of the mountains all along. The streets are necessarily very narrow, for one side must be cut into the rocky mountain side, while the other is built out by a wall. The houses are so much one above another that you can not only look down your neighbor's chimney, but many times you could easily jump down, or at least it would almost seem so. There is one single church in the town, built by the Baptists; and I verily believe it cost about as much to put up a structure of timbers to hold the projecting edge of the building as to make the building itself. Every house has one edge jutting into the rocky mountain side; then the other is propped on a

stone wall or on timbers. There is only one street in the town wide enough for a wagon. The others are mere walks, or walks wide enough to accommodate a burro. Said burros deliver provisions, fuel, and every thing else. Instead of having streets go up and down the mountain, they have an endless amount of stairways. The town is supplied with electric lights, and waterworks. There is not any sewage at present, and it may be a little difficult to manage it; for slops and rain water will go straight down hill any way. The tank that supplies the town with water is a hundred feet or more above it; in fact, it is so high up that it looks like a good-sized barrel; but it really holds enough for all purposes.

It was toward dusk when we got in, and before reaching the residence of my good friend F. E. Jordan I caught a glimpse of the wonderful pyrotechnic displays that can always be seen day and night. Great tubs of melted slag are constantly being poured out over the cliff as they are carted out from the great Jerome gold and copper mines. In fact, the company is constantly making a level platform on the edge of the mountain, with the molten slag. A guard is placed around the melted lava (as I should call it), so that it cools on a perfect level, hard and smooth as ice, and as firm as the rocks. More slag is then poured over the edge of the cliff until it accumulates for a groundwork, and the floor thus laid is used for building out the constantly increasing works of the mining company.

My friend Jordan used to be a bee-keeper at Camp Verde. He has taken GLEANINGS many years, and bought goods of us until he feels perfectly well acquainted. He occupies a very pretty little cottage, one of the three latest built, and almost the highest up in the town of Jerome. Within his beautiful home we found quite a contrast to camping out in the desert. After supper he kindly piloted us over the works of the great mining company. It is impossible to do any thing like justice here on paper, but I will try to give you a little sketch of it.

Years ago a mining company located here and dug out a small quantity of copper ore containing some gold. They supposed they had exhausted the mine, and it was entirely or partly abandoned. This new company, by going a few feet further into the mountains, discovered endless quantities of copper ore—I think some of it going as high as 75 or 80 per cent pure copper. A shaft was sunk down 500 feet or more, and they found ores in paying quantities clear to the bottom. Out of this shaft drifts were led out at different levels. The ore is mined, and placed on cars which are run up to the bottom of the shaft, then it is elevated to a room level with the mines. The cars run right up the elevator, and the contents are then pushed off into the melting-furnaces. The ores, with the proper materials, are dumped into a huge cupola, similar to that used for melting iron. This is mixed with a sufficient quantity of coke, and by the assistance of a tremendous blast of air the whole is raised to such a great heat that the metals run out. This melted metal is conducted into a great pot or crucible. These pots are large enough—well, I think some of them would accommodate a good-sized family, tea-table and all. By means of a powerful crane, operated by electricity, these great caldrons of seething metal are tipped up as one would tip a coffee-pot, and the contents poured into brick-shaped molds. These bricks of copper ingots contain more or less gold; but none of the workmen, nor anybody but the assayer,

knows any thing about it positively. While they are pouring out the melted metal you will notice a man with a little ladle about the size of a teacup. He keeps dipping this in for a sample, as it were. These samples are given to the assayer, so that the company has at least some knowledge of the value of the metal they are mining and shipping every day. The works run day and night, week days and Sundays as well. There is no stopping.\*

After we were tired of exploring this wonderful industrial plant away off in the wilderness of Arizona, we rested from our labors (climbing up and down), and waited until next morning.

At this point I was reluctantly obliged to bid adieu to my good friends Elvey and Carey, who had been with me so long. They said that, with the bad cold I had, I must not undertake to go home by the route we came; and it is well I did not, for they encountered some storms on the way that would have been at least a little trying to a "tenderfoot." My good friend Jordan got off from duty during the afternoon, and we had a rare time in exploring by daylight.

I said the ores were taken from the mine and dumped into the furnace. This is true of only a part of them. The greater part are run out of the drifts on cars along the track that runs around the mountain-side on a dead level. All along this track are heaps of roasting ore. The ore (sulphuret of copper) is piled up with alternate layers of wood. When the wood is ignited the ore contains sulphur enough to keep it burning. In fact, sometimes the sulphur runs out and runs around loose. I suppose there is not demand enough for it at the Jerome mines so that it would pay for refining and sending to market. This roasting process is in order to get rid of the sulphur and other waste products if I am correct. The fumes of the burning sulphur are so strong that no plant, tree, shrub, or bush can live near or around the town of Jerome. Mrs. Jordan told me that some of the women brought house-plants, and kept them alive for a certain length of time; but when the wind changed so as to blow the sulphur fumes the right way, every thing in the way of vegetable life gave it up. The first inquiry a stranger makes is whether or not these sulphur fumes are unwholesome. Well, the people claim they are not. How nice it is that folks should be so loyal to their own town and climate! My companion told me that people suffering from catarrh or throat troubles were found to be greatly benefited. I remembered then that our good friend E. T. Abbott, of St. Joseph, Mo., when talking at farmers' institutes, recommended sulphur fumes for curing poultry of the roup. I heard him remark that, if you had a very bad cold, nothing would give you relief quicker than to inhale the fumes of the sulphurous acid while you are treating the poultry. I remembered, too, I took particular pains to see what effect it had on my cold, and I was obliged to confess that it gave at least temporary relief. I am inclined to think the fumes of burning sulphur are not necessarily deleterious.

Well, one of the most wonderful things about the Jerome gold-mine is a spring of water that runs out in considerable quantity from the lower drift. The water runs out beside the

\*The machinery and fixtures of this mine are said to have cost about a million of dollars; and the company claims that there is ore enough now in sight to keep them at work for the next fifty years. An English syndicate that talked about buying them out was told that no proposition could be considered short of about *sixty millions of dollars*. I shall have more to tell you about this copper-mine in our next issue.

track. It is carried into a wooden flume something like the irrigating-flumes; and this wooden flume runs along the mountain side pretty nearly level for a mile or more. The flume is perhaps ten or twelve feet wide, and the water in the bottom is several inches deep. Now, on the bottom of this flume they have laid all sorts of pieces of refuse old iron. The water from this spring from the mine is considerably impregnated with sulphate of copper, or blue vitriol, as it is generally called. Perhaps many of our friends have observed that, when they dip a bright piece of iron or steel—say a knife-blade—into a solution of sulphate of copper, the blade soon becomes coated or plated with copper. When you are spraying fruit-trees with the copper sulphate, you may have noticed this. The explanation is that the sulphuric acid has a stronger liking for the iron than for the copper; so it lets go of the copper, as it were, and grasps hold of the iron, which is an easy solvent. The copper must go somewhere, so it is left on the surface of the iron. Cast-iron articles are often copper-coated by this means. Well, at this Jerome mine the copper is held in solution in such quantities that the iron causes it to drop the copper, not only all over the iron articles, but even on the bottom of the wooden flume. Every little while this loose mass of copper dust or mud is shoveled up. When they get a carload or more it is melted down, and it gives ingots of almost pure copper. Strangely enough—at least it was strange to me—this precipitated copper *also* contains a percentage of gold; and my friends told me that a sharp Yankee down by the Verde River had commenced speculating on his own hook by precipitating an additional quantity of copper from Copper Creek after the Jerome mine had got through with it and let it go to waste. Before the mine was ever discovered, people knew this spring and called it Bitter Spring because no man or animal could drink the water. Now this spring yields a mint of money when you get it out, by chunks of old iron, in the way I have described. Of course, there is a great deal I did not understand at all about the Jerome mine; and even Mr. Jordan himself could not enlighten me on all points. For instance, when I was in the jewelry business (years ago) I learned chemistry enough so that I could extract all the gold, by means of acids, from old jewelry of any sort. This was done by dissolving out the cheaper and baser metals by acids, and recovering the gold by quicksilver. Now, then, if 100 lbs. of copper contains one ounce of gold, how do the folks at the mint, or other metallurgists, get this one ounce of gold and save the copper also? Surely they do not dissolve this quantity of copper in acids, then precipitate it and restore it to its metallic state. If I understand chemistry, this would cost ever so much more than the copper is worth. Can any of our readers enlighten us on this point?

A word about gold-mining. Almost every man in Arizona (and perhaps a good many women and children besides) has been more or less affected at different periods in his life by the gold-mining mania. People are prospecting everywhere, sending samples to the assayers, taking out claims, and selling their chances on said claims. One night by the camp-fire an old miner told me that it was his opinion there were not more than a dozen gold-mines in the whole of Arizona that were really paying expenses. He said, furthermore, that not one of a thousand of the prospecting miners succeeds in making even day's wages, counting all the time they spend at the business. At one point in our travels Mr. Elvey pointed out a mountain-side where he said he had on a for-

mer trip seen a dozen men hunting over the gullies and ravines after a heavy rain, to find the precious metallic gold that had been washed out by the storm. I asked him if he did not think it likely that I might find just a *little bit* of gold if I went on foot up some of the dry canyons while the horses were climbing some of the hills. He said it was possible, but he did not think it very probable. Off I started. He told me the gold, being so heavy, it would be clear down to the bottom, under every thing else; and sometimes a little nugget would get stuck in a narrow crevice in the rock, right in the bottom of the run. I soon became full of enthusiasm, and pictured to myself holding up a nugget the size of a small hen's egg, and telling my friends that I myself picked that out of the ravine while I was off on that ride to the Grand Canyon. As I got tired a little I thought a lump of gold the size of a *hickorynut* would have satisfied me very well; then a little later I concluded I would go home satisfied if I could get a piece as large as a pea. Finally I fished my spectacles out of my pocket, and concluded I would try very hard to be satisfied if I could only show to the admiring ones at home a piece of gold of *any size* that I found in the mountains. When I was about tired out I discovered the wagon was waiting. As I reached my friends, panting from my exertions, I announced my convictions something as follows:

"Look here, friends, I have looked everywhere, and worked hard, and I have not been able to find a piece of gold even as large as a pinhead, and I have spent as much as *twenty or thirty minutes* of time, and looked very sharp. I believe I shall hereafter try to make my money in some other way."

They greeted my announcement with a great deal of pleasantry, especially when they remembered my sudden enthusiasm for gold-hunting, and how quickly it had vanished.

#### BUFFALO BERRY, HIGH-BUSH CRANBERRY, ETC.

I do not know but I shall have to take back some of my severe strictures in regard to a few of these small fruits. High-bush cranberry certainly was not fit to eat last fall; but after the fruit had remained on the bushes all winter, looking very pretty and ornamental, I found the bitter taste had largely disappeared, and along the last of March Mrs. Root made some jelly or marmalade of some of the berries, that was to me quite delicious and wholesome. Why didn't the nurserymen tell us that the fruit should be left on the bushes all winter, and made into some sauce in the spring? The buffalo berry this year was in bloom the first of April—in fact, before the bush had leaves on. If it comes any thing near being equal to *Eleagnus longipes*, I should be much pleased. Another thing that gives me courage is my Logan berries. These have wintered over all right, and are leafing out quite profusely. They will probably bear this season. The strawberry-raspberry is also starting up out of the ground quite thrifty and strong. The wonderful May-berry does not look quite so promising, but we are beginning to take courage. The Japanese wine-berry has been killed during the winter, except several inches of the wood belonging to the tips that took root last

fall. May be we shall be able to get a few berries from these.

#### THE IGNOTUM TOMATO.

Our veteran seedsman, J. H. Gregory, of Marblehead, Mass., on his experimental grounds last season, tested 45 different varieties of tomatoes. In the account given of this experiment, in a recent issue of the *American Agriculturist*, we find the following:

If I were asked what one variety for both market and home use I would select out of the entire lot tested in the experimental plot, and combining in the largest proportion all the most desirable traits, I should incline to select the Ignotum.

The above is exceedingly gratifying, especially as your humble servant had the honor of first giving the Ignotum to the world; and I have just interviewed our boys in regard to the matter. While the Ignotum many times seems to be about equal to any other, there are seasons when we are inclined to give the preference to some of the other kinds mentioned in our catalog. For instance, the Earliest in the World tomato is quite a little ahead of the Ignotum in earliness, but is small. Dwarf Champion and Livingston's Beauty are of a brighter color that takes the eye of many; and Livingston's New Stone, for a late tomato, is sometimes larger and of a little better shape.

#### THE "NEW CELERY CULTURE;" AN IMPROVEMENT ON IT.

From a recent number of the *Farm and Fireside* we take the following, which is high-pressure gardening, and no mistake:

Those who have tried to grow celery for market by the method known as the "new celery culture" have probably found it difficult to blanch it perfectly. Boards can not be easily used for blanching it when the rows are so close together. They have also found that, unless large quantities of fertilizers and water are supplied, the bunches are too small to be marketable, and that frequent irrigation is required because of the rapid escape of moisture during the long hot days in summer. I think I have developed some methods by which these difficulties have been largely overcome. My experiments were not very satisfactory with the "new celery culture" until last year, when I grew very fine celery in rows at an average distance of one foot apart. Some of this celery, marketed at a fancy price to some of the summer resorts near my village, paid me at the rate of five thousand dollars an acre; and from one large plot of early celery I realized at the rate of between two thousand and three thousand dollars an acre. I am so well satisfied with the results of my plan that I shall use it in my large celery field this year. The plot on which the celery was grown had received a heavy dressing of stable manure for several successive years, and was very rich. Another dressing was applied last spring and plowed in, then the ground was finely harrowed and smoothed with a light plank drag, and White Plume celery-plants set in May. Instead of setting the plants in rows one foot apart, as had been my custom, I set two rows six or seven inches apart, leaving an eighteen-inch space between the double rows. My plan was to board two rows together in blanching the celery, and to leave a space wide enough to walk in when placing the boards. The most of the cultivating was done with a wheel-hoe until the plants were eight or ten inches high, when the blanching-boards were set up and held in place by crosspieces notched and set over the top of the boards. It is very important that the boards be kept well apart until the celery has nearly reached its growth, for the leaves must be kept exposed to the air and sunlight. Near the celery-field is a large brook. Water from this was elevated into a large tank, and used for irrigating purposes. Iron pipes were laid from this tank over the celery-field, with hose attachments every few rods. In this tank I placed some loosely made bags filled with poultry manure. After the water had been allowed to stand a day or two it was distributed along between the celery rows with the hose. To retain the moisture and keep the ground from baking, the eighteen-inch space between the

boards was mulched with manure and other material. One could almost see the celery grow. In a short time it grew above the top of the eighteen-inch boards, and in the dark space between them soon commenced to blanch. It grew over two feet high; and when the boards were then crowded close together, the blanching was completed in a very few days. All who saw it said it was the finest field of celery they ever saw. I began to ship it to the dealers in near-by villages and to summer resorts along our railroad. After they had learned about the quality of the celery the demand was so great that I was unable to supply it, and the field of celery was marketed in a very short time. The celery grew so rapidly that it was very tender, and there were no hollow stalks. I have often been troubled with celery going to seed when planted so early, but on this plot of celery, which was nearly all marketed in August, hardly a single stalk went to seed. Celery grown in this way is very easily prepared for market. I take down the boards, and with a sharp knife cut the plants off a little below the surface of the ground, leaving the roots in the ground, which, with the celery trimmings, add something to its fertility. As fast as the plants were trimmed they were tied in dozen bunches and packed in six dozen baskets.

There is a large saving in labor with this method as compared with the old one of wide rows and banking with earth. Three or four times as much can be grown on the same land, and there is no banking, no digging up the plants with a spade, and no washing, for there is no soil put around the celery. The plan is an improvement over the one of setting the celery so close together that it will blanch by its own shade, for it blanches the celery perfectly. It is also an improvement over the plan of blanching it with boards in single wide rows, for in boarding double rows one-half of the boards are saved. The mulch between the rows retains the moisture, and less water is required in irrigating the celery. No one can be successful in growing celery by this method without making the soil very rich, and there must be water available for irrigation. With the conditions all right there is money in it. M. JENKINS.

We are sorry the editor did not give Mr. Jenkins' place of residence, for some of us might like to go and see him work on the plan he gives. It can be done, without question. In fact, I have at different times produced almost the same results; but to do what he claims, the ground must be exceedingly rich—in fact, a great part of the soil should be old well-rotted stable manure. The mulching with stable manure to keep the ground moist and hold the moisture is an excellent suggestion; and coarse straw manure will answer very well for the mulching. After you have learned just how, it may be an easy thing to do; but I would caution beginners to commence with a rod square or less; and when you can make this work all right, then increase your area. I believe the greater part of the attempts at the new celery culture have failed just because there was not old well-rotted manure enough, and water in sufficient quantities. Now, then, who among us is going to succeed in getting at the rate of *two or three thousand dollars an acre* for a single crop of celery?

---

## Health Notes.

---

### SANITARY HIGH-PRESSURE GARDENING.

Our good friend R. B. Hugman, of Hastings, Texas, sends us some suggestions in regard to dry-earth closets. Instead of using dry dust, such as we get in the roads, for instance, he advises using common garden soil sifted, but not so dry as to make a dust; then the product of the closet, after being shoveled over, is just right to work into the garden, or to be plowed under. With his letter he incloses a circular from a London firm, entitled "Moule's Patent

Earth closets and Commodes." This circular describes an arrangement very similar to my own for disposing of house slops, etc. From it I make the following extract:

Where there is a garden, the house-slops and sink-water may, in most cases, be made of great value, and removed from the house without the least annoyance. The only requirement is that there shall be a gradual incline from the house to the garden. Let all the slops fall into a trapped sink, the drain from which to the garden should be of glazed socket pipes, well jointed, and emptying itself into a small tank, 18 inches deep, about one foot wide, and of such length as may be necessary. The surplus rain-water from the roof may also enter this. Out of this tank lay 3-inch common drain-pipes, 8 feet apart, and 12 inches below the surface. Lay mortar on top and bottom of the joint, leaving the sides open. If these pipes are extended to a considerable length, small tanks, about one foot square and 18 inches deep, must be sunk at about every 20 to 40 feet, to allow for subsidence. These can be easily be emptied, as often as required; and the deposit may be either mixed with dry earth or be dug in at once as manure. The liquid oozes into the cultivated soil, and the result is something fabulous. This simple plan will effectually deal with the slops; there is no smell, no possibility of any foul gas to poison the atmosphere, and with this, and the product of the earth-closet, any ground may be made productive and profitable.

The following fact will illustrate the value of this system of dealing with house-slops, etc.

On a wall 55 feet in length and 16 feet high a vine grows. A 3-inch pipe runs parallel with this at a distance of 6 feet from it for the entire length; the slops flow through this pipe as above described. On this vine, year after year, had been grown 400 well-ripened bunches of grapes, some of the bunches weighing three-quarters of a pound. During a period of four years, for a certain purpose, the supply was cut off. To the surprise of the gardener, scarcely any grapes during those years appeared; but afterward the supply was restored, and the consequence was an abundant crop, the wood grew fully 16 feet, of good size, and well ripened.

The suggestion of small tanks to collect the sediment is a very important addition to my apparatus; and when I construct any more I shall put them in. The idea is the same thing that is often used in underdraining, and called a silt-basin or silt-well. The simplest way to make such a tank is to set a large drain-tile on end, say a foot or more across. If there is a large amount of subsidence, a two-foot length of sewer-pipe 18 inches or 2 feet across would be nice for the purpose; and these silt-basins should be covered in such a way that they can be emptied when necessary. In our own work we have used a common 12-inch drain-tile covered with a stone crock-cover. If the whole is covered with earth you must put an iron rod, or something similar, down where the silt-well is located, or you may not be able to find it. Where simply house-slops and nothing else are run into the tiles it will be a long while before these basins need emptying.

In regard to the value of slops for the garden, for fruit-trees, currant-bushes, or any thing of the sort, there is no possible question. This is a sort of sub-irrigation that every household can invest in. It will save the good wife laborious steps, will save doctors' bills, will keep the home looking neat and tidy, and will give you luscious fruit and vegetables at a very insignificant cost. The owner of any home should have ingenuity enough to adapt the apparatus to his immediate surroundings.

Now, friends, when I come to visit you do not have any unsightly slops in the back yard, but have some fruit-trees and vegetables that are utilizing every day all these waste products. I do not know of any work I enjoy more than constructing such an apparatus, for disposing of slops and sewage from the home.

## READ! READ!

E. T. Flanagan, Belleville, Illinois.  
Dear Sir:—The queen I received from you last year beats any queen I ever saw. If I ever need more queens I now know where to get them. Yours truly, M. SMISCHNY,  
Brentwood, Ark., May 2, 1896. Dealer in bees and honey.

E. T. Flanagan, Belleville, Illinois.  
Dear Sir:—The four three-frame nuclei and one full colony I bought of you last May, all arrived in excellent order and have done exceedingly well, considering they had a journey of over two thousand miles to reach my place in Idaho. Three of the nuclei gave a large natural swarm each, and, in addition, stored over 100 pounds of surplus comb honey each. The other one did nearly as well. The full colony swarmed also, and stored over 200 pounds of splendid comb honey in one-pound section boxes. I now have nine good strong colonies with plenty of honey to winter on, and have taken from them over 500 pounds of choice comb honey. I am well pleased with my venture. Yours truly, B. F. WHITE,  
Dillon, Montana, Jan. 5, 1897.

E. T. Flanagan, Belleville, Illinois.  
Dear Sir:—One of the 3-frame nuclei I got of you on May 8 is ahead of any thing I ever saw. I tell you they are doing nicely. Yours truly, H. W. SAVAGE,  
Baraboo, Wis., June 3, 1896.

Dear Sir:—From one of the 3-frame nuclei I got of you on May 8, 1896, I have had five good swarms, one of which got away to the woods. I raised 13 splendid queens, and got 69 pounds of No. 1 comb honey from it; besides plenty of honey to winter on. Can that be beat? I shall want about 35 nuclei for my self and about 25 for other parties, in the spring. Yes Sir, I am well satisfied. Yours truly, H. W. SAVAGE,  
Baraboo, Wis., Jan. 10, 1897.

E. T. Flanagan, Belleville, Illinois.  
Dear Sir:—The bees and queens I got of you last season were very good, and pleased me very much. They are beauties, and splendid workers. Yours truly, E. C. HASKETT,  
Palestine, Ill., Jan. 10, 1897.

Dear Sir:—I have bought bees and queens for the past 24 years, from all parts of the United States, and I never received any that gave me greater satisfaction than the nuclei and queens I received from you. You can book my order now for four nuclei to be delivered the coming spring. Yours truly, J. W. YOUNG,  
Kingman, Kansas.

Mr. Young has bought bees and queens of me for a number of years.

The above are only a few samples of reports from bees and queens I have sold the past season. I have been nearly twenty years in the business, and it is a real pleasure to please and satisfy my customers. This will not appear again. See small advertisement for hives, foundation, etc.

**E. T. FLANAGAN,**  
Box 783, -- BELLEVILLE, -- ILLINOIS.

## Wants and Exchange Department.

Notices will be inserted under this head at one-half our usual rate. Advertisements intended for this department must not exceed five lines, and you must say you want your advt in this department, or we will not be responsible for errors. You can have the notice as many lines as you please; but all over five lines will cost you according to our regular rates. This department is intended only for bona-fide exchanges. Exchanges for cash or for price lists, or notices offering articles for sale, can not be inserted under this head. For such our regular rates of 20 c. a line will be charged and they will be put with the regular advertisements. We can not be responsible for dissatisfaction arising from these "swaps."

**WANTED.**—To exchange Italian queens, bred from imported mothers, for plants, seeds, pet stock, or Cowan extractor. What have you to offer?  
J. H. GARRISON, 1011 N. 23d St., St. Louis, Mo.

**WANTED.**—To exchange Belgian hares, homing pigeons, White Leghorn eggs or breeding-stock for Italian queens from imported mother, pure-bred geese, ducks, or ducks' eggs, or offers.  
EUGENE MANNING, Jacksonville, N. Y.

**WANTED.**—To exchange eggs from B. Rocks, W. and Buff Leghorns, S. S. and Buff P. Bantams, for wax or queens. J. HALLENBECK, Altamont, N. Y.

**WANTED.**—To exchange young laying queens for bee-hive machinery or full colonies of bees; will pay cash for bees if preferred.  
H. G. QURIN, Bellevue, O.

**WANTED.**—To exchange incubator, hives, supplies, rubber printing-outputs, or cash. Want honey, wax, or fdn.  
O. H. HYATT, Shenandoah, Page Co., Iowa.

**WANTED.**—To exchange standard varieties strawberry-plants and Turner raspberry-sets for any thing useful.  
H. R. GEBHART, Miamisburg, O.

**WANTED.**—To exchange single-case World typewriter (good as new); also hybrid bees in full colony, for extracted honey or offers.  
A. W. GARDNER, Centreville, Mich.

**WANTED.**—To exchange strawberry-plants, Buebach, Jessie, Warfield, Crescent, Haverland, Gandy, valued at \$2 00 per 1000; Cuthbert raspberry; Snyder, Taylor, Western Triumph blackberry, cheap for beeswax.  
A. P. LAWRENCE, Hickory Cor., Mich.

**WANTED.**—To exchange bicycle for foot-power screw-cutting lathe, Barnes saw, or mechanic's tools.  
ROBERT B. GEDYE, La Salle, Ill.

**WANTED.**—To exchange Barnes foot-power saw, Wilson bone-mill, double-barrel shot-gun, for bees or nuclei.  
J. T. ELLIOTT, Colliers, W. Va.

**WANTED.**—To exchange a fine new Story & Clark upright piano, for honey or offers.  
E. T. ABBOTT, St. Joseph, Mo.

**WANTED.**—To exchange all kinds of bee-supplies for 2 H. P. gasoline-engine or offer.  
DEANES & MINER, Ronda, N. C.

**WANTED.**—L. drawn combs and Langstroth or Simplicity hives. Second hand. Describe, and give price.  
N. E. BOOMHOWER, West Groton, N. Y.

**WANTED.**—To buy an apiary of 50 to 100 swarms, or to exchange pure-blooded McKarp chickens.  
B. F. HOWARD, Hayt Corners, N. Y.

**WANTED.**—To exchange Prairie S. incubator and brooder, No. 1 Zimmerman fruit-dryer, White Leghorn eggs, small-fruit plants, for Italian bees, team harness, Eureka and Loudon raspberries, or offers.  
G. M. AMES, Tamaroa, Ill.

**WANTED.**—A young American man would like a position in some western apiary. Had 2 years' experience. Would prefer a good chance to learn rather than first-class wages. Can give good recommendation.  
A. E. FORD, Fitchburg, Mass.

**WANTED.**—Bees by pound or colony. Answer quick.  
M. ALEXANDER, Hartford City, Ind.

**WANTED.**—To exchange one microscope in mahogany case, for photographic outfit, kodak preferred.  
L. L. ESENHOWER, Reading, Pa.

**WANTED.**—To exchange 60-lb. cans in good order, boxed, valued at 25 cts. each, delivered, for comb or extracted honey, of this or next season's crop, at the market price. Quantity lots at reduced rates.  
B. WALKER, Evart, Mich.

## Root's Goods.

Before placing your order for this season, be sure to send for Root's

### 1897 Catalog, ready now.

Our 1897 hives, with improved Danzy cover and improved Hoffman frames, are simply "out of sight." Acknowledged by all who have seen them to be a great improvement over any hive on the market, of last year.

## Comb Foundation.

Cheaper and better than ever; clear as crystal, for you can read your name through it. Process and machinery patented Dec. 8, 1896, and other patents pending. Samples of the new foundation free.

### The A. I. Root Co.,

Main Office and Factory, Medina, Ohio.

Branch offices at 118 Michigan St., Chicago; Syracuse, N. Y.; St. Paul, Minn.; Mechanic Falls, Me.; No. 10 Vine St., Philadelphia, Pa.

#### MAPLE SUGAR AND SYRUP.

We are still prepared to supply maple sugar and syrup at prices noted in our last. We have a supply on hand for prompt shipment.

#### DOVETAILED LIVES, 1896 PATTERN.

Those who prefer last year's pattern of frames and cover and style of packing, we are prepared to supply on short notice, as we have quite a stock of No. 1 Dov. hives, put up before the changes for 1897 were decided upon. These are furnished at 5 cts. per hive less than the list price of 1897-pattern hives.

#### HONEY.

We have the choicest Wisconsin clover and basswood honey to offer in 60-lb. cans, 2 in a case, at 7 cts. In 1-gallon cans, 8 in a case, at \$6.50 per case; 2 cases at \$6.25; 5 or more at \$6.00. Just think of it! the choicest honey in one-gallon cans at 75 cts. a gallon! There are few families who would not take a gallon of such honey at \$1.00 if they had the opportunity. It has all been melted.

#### SECOND-HAND FOUNDATION-MILLS.

Since our last we have added two choice mills to our stock of second-hand machines as follows: One 10-inch round-cell, No. ZZ. Price \$12.00. This will make foundation about 6 feet to the pound, and has had excellent care; is practically as good as new, and good value for the price. One 6-inch hex., No. 1331. Price \$12.00. This has been used just enough to get it into the very best condition for work, with very thin base. Will make 11 feet to the pound. Practically as good as new. We have most of the mills listed in our last issue.

#### CARLOAD SHIPMENTS.

Since our last issue we have made up a large carload of export orders, the principal shipment going to Sydney, Australia. We have another car to load for same port, and one for Liverpool, England. We have also put up a large car for Reno, Nevada, and we are nearly sold out of both lettuce and spinach, and our customers come right to our beds and take it away. So much for having a nice crop maturing just about the middle of April, when there is the greatest demand for such products.

We are running eleven hours a day in most departments, and the section machinery fifteen hours a day to keep pace with the demand.

#### DRAWN FOUNDATION.

We are now turning out drawn foundation in pieces 2x4 inches in size, with cells  $\frac{1}{4}$  inch deep on each side the base. There are eight of these pieces in an ounce, or 128 to the pound, or about 8 square feet to the pound; with cells only  $\frac{1}{2}$  inch deep each side, there are 12 pieces in an ounce, or 12 square feet to the pound—as light as extra thin foundation. By rolling the sheet wax down still thinner it can be made lighter than any foundation now offered for sale, or which has ever been produced. With a little more work on the machine, and more pressure, we shall be able to turn out pieces 5x8 inches in size. For the present we offer only the pieces 2x4, two of which fill a 1-lb. section. To enable many to try a little of it we will send 6 pieces, 2x4, put up in 1-lb. section, postpaid to any address, for 12 cts. In stamps, or the same shipped with other goods for 10 cts. These will have cells about  $\frac{1}{4}$  inch deep. A package containing 10 pieces 2x4, with cells  $\frac{1}{2}$  inch deep, mailed for 15 cts.; shipped with other goods for 12 cts.

"The proof of the pudding is in the eating," even so the proof of the value of this drawn foundation will be finally in the eating of the honey produced with it, and the way the bees take old of it. A little practical experience in this line will be worth more than all the theory you can pack into all the articles and editorials which may be printed in a generation. We believe that, for a perfect article of comb honey, it is going to entirely remove the objection which is often urged against the use of ordi-

nary foundation. We hope many will give it a careful trial this season on a small scale. We shall then, at the close of the season, have testimony of some value as to its utility and desirability in use.

#### VAN ALLEN & WILLIAMS' CLAIM.

Van Allen & Williams, of Barnum, Wis., are claiming that our four and six frame Cowan extractors are an infringement upon the patented automatic reversing extractor of their own. We have before us a copy of the patent, dated Nov. 15, 1892. The object of the invention is to secure automatic reversing of the pockets. There is only one claim, and that a combination claim, and a very narrow one at that, covering a peculiar method of automatic reversing. Our extractors do not reverse automatically. One hand turns the crank, and the other reverses the baskets without even stopping the machine. Moreover, we can prove by plenty of printed references that the vital features of our Cowan extractor, including the sprocket-wheel and chains, are old ideas. The claims of Van Allen & Williams are preposterous. It is unnecessary to state that we shall protect all those who are using Cowan extractors.

#### Special Notices in the Line of Gardening, etc.

By A. I. Root.

#### DWARF ESSEX RAPE.

We are pleased to tell our friends that we have succeeded in making the following low prices for the coming season: 1 lb., by mail, postpaid, 20 cts.; 5 lbs. or over, 8 cts. per lb.; 100 lbs.,  $\frac{1}{4}$  cts.

A special leaflet in regard to above sent every purchaser, or mailed on application.

#### GRAND RAPIDS LETTUCE.

Since my statement on page 264, of our last issue, in regard to lettuce, we have sold 275 lbs., and the greater part of it came from two beds, each 50 feet long. The plants were set out in November in one of the beds, and in the other about the middle of January. We arranged the heat so as to have them mature just when there was the best demand for them. We have been getting a dollar a bushel for spinach grown under glass in the same way, and the demand bids fair to be beyond our supply, for we are nearly sold out of both lettuce and spinach, and our customers come right to our beds and take it away. So much for having a nice crop maturing just about the middle of April, when there is the greatest demand for such products.

#### VEGETABLE-PLANTS READY APRIL 15.

We have a very fine stock of almost every thing. Our twice-transplanted cabbage-plants have been through so many freezes and snowstorms, without protection, that we consider them fully equal to cold-frame plants started in the fall. These large twice-transplanted plants are 10 cts. for 10; 75 cts. for 100; \$6.00 per 1000. We have also a fine stock of those once transplanted, at just half the above prices.

Of cauliflower we have the finest lot I think I ever had at this season. The price is the same as the cold-frame cabbage-plants. We have also a nice lot of very fine tomato-plants, including the new Earliest in the World. The price of these also is the same as the cold-frame cabbage-plants. Twice-transplanted plants, large and stocky, double above prices. Celery-plants, White Plume, Golden Dwarf, 40 cts. per 100, or \$3.00 per 1000. Sweet-potato plants, four different varieties—General Grant, Bunch Yam, Yellow Jersey, and Early Peabody. Price 5 cts. for 10; 40 cts. per 100; \$3.00 per 1000. Sweet-potato plants, however, will hardly be ready before about the last week in April. All plants wanted by mail will be 25 cts. per 100 extra, and the twice-transplanted plants are, as a rule, too large to be mailable.

#### POTATOES FOR PLANTING.

We still continue our offer made on page 264 of our last issue, of a dollar's worth of potatoes for every new name for GLEANINGS, and 50 cents' worth for renewal. Please read carefully the conditions as given in last issue. In addition to this the price of *Thoroughbreds* will be reduced from \$5.00 to \$3.50 per barrel; bushel, \$1.50;  $\frac{1}{2}$  bushel, 85 cts.; peck, 50

cts; ¼ peck, 30 cts. Remember, the Thoroughbred is probably the best yielder among all the early potatoes; and in *quality* it is next to the Freeman. We had some for dinner yesterday, and it was a pretty hard matter to decide whether the Freemans were any ahead. The Freeman is the better-shaped potato when grown on *our* soil; but those grown by friend Manly, in Michigan, are as good shape as any Freemans. Our stock of Carman No 3 is just sold out.

Later.—At the present writing, April 14, we have plenty of potatoes to give away to our subscribers, of each of the following kinds: Early Thoroughbred, Early Ohio, Freeman, New Queen, Sir William, Manum's Enormous, and New Craig. We have *seconds* to give away of only Thoroughbred, New Queen, and New Craig.

We have a limited supply for sale of Early North-er, Burpee's Extra Early, Monroe Seedling, Rural New-Yorker, Carman No. 1, and Koshkong. The latter we can fill orders for promptly, at prices given in table. Seconds are all gone of Early Ohio, Freeman, and Rural New-Yorker.

| NAME                   | 1 lb. by mail. | 3 lbs. by mail. | ½ peck. | Peck. | ½ bushel. | bushel. | Barrel—11 pk. |
|------------------------|----------------|-----------------|---------|-------|-----------|---------|---------------|

#### LATEST AND LARGEST OFFER YET MADE IN THE WAY OF PREMIUM POTATOES.

The New Queens are an early potato; in fact, we have some testimony to the effect that they are almost if not quite as early as any potato we have; at least, this I know—they are in more of a hurry to sprout in the spring than any other potato we handle. Now, then, ours are beginning to sprout, although they have not as yet sprouted so as to injure them in any way for planting; and on this account they must be moved off quickly; therefore, until they are closed out we will give a barrel of firsts to every one who sends us a dollar for a new subscriber, and a barrel of seconds to every one who sends us a dollar for a renewal, subject to the conditions heretofore mentioned, that the new subscriber must be in a new locality, where GLEANINGS has not been going, and that the renewal shall be from somebody who has paid up all arrearages; and in both cases the money is to be sent by somebody who is at present a subscriber. A barrel of New Queen firsts is worth \$1.25; in fact, no other seedsman advertises them any lower than this, that I know of. A barrel of seconds is certainly worth half price—63 cents. Now, then, friends, if you want some nice early potatoes for immediate planting, make some of your relatives or friends a present of GLEANINGS, and get a barrel of firsts, or pay up your own subscription two or three years ahead, if you want to do so, and get a barrel of seconds for every year you pay for.

#### SNAILS WITH GARDENING UNDER GLASS.

When your plants, either in the greenhouse, hot-beds, or cold-frames, are having their foliage eaten off without your being able to find any insect or other enemy around, you can be pretty sure it is snails, and they do their work in the night. We suffered a good deal of loss from them until I determined to sit up all night if I could not find the culprits otherwise. With the light of a lamp with a good shade on it I found them right at the mischief. They are worse in damp weather, and they get in from the sides of the bed. When you see the plants clear up against the outside boards nibbled off, and nowhere else, you may know it is snails. The best

remedy we have ever found is tobacco dust. If you sprinkle it around the walls of the greenhouse, or against the damp edges of your cold-frames and hot-beds, you will probably see no more of the snails. Remember, we now furnish 100 lbs. of nice tobacco dust for only \$1.75. For prices in smaller quantities, see our seed and plant catalog.

#### THE HOTCHKISS INSECT-POWDER DISTRIBUTOR.

We may say to our readers that the implement shown on page 306 can be ordered direct from us at the same price as from the manufacturers. We also furnish with the machine an attachment, not shown in the cut, to throw a limited quantity of Paris-green dust right over the potato plants when they first come up. This attachment also serves to keep the dust well away from the face of the operator, and is quite a convenience when the weather is the least bit windy. We used one last season on our potatoes, currants, and gooseberries, and on almost every thing else, in fact, where insects troubled us. Commence early to fight insect-foes—almost before they get on your ground—and you will find it much easier to keep ahead. Until last season we had more or less trouble with worms on our currants and gooseberries. In spite of us they would get the leaves trimmed off more or less. By using Paris green as above, and commencing as soon as the first leaves showed, scarcely a worm was seen on the bushes during the season; and we attributed our great crop of currants and gooseberries largely to our thorough dusting with Paris green very early in the spring. Of course, you do not want to use Paris green when berries of any kind are nearly large enough to use.

#### SOME OF THE NEW STRAWBERRIES, ETC.

Some time last fall, Thompsons Sons, of RioVista, Va., sent me half a dozen strawberry-plants named "Earliest." We gave them good care, and to-day, April 14, every one of the half-dozen is in blossom. No other plants out in the open air have any signs of blossoms at all. Of course, we can not tell yet how they will turn out, but I think they are going to bear berries *earlier* than anything we ever got hold of before.

There are two other new strawberries that make me happy every time I go past the bed where they are growing. They are the "Nick Ohmer" and the "Margaret." Of course, I have not seen them fruit yet; but they are growing with such strong rank luxuriant foliage that it is a pleasure to see the progress they are now making day by day. The plants cost us 25 cts. apiece, and on that account we have been covering them with squash-boxes every frosty night. The pane of glass on top of the box gives them all the light they need, even if the box is not taken off every day when the sun gets well up. A little protection to strawberry-plants during the frosty nights of April certainly goes a great way toward making them early, besides protecting the buds from frost. I have not yet tried cotton cloth; but I firmly believe we could get berries enough earlier by the use of cotton cloth, rolled up as explained in the tomato-book, to pay for the investment. You see we should then have this matter of injury from late frosts right under our thumb.

#### THE HOT SUN DURING THE LAST OF APRIL.

Look out for it in the middle of the day, especially on recently transplanted plants. A little practice will enable you to tell when they are suffering serious injury. Just before this time arrives, protect them from the sun with shutters or cotton cloth, or both. Where the sun is very hot and the air very dry, better put on the sashes just as you would keep out the frost, then cover the glass almost entirely with shutters. I say *almost entirely*, because plants are better with a little light, if they do not get too much; and they are better with a little air if they do not get too much; therefore you can provide the right quantity of both by leaving the sashes and shutters a little space apart. All this takes time and fassing, I grant; but when orders are waiting for plants you can not afford to leave any stone unturned in order to push them forward; and where every thing is done just right, plants will grow at an astonishing rate; and if you *love* the plants you will soon learn to enjoy with a keen zest protecting them and providing for them so as to make them do their very best.

## Kind Words From Our Customers.

The new drawn comb foundation is grand. I hope it may become practicable. C. F. PULSIFER.  
Dryad, Wash.

I wish to express my sincere thanks for the courteous, honorable, and kind treatment which I have always had at your hands. CHAS. B. WILSON.  
Norfolk, Va., Feb. 5.

I have taken GLEANINGS since '88, and it grows better every year. Don't forget footnotes and Notes of Travel. Give the swindlers Jessy; every thing good in it. L. D. HOPKINS.  
Trumansburg, N. Y.

FROM A PROFESSOR OF THE UNIVERSITY OF NEBRASKA.

I have received the watch which I ordered from you recently, and find it all right. I am well pleased with it, and could recommend your firm to my friends. LAWRENCE BRUNER.  
Lincoln, Neb.

A BEE-KEEPER 77 YEARS OLD, AND A BICYCLE-EXPERT. I am now in my 77th year and do not expect to keep bees any more. I shake A. I. R.'s hand, and bid him farewell. Tell him that I, too, ride the bicycle daily, and hope he will be able to do so when he is 77 years old. JOSEPH SINTON.  
Henrietta Court, Pasadena, Cal.

### THOSE HONEY-JUMBLES—A SUGGESTION.

Please have your folks try putting a teaspoon of granulated sugar and one cup of water in making the honey-jumbles, instead of the molasses and a small quantity of water, as in the recipe. We prefer the sugar, but perhaps it may be because we did not have the right kind of molasses. MRS. S. H. COLLINS.

### TREATING SCABBY SEED POTATOES WITH CORROSIVE SUBLIMATE.

*Friend Root:*—My seed potatoes last year were very scabby. You advised me to treat with corrosive sublimate, which I did, and the potatoes were perfectly free of the disease. G. M. WHITFORD.  
Arlington, Neb., Apr. 1, 1897.

[Full directions for treating scabby seed potatoes will be found on the last page of our new seed catalog.]

### MORE ABOUT THE CRANDALL CURRANT.

I bought two Crandall currant-bushes some years ago; planted apart about 50 yards. They bloomed abundantly every spring, but gave only a few berries. I saw in some catalog that they appear to be male and female. Last spring I dug one of them up and planted it by the side of the other. Last summer you ought to have been here to see my bushes loaded with those big black Crandall currants. JOHN SLAUBAUGH.

### ANOTHER REPORT FROM THE LOGAN BERRY.

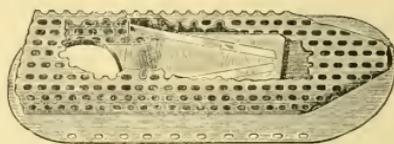

The last GLEANINGS asked for information about the Logan berry. It is a cross between the blackberry and raspberry, and has the color of the raspberry, but is sour and tasteless. A nurseryman near Watsonville plowed up ten acres of them. They were no good. A neighbor did the same to a smaller patch. The berries look fine in a slide, and they have sold as high as ninety cents, but the demand is light. The originator is Judge Logan, and I believe he lives at Santa Cruz. ELSIE L. TORREY.  
Aromas, Cal., Mch. 26.

The A B C came all O. K. and I am very much pleased with it. It is very much improved since I ordered my last one.

I can not understand why any one should say that sweet clover is not good for stock. I have not very much of it, but what I cut and fed green was eaten up very greedily, after becoming used to it, just the same as alfalfa. In fact, stock must become used to any new thing. I turned three calves out this morning on blue grass. One of them is six months old, and I have not seen them take a bite of grass yet. They were turned out five hours ago.

All the complaint I have heard about sweet clover is that it is a bad weed; but as it dies every two years, and comes from seed, I do not see how that can be very bad. J. T. VAN PATTEN.  
Lion, Kan.

## Porter Honey-House Bee-Escape.

Have you seen it? Just the thing to put on the doors or windows of your bee-rooms. Indispensable, you'll say, after you have tried it.

Price by mail, 35 cents.

## Cowan and Novice Extractors.

These are the best. We are prepared to furnish on short notice, from any of our several branches, 2, 4, and 6 frame Cowans, and 2-frame Novices.

If you want the genuine, see that they bear our name.

A 36-page catalog sent free on application.

THE A. I. ROOT CO., Medina, Ohio.

**NUCLEI** FOR SALE. Three-frame nuclei on Langstroth frame, \$2.25; two-frame, \$1.85, with queen.

W. H. STANLEY, Dixon, Lee Co., Ill.

**EGGS** from ten-pound Pekin Ducks for sale; \$1.00 per 12.

NEW YORK.—*Honey*.—Fancy white, 11; No. 1 white, 10; fancy amber, 9; No. 1 amber, 8; fancy dark, 6; white extracted, 5@5½; amber, 4@4¼; dark, no sale; beeswax, 26@27. We have no changes in prices to report. Stocks are pretty well cleaned up, very little left of any kind. We have yet some demand for comb honey, and are selling some right along. We expect new crop of Southern latter part of next month, and judging from reports we received the South will have a good crop.

HILDRETH BROS. & SEGLKEN,  
 120-122 W. Broadway, New York.

PHILADELPHIA.—*Honey*.—White extracted, 5@6; amber, 4@5; dark, 3½@4; beeswax, 25. No comb honey in our market, except odd lots broken down, no call whatever.

Wm. A. SELZER,  
 Apr. 19. 10 Vine St., Philadelphia, Pa.

KANSAS CITY.—*Honey*.—No. 1 white, 12@13; fancy amber, 11@12; No. 1 amber, 10@11; fancy dark, 9@10; No. 1 dark, 8@9; white extracted, 5; amber, 4½; beeswax, 25.  
 C. C. CLEMONS & Co.,  
 Apr. 19. 423 Walnut, Kansas City, Mo.

MINNEAPOLIS.—*Honey*.—Fancy white, 12@13; No. 1 white, 10@12; fancy amber, 9@10; No. 1 amber, 8@9; fancy dark, 7@8; No. 1 dark, 6@7; white extracted, 6@7; amber, 5@6; dark, 4@5; beeswax, 22@25. Market remains unchanged for both extracted and comb.  
 S. H. HALL & Co.,  
 Apr. 19. Minneapolis, Minn.

DETROIT.—*Honey*.—Fancy white, 10@11; No. 1 white, 9@10; fancy amber, 8@9; No. 1 amber, 7@8; fancy dark, 7; white extracted, 5@6; amber, 4@5; dark, 4; beeswax, 25@26. There is barely any sale for comb honey. Extracted, fair demand at a tendency to lower prices.  
 M. H. HUNT,  
 Apr. 20. Bell Branch, Mich.

FOR SALE.—\$25.00 for one 500-lb. barrel of A No. 1 linn extracted honey, F. O. B. cars here; or 5½c in packages of 60 lbs. each. J. B. MURRAY, Ada, O.

Honey Colonies.

CITY MARKETS.

CLEVELAND.—*Honey*.—Fancy white, 11@12; No. 1 white, 9@10; fancy amber, 8@9; white extracted, 5@6; beeswax, 23@25. Honey moving very slowly, even at low prices.  
 A. B. WILLIAMS & Co.,  
 Apr. 19. 80-82 Broadway, Cleveland, O.

MILWAUKEE.—*Honey*.—Fancy white, 13@14; No. 1 white, 11@12; fancy amber, 8@10; No. 1 amber, 7@9; white extracted, 6@7; amber, 5@5½; dark, 4@5; beeswax, 25@26. This week there has existed a fair demand for honey of all grades, both extracted and comb. And demands for fancy comb honey exceed the supply, while medium and lower grades are hard to move. Now, this is a strong argument for apiarists to remember; and aim at putting every thing possible on the fancy list and grade, and good results will follow.  
 A. V. BISHOP & Co.,  
 Apr. 17. 80-82 Broadway, Milwaukee, Wis.

BOSTON.—*Honey*.—Fancy white, 13; No. 1 11@12; white extracted, 7@8; amber, 6; beeswax, 25@26. As warm weather approaches the demand for honey drops off; but there is still a fair demand for best 1-lb. sections in cartons. Beeswax wanted.  
 E. E. BLAKE & Co.,  
 Apr. 17. 57 Chatham St., Boston, Mass.

CHICAGO.—*Honey*.—Fancy white, 12; No. 1, white, 10@11; fancy amber, 9@10; No. 1 amber, 7; fancy dark, 7@8; No. 1 dark, 7; white extracted, 5@7; amber, 5@6; dark, 4@4½; beeswax, 26@27. The market is bare of the best grades of white comb honey.  
 R. A. BURNETT & Co.,  
 Apr. 17. 163 So. Water St., Chicago, Ill.

COLUMBUS.—*Honey*.—Fancy white, 12@12½; No. 1 white, 11; fancy dark, 8. While arrivals of white comb are light, the demand corresponds; would not advise any shipments without making direct inquiry.  
 THE COLUMBUS COM. & STORAGE Co.,  
 Apr. 21. 409-413 N. High St., Columbus, O.

ALBANY.—*Honey*.—Fancy white, 10@12; fancy amber, 7@8; fancy dark, 6. There is some little demand for both clover and buckwheat comb honey, but most of the stock on our market is candied, and on that account hard to sell. No demand for extracted.  
 CHAS. McCULLOCH & Co.,  
 Apr. 20. Albany, N. Y.

CINCINNATI.—*Honey*.—No. 1 white, 12@14; No. 1 amber, 10@12; white extracted, 5@8; amber, 4@5; dark, 3½@4; beeswax, 22@25. Demand slow for all kinds of honey. Demand fair for beeswax.  
 CHAS. F. MUTH & SON,  
 Apr. 19. Cincinnati, O.

ST. LOUIS.—*Honey*.—Fancy white, 12½@13; No. 1 white, 11½@12; fancy amber, 10½@11; No. 1 amber, 9; fancy dark, 8; No. 1 dark, 7; white extracted, in bbls., 5½; in cans, 7; amber, in bbls., 5; in cans, 5½; dark, 4@4½; beeswax, 24@25. Stocks of honey well reduced. Good demand for choice stock both comb and extracted.  
 WESTCOTT COMMISSION Co.,  
 Apr. 19. 213 Market St., St. Louis, Mo.

 Do You Use INK? Send your address, with 6 cents, to the Handy Ink Co., Detroit, Mich. They will mail you one package of Handy Crystals that will, when put with lukewarm soft water, instantaneously dissolve and make one-half pint of blue-black ink, worth 50 cts. Warranted not to fade, or thicken in the bottle.

**BEES** FOR SALE. In 8-frame Dove-tailed hives, queens from imported mothers. Price \$3.00 to \$4.00 per colony.  
 EDW. SMITH, Carpenter, Ill.

**FOR SALE.** The Great French Strawberry, "LOUIS GAUTHIER." The only large fruiting kind that bears on young runners. Old plant fruits in June, making runners which fruit in September. Write for particulars.  
 ARTHUR T. GOLDSBOROUGH,  
 West Washington, D. C.

**Tested Italian Queens** By mail, in July and August, 60 cts. each.  
**J. C. Wheeler, Plano, Ill.**

**Southern Cow-Peas.** One hundred bushels of the speckled or Whippoorwill variety, which is the earliest and best for general cultivation, will be delivered f. o. b. at \$1.50 per bushel.  
 W. H. GREER,  
 Box 10, Paris, Tenn.

**For Sale.—= Bees and Queens.** Queens, \$1.00. Bees by the pound, \$1.00. Nuclei, two frames, with queen, \$2.50; one frame, \$2.00. Also Barred and White P. Rocks, Silver Laced Wyandottes. Eggs for sitting, at \$1.00 for 15.  
 MRS. A. A. SIMPSON, Swarts, Greene Co., Pa.  
 Please mention this paper.

# A Tested Queen for 50 cts.

As usual, I am re-queening my apiary this spring with young queens, selling the tested queens, that are removed, at \$1.00 each. These queens are fine Italians, right in their prime, being of last year's rearing. I am also starting a large number of nuclei in which to test queens, and can soon give purchasers their choice between queens of *this or last year's* rearing. You ask, Where does the 50 cent queen come in? It comes in right here. To every one not now a subscriber who will send \$1.00 for the Review for 1897, will send one of these tested queens for 50 cents.

There are thousands of bee-keepers in this broad land, who, if acquainted with the Review, would read it year after year, and it is to once get it into such hands that this special offer is made. I will also send the Review one year and 1000 strictly first-class sections for only \$2.50. Or a Bingham Conqueror smoker and the Review for only \$1.75.

W. Z. HUTCHINSON, Flint, Mich.

### STRAY STRAWS

FROM DR. C. C. MILLER.

A  $4\frac{1}{4} \times 4\frac{1}{4}$  SECTION, no matter what its thickness, will be  $\frac{1}{4}$  inch thicker without separators than with, and will weigh nearly three ounces more.

VINEGAR can not be made from honey, says C. P. Dadant, in *American Bee Journal*, if you make it stronger than 3 pounds of honey to a gallon of water.

SKYLARK reports feeding boiled juice of Muscat grapes for wintering, and this spring he's boiling raisins and then pressing the juice for spring feeding.—*American Bee Journal*.

A HUGE BEE-TREE, in 1884, in Australia, according to a report in *Progres Apicole*, yielded 7700 pounds of honey. Wonder if a decimal point couldn't be worked in somewhere to advantage in that 7700!

IN SOME RESPECTS thick separators are better than thin; but a strong argument in favor of thin separators is that they are so cheap they can be thrown away when used once, saving the trouble of cleaning.

THE *Pacific Bee Journal* blames light-weight sections for demoralizing the Los Angeles market. The buyer buys light weights at 9 cts. by the *piece*, then uses that as a leverage to buy the next lot at 9 cts. a *pound*.

SOME FRENCH WRITERS say a queen will not go up to lay in a super if the direction of the combs crosses that of the combs in the lower story, unless there are drone-cells above. There seems no reason for that, but they claim it holds good.

DRAWN COMB with cells  $\frac{1}{4}$  inch deep measures 8 feet to the pound, and thin foundation 10 feet. Is it worth while to make much fuss about 25 per cent more "gob" in a section, especially if that "gob" is mainly a matter of imagination?

THOSE DEFINITIONS on p. 286 are all good but

the last, which might better be called "leveled comb," for it's "drawn comb" just as much before it's leveled as after. [Yes, I like your term "leveled comb;" and as we have only just begun the use of the word, GLEANINGS will adopt it in preference to drawn comb.—Ed.]

TELL US how you fasten drawn foundation in sections. I suppose a Daisy fastener might be arranged to work, but hardly a Parker. But no one who has tried a Daisy would use a Parker. [We have been using the Daisy so far. It would be impossible to use the Parker, of course.—Ed.]

DOOLITTLE, p. 286, favors natural swarming, and thinks if artificial increase is practiced it is greatly better to wait "till very near, or just at the close of the harvest." He gives such good reasons for this latter that it raises the question whether it may not be better than natural swarming, which comes generally near the beginning of the harvest.

APIS DORSATA, it is generally taken for granted, has a longer tongue than the common bee. John A. Pease questions this, seeing *dorsata* is an entirely distinct species. "The bear is a much larger beast than the cat, but he has a shorter tail, and it may be so with this bee's tongue.—*Pacific Bee Journal*. [See editorials regarding *Apis dorsata*.—Ed.]

JUST AS MUCH FUN watching the bees get to work this spring as it was 35 years ago. [It is a pleasure to know, doctor, that you have not lost your old-time enthusiasm. Young chaps like you and I, even if there is a difference of 31 years between our ages, can not afford to lose our love for the business. Some people never grow old, and you are one of them.—Ed.]

C. DADANT thinks it not necessary, but a damage, to give bees water in transit. They need much when flying, but not when shut in.—*Revue Internationale*. [We used to give bees water in transit, but gave it up principally because the water leaked out, softened the prepared sugar feed, and daubed the bees up. Personally I should be inclined to think

water is an advantage, provided the difficulty mentioned could be successfully eliminated.—ED.]

HON. EUGENE SECOR is a good man wherever he has been tried so far, and he's likely to keep up his reputation as General Manager of the U. S. Bee-keepers' Union. [Yes, indeed, he is a good man all round. He is popular, influential, and a thorough-going business man, and one whom it is a real pleasure to know. With all his other accomplishments he is the poet laureate among the bee-keepers of America.—ED.]

THE PRICE of drawn foundation must come down a good bit before I can afford to fill sections with it, but I think I might afford it for bottom starters. [Of course, it is understood that our drawn foundation is now made on small dies, and at present prices could not be sold very cheaply. We hope, before the season is out, to have dies 5x8, at which time we shall be able to supply our friends with the product, at reduced prices. Next season, if the article proves to be the success that is now seems assured, we shall make dies and hydraulic machinery on a sufficiently large scale to supply the article in quantities, and at prices within the reach of bee-keepers.—ED.]

DR. L. LATINNE says in *Progres Apicole* that drone comb within the cluster of bees in winter is detrimental. Each empty cell has a bee, making the cluster 50 per cent less compact where drone-cells are. He thinks spreading the combs for winter is at least useless, as with empty cells the bees are practically clustered solid. [Before the advent of Hoffman frames, in our apiary we invariably spread the frames in the fall for winter, thinking it to be an advantage; but since using the self-spacers we have been in the habit of leaving the frames just as they are in summer; and our success in wintering has been just exactly as good; indeed, we have had much better results in the last four or five years. While we would hardly attribute it to the closer spacing it is very evident that just as good results can be and are secured.—ED.]

RIETSCHKE, the inventor of the Rietsche foundation press, of which 10,000 are now in use, a press turning out 150 sheets in an hour, now uses a lubricant made as follows: Put into a little bag 2 ounces soft soap; stir the bag in 5 quarts warm water till the soap is thoroughly dissolved; then add 5 qts. cold water. [Strangely enough, we sent for and obtained one of these presses, and we made it work after a fashion, but it was altogether too slow. It now stands on a shelf, unused. It is doubtful whether such a machine would find a sale in this country, even if advertised at the same price as in Germany, because, at present prices of foundation, no bee-keeper could afford to make his own, es-

pecially if he could turn out only 150 sheets an hour. Foundation-making in this country is now left almost entirely to the large makers; and very many of the large supply houses can not afford to make their own, because they can buy cheaper.—ED.]

MY EXPERIENCE has led me to like thin surplus foundation better than extra thin. How does that compare with the general drift? What's the proportion of thin to extra thin manufactured? [The foreman of our foundation department tells me there is about a half more of thin called for than of extra thin, notwithstanding the fact that, since the advent of the new Weed process, we have made the *thin* about as light as the old extra thin, and the extra thin lighter still. The new process of sheeting makes the foundation so much tougher that we found we could make all our grades of foundation lighter; and I believe that our extra thin, light as it is, 12 to 13 feet, will be more acceptable to the bees than our old extra thin of 11 to 12 feet to the pound. Another season it may be possible to reduce the weight still more. Your experience that led you to prefer the thin was reported in GLEANINGS, and was at the time we were making foundation by the old process.—ED.]

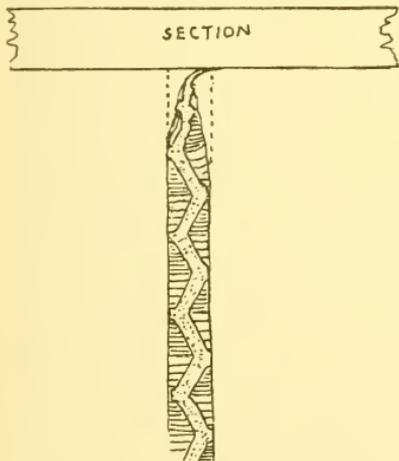

I DON'T KNOW every thing, Mr. Editor, but I *think* I know that you don't know what you're talking about on p. 286. I've used drawn combs by the thousand, and I don't care how deep the cells are so they're nice and clean, and don't come close enough to the separators to be bridged. [While you are perhaps able to use full-depth cells, the majority do not seem to make a success of it. While I may be wrong, I base the reasons for my opinion, as stated on p. 286, on two things: Honey stored in shallow cells, the cells being drawn out gradually as they are filled, acquires a certain delicious flavor that I do not believe will be found in honey stored in deep cells at the start. Theoretically, at least, honey will ripen in shallow cells more perfectly than in deep ones. A good many people always believe that comb honey is a little finer-flavored than extracted; and I believe the real foundation for this belief lies in the fact that honey in sections is generally produced from foundation (comb-building keeping pace with the storage), while the extracted is almost invariably stored in full-depth extracting-combs. My second reason for favoring the shallow-depth drawn (or level) comb is that the bees have a chance to work the cell walls over, where, if they were full-depth, they would let them alone. In any case, full-depth or not, one object of leveling is to take off the top of the cells the slight ring of wax that the bees always leave, because the cell walls themselves without this ring would not be strong enough to withstand the constant travel of the bees.—ED.]

By R. C. Aikin.

#### FOUNDATION FASTENER.

It seems to me there is yet much imperfect work in fastening foundation in sections. I have used the pressure method, pressure and heat combined, and heat alone. Here is a test to prove to any one who will try it that pressure or mashing it on is not good work: Press on a piece of foundation, then bring it into position in which it should hang, and look closely at the point of contact with the section. Here is an enlarged view of how it will appear.

The foundation is pressed into a wedge shape, the thin edge of the wedge adhering. If the wax would adhere before being cut partially off, there would be no difficulty; but as the pressure increases, the wax is pressed out thinner; and by the time the pressure is heavy enough to make the wax adhere, the foundation is about half cut off; and as the sheet is bent to bring it to proper position, a portion peels from the wood.

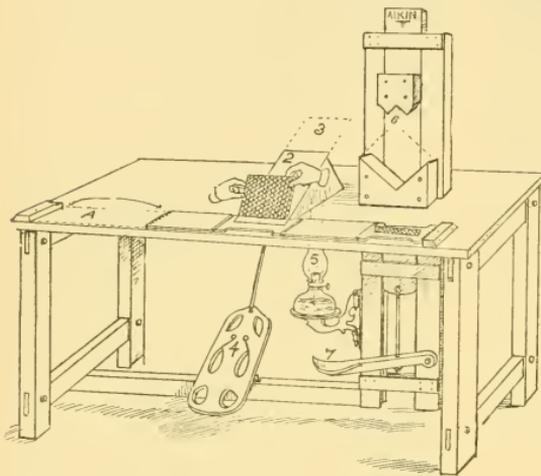

I have a rude machine that I have used for several seasons and it does good work. It is original with me, is not patented, and is not on the market, so do not order one, for I am not manufacturing them. It is a hot-plate foundation-fastener and section press, in one machine. I wish, however, to speak particularly of the fastening work, for that is the more important.

The plate stands at an angle of about 45 degrees, and the section is placed under the *lower* end. I put the foundation in before the section is folded. Here is the method. Before me at easy working height is a table (1). Above the table is arranged the plate (2), pointing toward me and downward, while under the table is the lamp (5) for heating, and a tread (4) that throws the plate forward (toward me) and downward, sliding at the angle at which it is set. The sections are previously dampened at the *grooves only*, by pouring a small stream of water through the grooves before opening the crate, or bunched. I pick up a section and put it on the table, and by the foot-lever throw the plate out till it rests on the section *just where the foundation is to go on*. While the plate was at rest, the wax left on from the previous fastening accumulates on the very end, and when it comes down on the next section the hot wax is at once, as it were, fried into the grain of the wood. The plate must be so hot that it will instantly melt the edge of the sheet of wax when applied, and the wax must be quickly applied and the plate withdrawn *before the section is heated*, and the foundation set in the line of the melted wax on the section. The plate must be hot, the section and foundation *both cold*, then the wax sets or hardens quickly. Just as soon as the foundation is in place, and almost as rapidly as one can handle the sheets, the wax will be cool enough to almost support the foundation in an upright position. I use a bottom starter and put it on first, then put on the full sheet and support it with my fingers while I pick up the section and bring the ends together with the foundation in a hanging position, place the section in the press, and fasten it, and at once set it in a super.

The illustration shows the starters on in such a way that, when the section is in the hive, the dovetailed corner is down. This is the way many use it, and has in its favor the fact that the dovetailing does not show so plainly when the section is set right side up. Some also prefer them so because, otherwise, when they take hold of the top to lift a section, the corner is apt to pull loose. The former idea in regard to appearance has some little weight, though not enough to be seriously considered; but the latter has no weight whatever, because when once a section is properly filled with honey any pull that would pull out the top is altogether unnecessary in any manipulation.

I prefer to put the bottom starter where the illustration shows the full sheet being put on, and the full sheet or top starter on the end where appears the bottom starter, so when I lift the section from the table to place in the folder I have the full sheet *hanging* instead of *standing*, and the dovetailing comes up under the head-block just above the numeral 6. The folder (6) is set just as close to the plate as it

can be, to have it as nearly as possible immediately in front of me. As the pressure necessary to close the section is much greater than that used in operating the plate, I put the folder to the right, that the right foot may operate the lever (7) in closing the section.

I think all will see at a glance the manner of handling the section while putting on the foundation. The little blocks at either end of the table are so placed that, when the section is shoved to one end, it is just right for the bottom starter; and, shoved to the other end, just right for the top starter.

The illustration I have prepared for this is not just as I have my machine, and not what it should be. The machinery I use in operating the plate and folder is not all shown. It would require two or more engravings to show it all. This, however, shows the manner of getting the foundation on and the section closed, which is what I wish to write of here. To illustrate in detail, so that one may copy exactly in building such a machine, is rather beyond my skill as a draughtsman, and no doubt more than the editor would care to have engraved.

As for the work of this machine, it is first class. When it is operated rightly the fastening is so perfect that the foundation will part somewhere else before it will let loose from the wood.

The only difficulty is in getting the section closed without injuring the fastening by springing the top by the heavy pressure needed to set the dovetailing, or by allowing the sheet of foundation to lop over when neither soft nor hard. It requires some pretty good judgment to handle it just right, and something that is very hard to tell.

The reason for putting foundation in before

folding is because of the difficulty of getting the fingers in to hold the foundation when the section is folded. I had intended to devise something to hold the foundation, and to cut off the required length, though up to this time I have never had the time to accomplish it.

These things might be developed faster if some inventive genius could receive the proper stimulus; but as it now is, the man who invents some good thing is usually more of a benefactor than benefited. I have been told—but can not say as to the truth of it—that some manufacturers of large means and extensive works keep one or more experts in their establishments, whose duty it is to study out better methods and improvements.

That bottom starter is a grand thing. I have just read in the *American Bee Journal* some of Editor York's experience in getting a lot of broken-down comb honey. The total shipment was 2300 pounds, and 550 of that broken down—almost one-fourth of it. I have had a little break down myself, but I know it is possible to have sections so firm that nothing short of smashing the case would break the honey loose from the section. I have had some such, and know whereof I speak, and know that bottom starters are a great help in getting such. There should always be a bottom starter, whether only starters be used or full sheets.

The producer of comb honey for the general markets can not afford to do any half-way work. There must be no foundation pulling down in the section, and there must be no breaking-down of the finished product in the case. I know what it is to have fine plump finished sections, and I know what it is to have such poor finish that I hardly dared to hold the section sidewise for fear the honey would drop out of its own weight. I must say that our honey is put on the market in a crude way, and especially is this true of the extracted product. Loveland, Col.

[I agree with you that the heated-plate plan gives a much better fastening, and I may add the work is more rapidly done. While some prefer two machines in one (folding the section and fastening the foundation) we prefer two machines—one for each operation. We find the two are more rapid, simpler, and cheaper than any combined machine we have ever operated; and we have tried a good many. We have never tried the Aikin machine, and, of course, are not prepared to speak of its merits. —Ed.]

## THE GRANULATION OF ALFALFA HONEY, ETC.

CAUSE OF BODY AND PROPER MANIPULATION  
 CAUSE OF GRANULATION; ALFALFA AND  
 SWEET CLOVER THE HONEY-PRODUCING  
 PLANTS OF THE FUTURE

*By Emerson Taylor Abbott.*

I have read with considerable interest Mr. Alkin's article on alfalfa honey; but as his experience and mine are not in full harmony, I wish to make a few remarks on the subject.

There are some things which occur under the operation of what we call natural laws with that unerring certainty which enables us to say positively that they are so and so, but the granulation of honey is not one of them. The reader will more thoroughly understand what I mean when I say that I now have in my possession alfalfa honey of last year's crop which has shown no signs of granulating. I have had alfalfa honey from the same party, Mr. Oliver Foster, of Los Animas, Col., for a number of years, and my experience with it has been invariably the same.

I know that, generally speaking, alfalfa honey granulates very quickly; but I am inclined to think that this is due more to the way the honey is handled than to any inherent tendency in the nectar of the alfalfa plant. I am well aware that there is a wide variation in the body and appearance of the honey found in the open market which is known as "alfalfa." I am not inclined to think this difference results from the locality in which the nectar is produced. I think it was Dr. Miller who offered the suggestion that alfalfa from different localities might show different characteristics; but I hardly think this is true if the honey is absolutely pure alfalfa, and is handled in the same way. I think that the variation in color is due almost, if not entirely, to the fact that the nectar of other flowers has been mixed with that of alfalfa. The "body" and flavor of the honey is due largely to the method of handling it. Especially is this true of the "body," a very important factor in the make-up of a fine quality of extracted honey. I am also of the opinion that the tendency to granulation is largely due to a lack of "body." This is strikingly illustrated in the basswood honey of my own State, when it is thrown out of the combs before it has been thoroughly ripened by the bees. In a word, I incline to the opinion that the great tendency to granulate shown by extracted alfalfa honey is due to improper manipulation, and I would advise the other extracted-honey producers of Colorado to take a few lessons from Mr. Foster, and to work for *quality* rather than *quantity*, and then they will not say that all alfalfa honey will granulate in a very short time. I know from experience that it will not.

I do not think there is any finer honey in the world than extracted alfalfa when it is properly

handled from start to finish. It is the only honey that I have ever seen that can be used for general sweetening purposes without spoiling the flavor and desirable qualities of some articles of food into which it is put. Especially is this true of all drinks, such as tea or coffee, which, by the way, I seldom use.

I look upon alfalfa and another member of the same family, sweet clover, as the honey-producing plants of the future. The honey produced from the nectar of these two plants is very much alike, as is also their habit of growth, even though one is a biennial and the other a perennial. Opinions seem to differ about as widely as to the merits of sweet-clover honey as they do as to alfalfa; and I am inclined to think that this also results from a mixture of the nectar of other flowers with that of mellilot. All of the pure sweet-clover honey that I have ever seen (and I have had considerable experience with it) has been uniformly of the best quality. My experience has been confined entirely to the honey from the white variety. There may be some difference in the honey produced from the yellow or blue varieties. The former runs wild in Great Britain, and we are told that the "herbage is relished by cattle." The latter is a native of Africa, but is cultivated in Europe, and is used in Switzerland for flavoring a certain kind of cheese.

I apprehend that the two plants are sometimes confounded, as there is also a yellow-flowered variety of alfalfa, which is a biennial the same as mellilot. The name, Bokhara clover, being applied to it, tends to confirm me in this opinion, as lucerne is extensively cultivated in that country, and I find no mention of sweet clover as one of its products.

St. Joseph, Mo.

[The alfalfa honey that has been produced for us by W. K. Ball, of Reno, Nev., has been no more inclined to granulate than any other honey. In fact, I believe I should have said that it was less so. The honey that we have received has been of heavy body and of extra fine quality.—Ed.]

## SUPPOSED GRANULATION OF ALFALFA COMB HONEY.

THOSE HONEY CARAMELS OF DR. MILLER'S;  
 CREATING A MARKET FOR GRANULATED  
 HONEY.

*By F. L. Thompson.*

On page 115 Mr. Alkin braces himself for a thumping. I'm not big enough to administer it, but I'd like to ask a few questions.

Is it not true that there is a marked difference between early and late honey in this respect? Is it not true that early alfalfa comb honey, kept in a warm dry place, will generally pass the winter without granulating? Is it not true that early honey constitutes the bulk of

the crop? Is it not true that there are enough No. 1 sections among the late honey to account for the prevalence of the general idea that alfalfa comb honey candies quickly, and that that idea would never have been formed in the minds of persons who had never bought any but early honey, or in the minds of honey-producers who had taken care to keep the two crops separate? How is it that not more than two cases were candied among 6000 pounds sold in March, 1893, by a Denver bee-keeper? In 1892, 60 lbs. of my early honey were kept until late the following spring before being used up, without showing any signs of candying. Others besides myself have had the same experience. The same season, the late honey was candied before it was taken off the hive. But that was an exceptional year for the rosin weed Mr. Aikin refers to. (I think its botanical name is *Grindelia squarrosa*.)

Referring to Dr. Miller's suggestion on page 113, I do not think honey caramels are what I am groping after. They may be delicious, but they have to compete with any quantity of saccharine-sweetened glucose confections. But honey itself competes with nothing, in deliciousness, at least, because, so far, nothing in this country imitates its precise flavor. Any kind of honey confections is not honey itself. I am not against all possible uses of honey, but I don't think it pays to make much fuss over them, for the reason that the same amount of energy expended in extending the consumption of honey itself pays far better.

The children of my customers got tired of honey just as quickly as adults, if I may judge by what was told me.

Referring again to Mr. Aikin's remarks on marketing extracted honey, here is some unexpected and very important confirmation, from a Colorado bee-keeper: "We put about 8000 lbs. of extracted honey on the market, in lard-pails, last year, and think it the best way we have found. The three-pound lard-pails hold five pounds, and the five-pound size seven and a half of honey. We fill them from the extractor, and let them granulate, then put on a neat label with instructions for liquefying, and state that Colorado honey will always granulate if pure. Three years ago we could hardly sell a pound of it granulated. Now we can not produce enough to supply the home demand. This last year we have had orders from several towns and many other places, and not one complaint."

Now, who says it does not pay to sell granulated honey? I don't think it comes very near the truth to say that "people never read labels."

Does not the distrust of marketing granulated honey arise from allowing the honey to granulate in the hands of the consumer? Has anybody ever made a fair trial of selling honey

after granulation, and failed? Let him hold up his hand, and tell us why.

The above was written before Geo. L. Vinal's article came to hand. I see he says, "Not half of the people read the directions." But whether they do or not, how did those four tons of granulated honey get sold in one district? When people buy granulated honey, they can't help knowing what they are doing; but when they buy something that needs careful explanation *afterward*, we all know how many of them will be so smart that you can't tell them any thing.

Denver, Col., March 23.

## HOW TO KEEP INSECTS OUT OF COMB HONEY.

By Prof. A. J. Cook.

Your inquiry from H. Price Williams, forwarded to me, has awaited opportunity to answer until now. Mr. Williams wishes to know if there is a paper made that is absolutely insect-proof. He says he wants something that he can wrap cases of comb honey in so that it can be kept until sold. Mr. Williams states that in his region (Miami, Florida) red ants and every other conceivable insect abound in inconceivable numbers.

The problem which Mr. Williams sets for solution is very much the same which confronts us who make collections of insects and plants for our cabinets. There is, however, one difference in the cabinet—we are not careful to avoid ill smelling substances which might be detrimental to honey. The first way we fence against insects in our cabinets is to use boxes which are so tight that no insect can gain admittance. I know from quite a long experience in producing and keeping honey that the same means may be successfully used in protecting our honey from our insect-marauders. A good way to make a cover that fits tightly (of course, there is no difficulty in making a perfectly tight box), is to set a rubber in a groove so that the cover will press upon it when closed. This is cheap, and absolutely efficient, as I have proved. I believe this would be the cheapest way to protect honey and also combs from insect depredation. We also find that certain substances like naphthaline, carbolic acid, and kerosene oil, are so offensive that their presence is almost sure to keep the insects from making an attack upon our museum specimens. It might be, however, that these substances would injure the sale of the honey, and so they should be tried before being generally adopted.

I think that, in most cases, simply wrapping such packages in paper will prevent insect attack. The thing to be sought is to keep the odor of the honey from passing through the paper so as to attract the insects. This might make it necessary to seal the package hermeti-

cally. To do this the bee-keeper has an easy method right at his hand. He has only to dip the paper in hot melted wax, getting just as little wax as possible on it. Then if he wraps the sections while the wax is a little warm he will so seal the package that no odor of honey can escape, and so the insects will not be attracted. I should have great confidence that this would work, but of course it would have to be tried before we would warrant it. I should also have great faith if we used paraffine instead of the beeswax.

California is much like Florida in this respect. The climate is so delightfully genial the year round, that it is a perfect paradise for insect life. The ant is on deck, gay and festive, every day of the year, and thus ever ready to become a nuisance in pantry or storehouse. For this reason extracted honey is more suitable for production in California than is comb honey. This is another reason, then, why the California honey-producer may well turn his attention to the production of extracted rather than comb honey. When the honey is thoroughly sealed in the tin cans it is entirely safe from any such molestation.

Claremont, Cal., April 1.

[I know that bees seem to have an aversion for paraffine paper, or, in fact, of any thing paraffined; and I was under the impression that certain other insects seemed to show a dislike to its slight flavor of kerosene. A package of comb honey can be wrapped in it, I am told, so that it may be sealed hermetically by placing a flatiron over the folds until the paraffine melts, when the iron is released.—ED.]

## BEES AND GRAPES IN CALIFORNIA.

VALUABLE TESTIMONY FROM ONE WHO PRODUCES HONEY BY THE 40 TONS AND RAISINS BY THE CARLOAD.

By *G. F. Merriam.*

In the discussion of the "bees and grapes" question in the papers, I have waited, hoping some one else in this State would take up the subject; but as no one has done so I will give my experience, which runs through 16 years.

I happen to own a vineyard planted in 1880 to the raisin grape and wine varieties. I have kept from 100 to 500 colonies of bees within  $\frac{1}{4}$  to  $\frac{1}{2}$  mile of this vineyard all these years, and have made raisins by the carload, and honey in 30 to 40 ton lots at the same time; so I presume I may write understandingly.

One year I shut my bees in their hives four to five days at a time, releasing them for an hour or so just before night, closing at daylight the next morning; but it was a useless labor, because bees came from every point of the compass to do the same work I tried to keep mine from doing. My experience tallies exactly with that of the Dadants and others, who own large vineyards—that bees never touch a fresh grape

until the skin is broken by birds or some other means.

In raisin-making, the grapes are laid on trays made of thin shakes 2x3 feet square—each tray holding about 20 lbs. of fresh grapes, laid one layer deep only. In the picking and laying out, more or less of the grapes are slightly loosened from the stems, whence a tiny drop of the sweet juice comes out; and as the trays are laid out on the drying-beds, or in the rows between the vines, the pickers are followed by a swarm (almost) of bees, which run over the bunches and speedily clean up all of these little drippings.

Within ten minutes after a tray is laid out to dry, all the bees have left it and gone to the next later picked, and so they follow the gang of pickers day after day.

The bees let the grapes alone then for about ten days. When the upper half of each bunch of grapes has turned brown, small wrinkles appear in the skin of the grape. As long as these bunches remain dry, the bees let them alone; but if a heavy dew or fog or light shower falls on the grapes, early in the following morning, while the skin is yet wet and soft, and while the grooves in the skin furnish a chance for a bee to get hold, they will tear open the skin of a few of the sweetest grapes, and for several days from three to fifty bees will be seen on that bunch, patiently eating away at the half dried grape, and keep at it until only seeds and skin are left. A good-sized bunch will keep a gang of bees busy over a week before it is all gone. The bees act, while eating these grapes, as if they were eating candy. They get quiet, and act as if half torpid, and scarcely fly when brushed off.

The loss to the raisin-maker by this is not very material—furnishing only a little more offal when run through the grading-machines, which are large fanning-mills arranged so the sieves sort out and drop the different sizes of raisins into separate boxes.

In wine-making, if conducted outdoors, the crushed grapes attract the bees in clouds, and force the wine-maker to do the crushing in a house.

The year 1894 was exceedingly dry here; and by fall, when we began making wine and raisins, there was scarcely any honey left in the hives, so the bees carried in the juice, which dried in the cells into a brown, sugary mass. This juice was placed around the brood, the same as honey, and the next spring these combs in colonies that had become disgusted with the sour ill-smelling stuff, and gone off to hunt a sweeter and better home, were unfit to use without cutting out this candied grape juice. In most instances the bees carried this out like candied honey; in others it was cut out and rendered for its wax. I think it is a detriment for bees to have access to grapes in quantities

sufficient to more than meet their daily wants. That bees will live and breed and do fairly well on fresh grape juice alone, in a season of drouth, I am certain.

Three Oaks, Cal.

[Our testimony is very valuable, friend M., and our only regret is that there are not more such men as yourself who are willing to give from their store of practical experience.

It is pretty well settled now that bees do not themselves puncture fruit, although we have to admit that they often help themselves freely to that which has been broken in handling or which has been punctured by birds or other insects. Although the bees do bother in raising-drying time, it is evident that friend Merriam manages to produce raisins and honey simultaneously, without any very great inconvenience. This goes to show that the damage on the part of the bees can not be very great. That being the case, the honey-producer ought to be able to make some reasonable and fair compensation to the raisin grower in his own immediate vicinity. If the damage is only slight, a very moderate compensation would suffice. We shall hope to hear from friend Merriam again.—Ed.]

---

### "CAN EXTRACTED-HONEY PRODUCERS AFFORD TO BE HONEST?"

A TEXAS BUG-RAISER'S OPINION.

By W. W. Somerford.

I see in GLEANINGS, page 193, the question raised, "Can extracted-honey producers afford to be honest?" I say, yes—surely they can if the chance for cheat and rascality lies along the line of glucosing honey in order to get a little more out of a crop; for unless they can beat me selling honey in the way of *getting a good price*, they would be left buying glucose at the price it brings down here (taking it home, and mixing the stuff in). Hauling, handling, and paying freight on the stuff would more than cost the *little possible gain* a chap *might get*.

My experience has taught me that people who buy honey know just what it is. I used to be so well up on peddling honey that I fancied I could tell a would-be customer at sight. Just one good look at his face generally told me whether there was much chance to make a sale or not. Then when the question comes to an honest man, with an honest man looking him *square in the face*, "Is your honey absolutely pure?" what kind of stuff would a fellow be who could face an honest man and sell him glucose to take home to his wife and family for an *extra treat*?

Peddling, I am sure, would be the only chance for a fellow to make way with a honey and glucose mixture; and as peddling is something bee-keepers who produce honey in large quantities won't generally do, except in drummer style, there is not any danger of glucosed honey being sold by bee-men in quantities. I have sold honey often by the barrel, to grocers who

would conduct their mixing experiments (with me present) before purchasing; and I am sure there are not many honey-eaters who can't easily detect 25 per cent of glucose in ordinary honey, taking ordinary glucose to make the mixture.

So, in conclusion, I will suggest, that, if a man has energy enough, with sagacity enough (mixed in) to sell glucosed honey at a profit, he is amply qualified to go at and make a success of some business that will pay him many more dollars, and give him much more satisfaction than he could ever get peddling out a fraud to his neighbors. A good bee-keeper can make \$300 or \$400 a month during the time he has his bees to attend to, and it would take a hustler with glucosed stuff to clear \$100, or even \$50 a month.

Navasota, Texas, Mar. 28.

[I am glad you have answered the question in the affirmative; but I do not believe I could agree with all you say. I wish it were indeed true that all glucose mixtures, if disposed of at all, would *have* to be sold by the laborious and disagreeable method of peddling. But I am afraid many consumers are so gullible, and so unfamiliar with the real flavor of pure honey, that they get the glucosed honey without the medium of a honey-peddler. They buy it right in the open market because it is cheap and "looks nice."

I once took the ground, as you do, that there were not very many honey-eaters who could not detect 25 per cent of glucose in honey. While I now believe that ordinary commercial glucose can be recognized in such quantities, I know there is a *fine* quality that could not be *certainly* detected when used to the extent of even 50 per cent as an adulterant. Generally speaking, however, I believe it may be true that one who knows the flavor of good honey could detect the ordinary commercial glucose even when only 10 per cent is used—at least, that was my experience if I may call myself an expert in glucose-tasting; for you may remember that, two years ago, I was able to detect, almost unerringly, by the mere taste, glucose mixtures of 10, 25, 33, 50, and 75 per cent, and, in most cases, the approximate percentage of adulteration, just by the mere taste. But the glucose used as an adulterant was the commercial article, the brassy metallic taste of which is very pronounced, even in small percentages of adulteration.—Ed.]

---

### FANCY COMB HONEY.

ARE THE GRADING RULES IN FORCE TOO RIGID?

By T. F. Bingham.

On page 45, present volume, I notice objections to the present plan of grading honey. An old adage is, "He builded wiser than he knew." That is the upshot of the present grading. Said plan contemplates only the benefits accruing to the bee-keeper having honey to sell. Nothing is best which is not good for all.

The conditions which render the grades fancy are not merely the looks and appearance but the quality. It is true, that irregular thick-

nesses of combs do not impair the quality of the honey, which, though ill formed, has been made under the same practical conditions as that which has been stored according to the higher art of modern bee-keeping.

The word "fancy" means, as used in grading comb honey, vastly more than shown. It means the best honey stored when that particular crop or flower product was approximating its climax, and not its decline. The combs are white, made of *new wax*—not of old gnawings brought up before new wax was secreted. The corners were filled out because the honey-flow was strong; capped up because the honey was ripe and ready to cap.

Honey made under such conditions should bring more money than honey put up in drawn combs, half of which has been brought up from the previous years' gathering, to make room for brood, and capped with scraps of propolis, or left uncapped along the edges. When exposed to cold and damp, it has undergone such changes that it is made faulty in other respects than in appearance.

Were it possible for the bee-keepers to raise the fancy or best honey, and market it directly to the consumers, only a very short time would be required to establish a market almost without limit for fancy honey. The consumer would soon find that *fancy* meant more in the selection than the word "honey" implies. It is from the general meaning of the word honey that consumers lose their appetites for it. "Fancy" honey stimulates the appetite and increases the demand.

Farwell, Mich.

[Mr. Byron Walker, and some others, take the ground that the "Fancy" in the Washington grading is drawn down too fine. In fact, Mr. Walker once advertised that he would pay a dollar a pound for all honey that would be sent him conforming *exactly* to the requirements laid down in the *Fancy*. He says he was perfectly safe in making the offer, for he never got a pound. Mr. Bingham's point, however, is good, a *fancy* article of honey should be *fancy*. Perhaps the trouble is our description for that term is not comprehensive enough.—Ed.]

## WHAT ABOUT THE SELF-HIVER ?

HOW FAR WAS IT A SUCCESS ?

By C. H. Dübbern.

Somehow a strange silence seems to have settled on the self-hiver of late, and I suspect none of the various inventions have proved very successful. Judging from my own experience, extending over a number of years, I should say that the perfect self-hiver is an impossibility; and yet the impossible of to-day may be the accomplished fact of to-morrow.

No doubt many a bee-keeper, having an out-apiary or two on his hands, is anxiously looking for something of the kind—something, you

know, that will hive the swarms when they issue during his absence, change over the honey-cases, remove old colony to a new place, etc. One man wrote me that he wanted a hiver that he could put on his hives in the spring, and place the empty hives, provided with honey-sections, on them; and when he called around in the fall, to find the swarms all safely hived, honey-cases all filled, and every thing lovely. That would be very nice, and almost any one could go into bee-keeping, and make it a success.

Now, the trouble with all self-hivers is that where bees issue out from the hive they will also return again when they miss their queen. If the queen is trapped in a new hive, or in a queen-trap, only a handful or so of bees will remain with her; and if more bees are not given her within a few days, she will either die or get lost in some other way.

My latest device, as described in GLEANINGS, has proved reasonably successful in my own experience. If I am present when the bees swarm out, I have only to close up the direct entrance; and the swarm, upon their return, finding their queen in front of new hive, and no way to get back into their old hive, have no choice but to go into the new hive. In this way I get good-sized honey-gathering swarms, and I usually change over the surplus arrangement at once, but it will not do to leave the old hive more than a day or two without giving them a direct entrance of their own. At first I thought it would be a nice thing to allow the bees from the old hive to reinforce the new swarm for a week or two; but I soon found that perhaps, for want of water, the bees in the old hive would destroy the unsealed brood, and in about two weeks the hive would contain nothing but comb and a very few bees. The new colony would prosper greatly, however, and possibly this may be a point for those bee-keepers who want no increase.

The main advantage I claim for my device over the queen-trap is that, when a swarm issues during my absence, almost any member of the family can take a smoker and close the entrance to old hive; and when I return in the evening I find the full swarm nicely hived, and can then fix them in a moment to suit me. With the drone-trap I should have to divide the bees, as but a small handful would be found with the queen in the trap.

Some of the drawbacks I have discovered are that the bees dislike traveling the whole length of the new hive before they can fly. They are also liable to become sulky, and try to gnaw holes where the bridge covers the space between old and new hive. Still I believe I can overcome these objections by a more perfect arrangement, and allow more space through the zinc—four rows of perforations instead of two; but further experiment-

ing is necessary to make it an entire success. Until we have something better, bee-keepers had better stick to the Alley queen and drone trap for hiving-purposes. Indeed, where one can be present, or have some competent person there when swarms issue, nothing better can be desired. With my arrangement I usually allow the bees to swarm out once through the swarming-device, and return before preparing the new hive to catch the swarm. This saves much work in preparing new hives for each colony, many of which might not cast a swarm at all. As the back of my device will allow bees and queen to pass, but exclude drones, I cover it with wire cloth when used as a queen-trap. This enables me to see readily when a hive has swarmed during my absence.

I have no patents or swarmers for sale, and the above is written simply to show what progress has been made.

Milan, Ill.

[The self-hiver (the Pratt) worked very well with us. Several summers ago it hived over half our swarms; and while I was pleased with its working at the time, it required special fixtures, some tinkering and patience to make all go right. I am not sure it was very much ahead of entrance-guards or the Alley trap.—Ed.]

### BEE-ESCAPES.

HOW THEY SAVE TIME, AND PREVENT ROBBING.

*By F. A. Snell.*

The bee-escapes now in use are of much value, and I would not think of doing without them, even if the cost were much more than it is. Every apiary should be supplied with them. There are times when I do not care to use them very much. In removing surplus comb honey, if this be done during a good honey-flow, I simply remove the supers from the hives and place them to one side in the backyard, in the shade, and in a short time the bees will have left them, and I then carry them to the honey-room.

In extracting honey under the same conditions as to honey flow, the work can be done by the shaking-off plan very well; yet for this work I rather prefer to use the escapes, as it causes less confusion among the bees, and their work is not retarded in the least; and I think the work of the operator is thus made more pleasant. It is essential that the escapes be put under the supers to be emptied 24 hours, or the day before the extracting is to be done, so the supers may be clear, or nearly clear, of bees. With all colonies I put over the brood-chamber a super of empty combs; the escape on top of this, and the filled super over this. By so doing, the bees have abundant room in which to store the honey being gathered, and seem to leave the upper story a little sooner. Another advantage is, that none of the newly

gathered nectar is in the supers to be emptied, which would be the case where only one super is used and the shaking-off method practiced. This gives us honey of a little better quality than if the escape were not used, and no palms should be spared so slight as this to better the grade of honey. The above applies to times of good honey-flow more especially. With us these occur during warm weather, when, if the honey be cooled a little by the exclusion of bees, no inconvenience from this results. Later, as the honey-flow begins to slacken or is closed, comes a time when the escapes pay their cost very quickly, to the delight of the apiarist. Before the advent of the escape, taking off surplus at such a time was very unpleasant work, and required the best efforts of an expert to keep from demoralizing the whole apiary, especially when extracting. Now all this is changed, and an unpleasant task made easy, by the escapes. Thanks to inventive genius.

During a time of scarcity we do not in our apiary take off any surplus except by the aid of these. The supers are simply raised up (using a little smoke to keep the bees under control), the escapes placed, the super set on, and we pass on to other hives until each super has been arranged as described. The comb-honey cases will be cleared of bees in a few hours, and can be removed and taken to the honey room. The extracting supers are managed the same, only a longer time is needed to get the bees out of these. Thus hundreds of pounds of honey can be taken from the hives, and at the same time perfect order reigns throughout the apiary. Work goes on in perfect order. How different from the old way, under same conditions! The air was then filled with robber and angry bees stinging each other, and by no means neglecting their owner. I have used the Dibbern, Hastings, and Porter escapes. The Porter has proved to be the best one, after a thorough comparison. The bee-escape has come to stay as a boon to bee-keepers, and one of the most useful implements.

Milledgeville, Ill.

[Our experience has been almost identically yours. I can not conceive how any one can prefer the shake-off brushing plan to the bee-escape method. To shake the bees off the comb causes more or less spilling of honey not yet ripened down, and for an hour or so that colony is so completely broken up that honey-gathering is entirely suspended. After crawling into the hive, if they do not stop to do it before, they have to lick each other off; then if it is during the robbing season there are plenty of other bees that are prying their noses into the other bees' business; then the shaking and brushing necessarily results in killing and maiming a few bees at least, and the possible loss of the queen; and, moreover, it requires a large expenditure of strength to shake the bees off from every comb. My last experience resulted in blistering my hands and giving me a lame back for several days afterward; and I vowed then and there that for me, at least, the bee-escape should be hereafter used.—Ed.]

### HONEY VINEGAR.

WHY IT "EATS" PICKLES; HOW TO MAKE GOOD HONEY VINEGAR; WHY IT CAN'T COMPETE WITH THE VINEGAR OF COMMERCE; A VALUABLE ARTICLE.

By E. Whitcomb.

On page 234 Mr. C. Davenport complains that honey vinegar eats or softens pickles. This is not necessarily the fault of the material of which the vinegar is made, but because the vinegar is too strong. Vinegar made from any other material, and of double strength, will soften or eat pickles; and we think if Bro. Davenport will reduce his vinegar with water nearly a half, or to about forty-grain strength, he will not complain of its eating or softening pickles. One pound of honey ought to be sufficient to make one gallon of good vinegar. However, its strength is entirely regulated by the amount of material used; and it can be made of triple strength, or about ninety grains. Where an inferior or low-grade honey is used, the fluid, before it is finished, should be run about twice through a generator, during which process it should pass through bone charcoal.

I have been unable to notice any material difference in the strength or flavor of vinegar where the generator process is used. Of course, dark honey will make a darker-colored vinegar, while the lighter honey will make an article almost as clear as water.

A honey-dealer in Ontario wrote me, after the Lincoln convention last fall, inquiring why we did not manufacture honey vinegar, and thus create a market for low-grade honey. The vinegar of commerce doesn't cost, for the material there is in it, to exceed one cent per gallon, either made from corn or any of the cheap syrups, and sold on the market as pure cider vinegar; and it can be made pure without any acids or adulterations at the above price, barring the labor of making it; or, in other words, the barrel costs more money than the vinegar which it contains.

There is no article of universal use in the household, upon which the general public have so little information as vinegar. The whole secret of vinegar-making quickly hinges upon how much you can expose the fluid to the air at a temperature of seventy or more degrees of heat; and good vinegar may be made from cider, honey, or syrup, within the space of 24 hours; and the reason that we can not make vinegar out of honey, and thus create a market for the low grades of honey, is because no one will sell his honey at less than one cent per pound. If he did, honey vinegar would go into competition with corn and syrup vinegars.

This is not material with the man or woman who has a few pounds of inferior honey which they desire to convert into vinegar. We would use one pound of honey to a gallon of soft

water, setting in an open barrel, and covering with thin cloth to keep out insects and dirt; and after the barrel is filled we would add a gallon of good yeast to every barrel, stirring up occasionally for the first three weeks, when the result will be very good vinegar. When sufficiently strong, draw off with a siphon, such as can be drawn without sediment, and make the second barrel in what is left in the barrel, and you will find that the second lot will make much quicker than the first.

Of course, the strength of the vinegar will be gauged entirely by the amount of honey used. Vinegar is an industrious fellow; but when he has used up all the materials you have given him to work on he will stop; nor will he stop until he has accomplished this.

Of course, it must be borne in mind that a temperature of above 70° must be kept up, either by the sun's heat or by artificial means, during the process of making.

Friend, Neb.

### HOW I SOLD HONEY.

SOME OF THE DISAGREEABLE FEATURES OF THE BUSINESS.

By Alice Harding Crossman.

While I was very busily engaged preparing dinner I heard a loud knock. I opened the door, and found a tall gaunt old man, apparently a gentleman:

"Have you honey to sell?"

"Yes, sir."

"What kind?"

He waited at the door while I brought a sample. Then he gave me a lengthy description of his physical condition. He had nervous dyspepsia. Did I think honey would hurt him? I told him it would do him good. I could smell something burning. I darted into the kitchen, and found the potatoes burning. When I returned, the man had decided he would take half a pound if I could let him have a can to put it in. He hastily explained that he would find if it agreed with him. I found a baking-powder can. Guess I had better get a supply of old cans if my business keeps like this. Dear me! a whole nickel's worth! I knew this old man was very rich. Five cents wouldn't pay for the time I had lost and those potatoes! It will be better soon, I thought, as I set the table. Shortly after dinner I opened the door to see a gentleman, really and truly a gentleman. He stood with hat in hand. "This is Mr. —'s place, I believe?"

"Yes, sir."

"I wish to get \$1.00 worth of honey."

"Do you wish to see it?"

"No, I know the honey. Can Mr. — deliver it?"

"Yes, sir."

He gave me his card, and, with "good-day," walked away.

"Now, he is a daisy. Yes, sir; if all of my customers were like that."

But I noticed the address was that of an old customer. After all, the sign had not brought this one.

I had just reached the baby when another knock. A German this time, with a large sack of beeswax. He said he wished to sell. But Mr. —, I knew, didn't want it.

"Vel, I leaf it here; he take it."

He put the sack down, and asked questions about the sign and honey. At last he went away. Not another customer came that evening. I felt glad.

The following morning I was hoping no one would come, when, rap, rap! and there was an old man with a ten-pound lard-bucket. He came in, and told me how much he paid for honey during the war. He at last told me he wanted honey, but wanted to taste some of it first. I went into the kitchen. He followed, and sat down. I gave him a "taste." He thought it was not as good as honey he bought during the war, and we asked too much for it. He said he would take ten cents' worth. When I weighed it the bottom of the bucket was scarcely covered. He seemed content to sit and talk.

"I can't waste my time," I thought. I proceeded to skim my milk. Then he gave me full directions how to make butter, and also gave me all the "inside secret in raisin' bees." Yes, he was very wise.

I had finished my milk before I opened the door for a little boy who wanted honey for his ma, who had a bad cough. I filled his cup, and he departed. After receiving another lecture from the man in the kitchen I found he was really going to leave. Then I found a little time to get dinner. I was trying to finish washing the dishes, when I heard a knock. I hastened to the door. Four ladies, handsomely dressed, stood on the porch.

"Will you come in?" I asked.

"Yes, thank you, we have time," one said.

They filed into the parlor. When they were seated they began to talk. Yes, they were very talkative. At last they decided to buy a fifty-cent bucket of honey. It took them just one hour to decide. Oh how glad I was when they went away!

I had just put the baby to sleep, when knock! knock! It was for two young women this time that I opened the door. They had such merry laughing faces I said, real pleasantly, "Come in."

In they came, and sat and talked until sun-down; but they bought two bits' worth of honey. I laughed as they rode away on their donkies; but my head ached so bad I concluded I was tired of selling honey.

The next morning I found I was sick. My husband went for a colored girl. When she came I said, "Millie, do the best you can."

After a good nap I felt better. I thought I would go to the kitchen; but while I hesitated, there was a knock at the door.

"Go quick, Millie," I said to the girl. She obeyed, and came back followed by the strangest looking woman. She stood staring at me. Millie looked at me and grinned.

"Good-morning," I said.

After a little she said, "Mornin'! are you sick?"

"No, not much," I answered, smiling.

She was very slender; her face was small, and had a pinched expression. She wore an old-time short-waisted calico dress. She wore a hat—ah that hat! It was almost as large as a peck measure. I never did see any thing like it before. It seemed to be made of shucks. It was lined with green silk, and the outside was loaded with green ribbon and bright flowers, with huge bows of bright-yellow bunting. The poor little head looked miserable under that hat.

"I come to git some honey, fur I seed you had some to sell. I wuz goin' by, an' I jest thought I'd get some. I live 'way up in the forks of the river. I'd like to get some honey if ye'll let me have a bucket to put it in. I don't want but a dime's worth."

On she talked in a queer, squeaky voice. I wondered if she would ever stop. She told me—I think she exhausted her supply of words—that she had determined in her mind she would get a bucket. I at last said:

"Go out to the honey-house; and if Mr. — is there, ask him about it."

She went, but she bought a bucket and the honey. She came back through the house.

"I got me some honey. I jest thought I'd come back an' see if you knowed of anybody what wanted work done. I don't want hard work, though."

"I will let you know if I hear of any one who wants you," I replied. "Did you say Mrs. Beat or Miss?"

"I'm a young lady—that is, I ain't married yet, but guess I am old 'nough, though."

With a few more explanations she then decided to go.

"Fo' de lan' sake! did you eber see de likes ob dat?" Millie said, laughing.

"No, I never did," I answered.

The following day I was myself again, and was determined not to feel worried. I was making my light bread, thinking how brave I would be, when bang! bum! bum! some one was trying to knock down the front door. I tried to get the dough off my hands. Open went the door. In came that horrid old man, carrying his fruit-jar half full of honey. "Gracious! what can he be bringing back that

honey for?" I asked myself. He came blundering along.

"Got more honey?"

"Yes, sir."

"Then fill up this jar."

"Why," said I, "you haven't used—"

"No, but I was comin' back this way, and I was afraid I'd get out," he said. "But go 'head with your fixin's; I can wait."

I finished my bread, and he talked on. Then came the fun of filling that jar. He could not tell how I was going to know how much honey I had sold him. At last I made him understand. The honey was ready; he could go, but he sat down and talked about his chickens, his cows, and calves.

When he went away at last I was determined to have that sign taken down. "I must quit trying to sell honey, or go crazy. It might do in some places, but not here," I thought.

In the evening three men came horseback. They had been drinking. I was nervous when they left, and was glad to have the company of a woman who had come to buy ten cents' worth of honey. When my husband came in that night he asked innocently:

"How is the honey business?"

I just gave up and said, "I am tired; take down that sign. I just can't sell honey this way, and be tormented so. They don't come, buy honey, and go away, but they make me waste my time, spoil my cooking, neglect the baby, and scare me half to death."

How the partner of my joys did laugh!

"I thought you would get tired."

"Well, I tried, but I can't keep house and sell honey."

---

### PETTIT'S NEW SYSTEM OF PRODUCING COMB HONEY, AGAIN.

A REPLY TO BRO. DOOLITTLE.

By *S. T. Pettit*.

Brother Doolittle, I was pleased at your kind reference, on page 119, to my article on page 51; but you did not seem to see that I was not discussing the question as to whether the field-bees go right up to the supers and deposit their loads of honey in the cells, or whether they hand it over to younger bees who do the depositing. However, I did not intend to say any thing at variance with the fact that field-bees *generally* give their loads of honey to younger bees; but I am not so sure that they always do so under all circumstances.

Possibly you will point me to what I said in the following: "Now, as the bees come in they generally go up somewhere near the center; and as they find the sections advanced well nigh to completion the honey must go beyond." Well, I confess I might have been more specific

if I had thought it necessary. We say the sun rises, the kettle boils, John Smith is building a house, when in reality he has let the job to a builder, and he neither pushes a plane nor drives a nail. But why, under my system, do bees fill and finish the outside sections as rapidly and as well as they do any other sections in the super? is the question at issue. Let us consider the matter.

#### THE EFFECT ON THE SUPER WHEN THE HIVE IS UNDER A SHADE-TREE.

We all know that, if a hive of bees be placed under the side of a spreading tree or under any other obstruction, so that the bees all come in at one side of the entrance, said entrance being the full width of the hive, the work will progress more rapidly on that particular side, whether working for comb or extracted honey, than on the opposite side. The facts are simply as follows: Where the bees go in and up, there the young bees will in a measure congregate to meet them. If they go in and up at the center, the young bees will congregate there, and the outside sections will be more or less neglected; but when the field-bees distribute themselves, and go up at the sides and rear end of the hive, the young bees distribute themselves also to meet the field-bees where they go up; and as the dividers (see page 51) preserve a double bee-space, or, rather, two bee-spaces, at the outsides, room is provided and preserved for a double portion of bees—a nice little cluster along both outsides of the sections, and so the work at the outsides keeps pace with all other sections in the super.

Right here I may be allowed to make the claim that, under this system, more honey, and that in better shape, can be taken than under the old way of either comb or extracted honey. I do not use dividers for extracted honey, but I use the wedges for distributing the bees.

Brother D., what you insinuate about my bees being weak, or what you say about their getting strong enough, needs no reply further than to say that they are strong enough, and ready the year round, to take any crop of honey that may come along. I have no trouble in building up every spring; and, further, my hives are so constructed that the section supers will hold 36 sections each; and when the clover season sets in I put on these big supers, and the bees are glad to go up to get "standing" room. Of course, I select the strongest for comb.

Your caution about stretching the bees over too many sections will do good; but after all it is also a serious and losing mistake to fail to give the bees room according to their strength and the honey-flow.

To several swarms last year I gave 72 sections each in the start, and to some I gave 108. It is only fair to say that the latter got some bees from other swarms, and all the sections in these were well finished. But it is better to

give to few than too many; but who can tell, sometimes, just what to do?"

Belmont, Ont., Can., March 10.

[I didn't see it so strongly at first; but the more friend Pettit has to say regarding his new system the more I am convinced that he has got hold of a valuable idea. It is well worth a trial by practical comb honey producers as it will cost very little. The plan is given on page 51 of our Jan. 15th issue.—Ed.]

### J. VAN DEUSEN'S DEATH.

We have to record the passing from earth to a wider sphere of usefulness the veteran Justus Van Deusen, in the eighty-third year of his life.

We do not know what heaven is like; but we have a right to assume that those qualities of heart and mind that we are commanded to cultivate here will, under perfect direction, find wider scope and more ample employment in the hereafter. We rejoice that our friend was spared the period of decrepitude that usually falls to the aged. Attendants at our national conventions, no matter how distant, have usually found him present, displaying the vigor of body and mind of man a score of years his junior. His presence was delightful, and a visit with him was an incentive to the ways that lead upward. As his nephew, Capt. Hetherington, well says, he was a fine example of the Christian gentleman.

From early manhood to 1848 he was engaged in the jewelry business. In the year following, the Van Deusen family built the woolen factory at Sprout Brook, which he ran for many years until he converted it into a comb foundation factory. He was a fine mechanic, and was satisfied with nothing but the highest grade of material and workmanship. It is but justice to say that every skein of yarn and every foot of foundation turned out from his factory had worked into it the trademark of his life—the best. From small beginnings, because of the prejudices of bee-keepers against the flat-bottom cell, the trade in this foundation has steadily increased to large proportions; and the greatest tribute ever paid Mr. Van Deusen's good judgment is the recent adoption, by the most extensive manufacturers of bee-keepers' supplies in the world, of the flat-bottom cell in their highest grade of improved foundation.

He was the father of the late C. C. Van Deusen, the originator of several valuable inventions in bee-keeping, and whose tragic death, together with his wife, on their way to the World's Fair, so shocked the bee-keeping world.

P. H. ELWOOD.

Starkville, N. Y., April 13.

[Photo of J. Van Deusen has not come to hand. We will try to give picture in our next.—Ed.]

### THE NEW DRAWN FOUNDATION.

ARGUMENTS IN ITS FAVOR FROM A STRONG MAN

By P. H. Elwood.

You are to be congratulated on the success of your deep cell foundation. Should you never make it a commercial success it is a great mechanical triumph, and calls for the highest praise from all fair-minded persons. I showed your first sample to Capt. Hetherington, and he pronounced it *wonderful*—quite a contrast to the dog-in the manger treatment it receives from certain sore-headed persons. Many of these who have in the past used and sold heavier foundation than your deep cell now find that there is entirely too much "gob" and "fishbone" in yours, where a part of the wax is taken from the septum and put into the side walls.

Some of us for years have asked bee keepers and dealers, as a matter of principle, to abstain from the use or sale of thick foundation for surplus. What we have failed in accomplishing by appeals to the conscience, you make plain by one little jab at the pocket book. "Great is Diana of the Ephesians."

One of the chief merits of flat-bottomed comb foundation for surplus is the fact that it usually contains less wax than the natural base as built by the bees. The greatest objection to it with us is that the bees, during a scarcity of honey, will gnaw it more than the thick foundation. Occasionally they will remove the entire side walls, leaving only the plain sheet, after which it is entirely worthless except for remelting. What is needed to prevent this destructive work is a higher side wall, say one of a little less than  $\frac{1}{8}$  of an inch in height. Whether a side wall of sufficient height and thinness can be put on with a roller machine I can not say. I would not care for deeper cells than is sufficient to prevent gnawing. A deeper cell will cost more, of course, and, except for bait comb, is not needed; for with this start the average swarm will complete all the comb necessary to store their honey. Then, again, this depth of cell could be readily transported, while the deeper would be very bulky, and liable to injury. For bait comb and other special purposes there will be a demand for the deeper, if such can be made successfully.

I had written so far when the April 1st GLEANINGS came with the editorial on the deep-cell foundation, and I consider it complimentary to me that we so completely agree on nearly every point presented in this able article. Especially would I emphasize the fact that drone comb is usually thicker than worker. I have also noticed that both drone and worker are much thicker when built in large sheets in the brood apartment than when built in the small surplus-receptacles. It is also a fact that

drawn-out comb looked clean after extracting is much harder than the same set away covered with honey. In the latter case, however, the honey stored in them is much more liable to candy. Before the production of flat-bottom foundation, and when foundation for surplus probably weighed fully twice what it does now, Mr. J. E. Crane, of Vermont, visited us. He sunk the knife into a plate of honey, and, on meeting much resistance at the midrib, looked up and said: "Do you use foundation in your sections?" "I answered, 'No.'" Again he pushed, and again he looked up with inquiry, surprise and I mistrusted doubt, written on his countenance. The section of honey he had sampled was probably a bait comb wintered over, and drone.

For some years we have used in our surplus the Val. Deussen flat bottom foundation weighing not less than 12 ft. to the pound, and we have been spared any experiences similar to the above; for on the average our honey has less wax in it than natural comb honey. To disarm criticism, and because wax used in making foundation is not of as good quality as the newly built comb, I prefer to have the base somewhat thinner than the bees make it.

The samples from your new machine, are just received and show a marked improvement over the first. With my own and a single small thorough trial proves me wrong. I prefer the simple solid block side walls, and weighing 12 ft. to the pound. This must prove very adequate in both bees and economy. The part of the side wall that the hand sometimes is glued to both is at the very bottom deep cell is attached to the midrib. I notice in your samples that this part shows no groove. I have some better material put into the remainder of the side wall. The cell walls are sections of those samples are to them, and the quality of the wax is such, that after running a comb, I have not succeeded in cleaning a much better into a "gale." Thick foundation made of poly wax has the gold at both start and finish. I do not wish to flatter you; but I believe you have the most valuable invention of recent years in bee-keeping.

I do not share the opinion of some, that this invention, nor any thing else, will stop the production of extracted honey. Comb honey can not take the place of extracted for hot cakes and other domestic uses; also large quantities are used in the manufactures. The proposed tariff on sugar will soon increase the wholesale price of extracted honey, while the retail price in the home market is usually two-thirds the price of comb honey, and a much greater quantity can be retailed of the former. Allow your honey to remain on the hives until well ripened, and you will have no trouble to dispose of a large quantity.

Starkville, N. Y., April 20.

After such an able article as this it is unnecessary for me to add any thing; for the writer shows that he knows what he is talking about. It is well known that Mr. Elwood is one of the most extensive bee keepers of the world. His large experience, his thorough knowledge of the business, his scholarly attainments, and gentlemanly bearing, lend great weight to what he has so ably said. One such article as this is worth hundreds of articles of abuse directed at our name and honor at the instigation of a single competitor.

Here is another strong article from a bee-keeper of international reputation who feels deeply indignant over the unfair and unreasoning methods that have been taken. He prefers to use a *nom de plume*.—Ed.]

## NOTHING BUT NOISE.

### THE NEW DRAWN FOUNDATION AND ITS ENEMIES.

Adulterators? Yes. Who are adulterators? Nearly all of the great multitude of bee-keepers of the world. Who says so? A late issue of one of the newspapers. How do you name that out? By their own words; for every writer of this symposium is using, and has been using during the past, something which is just as much of an adulteration as the proposed drawn or deep-cell wall foundation which they are now crying out against. If there is any difference between a comb foundation with heavy rudiments of cells, from a thirty-second of an inch to three sixteenths of an inch high, and a comb foundation having those rudiments extended to three sixteenths of an inch on each side, thus forming the same amount of wax into short thin cells, nearly as thin as the bees themselves make, then the writers of those articles in some bee paper have failed to show it. If the words an adulteration then the worse commercial business is an adulteration, and they are situated in the same "saddle" with the Root and Ayer. In this matter, as the words of their own mouth prove—they not giving any practical argument to the contrary. Come, gentlemen, be consistent, and give us some proof in this adulteration matter, or else throw the whole foundation business overboard as a sinful thing. You say you use only enough foundation to secure combs built straight in the sections, and to start the bees in the same as quickly as possible. Is not the new deep-cell wall foundation for the same purpose? and will it not answer that purpose better? Why have you not been shouting to your customers in the past, "Second-hand chewing of wax," "shipped with tallow," "stinking hides," "old lard," and "in-contact-with-all-nastiness" wax, before, when you have been pushing the same thing on the public, for lo! these many years? You must have forgotten that all commercial wax goes through a cleansing process with water, etc., by the Dadants, the Roots, and others, and yourselves probably, that takes

out all impurities and filth (if there is any) before it is made into foundation, deep-cell-wall or otherwise.

I believe Doolittle told the truth in that bee-paper, when he said that this deep-cell-wall foundation was much nearer perfection for what it was intended than was the foundation which was accepted "with the tossing of hats" by all, with its advent; and there is not a thing, *nor has there been any thing uttered by the opposition* to shake the truth of his assertion. Many have thought that comb foundation was something sent from God (as are all good things which are appropriated by men), and if so (and who has doubts in the matter?) then this deep-cell-wall foundation stands in the same category, so far as any proof to the contrary has been given. Would it not be well for the opposers to turn and read Acts 5:34-39, inclusive, till they can give us something besides prejudice to sustain their position?

While much more fair than many of the others, I am surprised at some of the things written by Bro. Hutchinson. The desire to prejudice against the deep-cell-wall foundation is quite apparent in one of his articles. In this he is only doing what he considered very unfair in the sugar-honey controversy. Some sensitive people, while eating honey at my house, have piled up bits of wax about their plate, when eating honey, before the advent of foundation, equal to any thing that I have ever seen since, when the same persons were eating comb honey from sections which were filled with foundation; while the one who found no wax in his comb honey before foundation came, finds no wax now. There has been such a desire to prejudice against this deep-cell-wall foundation that matters have been only partly stated, all evidently having been given with a desire to create an opposition to it, and not in its favor.

Go on, friends Root and Weed; for in this abuse and desire to prejudice, instead of argument, you have no reason for complaint. If those opposed choose to fire in the air, why should you complain? Keep right on with your work. Waste no time in answering statements that are not arguments. Do not spend time and effort in trying to defend yourselves from these personal attacks. The utmost you need to do is to remind the opposition (unless something is presented different from what there has been) that your personal character or ability is *not* the "question before the house," and that your opponents, in attacking you personally, concede that they have no argument to produce.

From what I have read so far, as put forth by the opposition, I am constrained to give President Lincoln's little story, in closing: In conversing with a friend about the way his

administration was criticised and attacked, he said: "After all, it reminds me of a couple of immigrants fresh from the Emerald Isle. They were making their way westward in search of work, when, one evening, coming suddenly upon a pond of water, they were greeted with a frog chorus—a music they had never heard before. Overcome with terror they clutched their sticks and crept forward. The enemy could not be seen. At last a happy idea seized the foremost. Stepping to his companion's side he exclaimed, "And sure, Jamie, it is my opinion it is nothing but noise!" JUSTICE.

[Both of these articles came unsolicited; for we have not thought it necessary to scour the whole bee-keeping world writing letters (as the opposition has) to secure sympathizers. With the exception of the party mentioned we have not received one word of protest to the drawn foundation (and we have sent out now hundreds of samples) from our subscribers and patrons. On the contrary we have received scores of letters of encouragement and praise at the success of the new foundation.—E.D.]

#### STARTING IN BEE-KEEPING.

*Question.*—Having been persuaded by a friend to take GLEANINGS IN BEE CULTURE, through the reading of the same I have a desire to start in bee keeping. Seeing that you have a beginners' department in that paper I am led to ask you how many colonies I had better purchase to start with. I had thought of buying 50 colonies. Do you think that number would be as many as I should buy?

*Answer.*—My answer would be, that said number would be from twelve to twenty-five times as many as any beginner should buy unless he has considerable knowledge of the business before thus starting into it. The beginner should guard against going recklessly into bee-keeping by putting his last dollar into a business he knows nothing of. It is this getting crazy over a business which looks to be a good thing, but with which we are not acquainted, and investing all we have in it, expecting to make a fortune, which ruins so many. To be successful in any thing, a man must "grow up" in it by years of toil and study till he becomes master of the business, when, in nineteen cases out of twenty, he will succeed. I was brought up a farmer, and educated by my father as such, so that, were I to change my occupation at any time, it would be to that of farming, unless I could have time to study up some business more to my liking before I left bee-keeping. Pardon a little personal reminiscence, given by the help of old diaries.

In the winter of 1868-'9 I became interested in

bees by reading the first edition of "King's Bee-keeper's Text-book," which chanced to fall into my hands. Next I subscribed for one of the bee papers, read Quinby's and Langstroth's books, and in March bought two colonies of bees and the hives which I thought I should need for two years, paying \$30.00 for the whole. The year 1869 being the poorest one I have ever known, I had but one swarm from the two colonies bought, and had to feed \$5.00 worth of sugar to get the bees through the winter. In 1870 I received enough from the bees to buy all the fixtures I wished for 1871, and a little to help on my other expenses from the farm. So I kept on making the bees pay their way, as I had resolved, during the fall of 1869, that, after paying the \$35, I would lay out no more money on the bees than they brought in, believing that, if I could not make the three colonies pay which I then had, I could not three hundred.

In the fall of 1872 I found that I had an average yield of 80 pounds of comb honey from each colony which I had in the spring, which was sold so as to give me \$559 free of all expense incurred by the bees, except what time I found it necessary to devote to them.

That season I procured an extractor, and being determined to give the bees the care they needed, and knowing that the time the bees needed the most attention would come in haying and harvest time, I hired a man to take my place in the hayfield. It so happened that he commenced work on the day basswood commenced to bloom. Previously I had hived a single swarm in a hive filled with empty combs, and concluded to devote them to extracted honey. The man worked sixteen days at \$1.75 per day; and I extracted, during those sixteen days, honey enough from this colony to sell for a few cents more than enough to pay the man for his work. I state this to show that one new swarm of bees, properly worked, was equivalent to myself in the hayfield for sixteen days; yet how many, keeping from 30 to 50 colonies of bees, leave them, to go into the hay and harvest fields, and then tell us bee-keeping does not pay! You can hire a man to take your place in the field; but if you expect to become master of the bee-business, so as to make it pay, you can not hire a man to take your place in the apiary during the honey season; for, according to my opinion, it takes much more skill to be a successful honey-producer than it does to do the ordinary work on a farm. When the bees do not require any special attention, then they can be left, and the apiarist do other work, as he may have time; but the bees must not be neglected for a single day when that day will put them in condition to bring us dollars in the future, if we are to be successful bee-keepers.

In 1874 my honey was sold so as to bring me \$970, free of all expense from the bees, not

counting my time, and I now began to think of giving up the farm, but finally concluded to hold on to it one year more, to make sure that I could make bee-keeping pay as a specialty. After deducting the expenses of the bees from the sales, I found that I had the next year (1875) the amount of \$1431, and hesitated no longer, but gave up farming and embarked in the bee-business, with nothing else as a source of revenue, although since then I have had other "irons in the fire." Now, had I bought 50 to 100 colonies to start with, the expense in starting would have been not less than \$300 to \$400, which, in all probability, I should have lost in the business, for I should not have had a knowledge equal to the doing of so large a business on the start.

My advice to the questioner, and all others who think of trying bee-keeping as a business, would be, procure two or three colonies of bees; post yourself by reading and experimenting with them, as you can find time to do from the business you are already in, and thus find out for yourself which is the better for a livelihood—the business you are already in or keeping bees. If successful, after a series of years you can give up your other business if you wish to. On the contrary, if bees are a failure in your hands, then you will be but little out for having tried your hand at it.

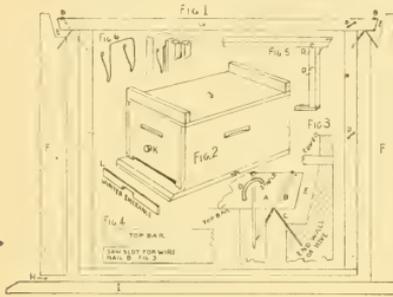

#### THE BOOMHOWER HIVE AND FRAME.

*Mr. Root:*—I want to give you a little idea of the style and construction of the hive I use. We have 300 colonies, and have used this style of hive for the last four years, and some of them longer. I have discarded all Hoffman frames. We used them two or three years, but found them too expensive and unhandy for rapid handling, crushing and killing too many bees. I have now passed my twentieth year in this business, making it my only occupation. I spent one year in A. E. Manum's apiary and queen business. I have in that time spent a small fortune in experimenting, but have at last a perfect hive at a little cost, and simple to make. I will boldly make this assertion: That I with this hive can do the work, and take up less than half the time required in any other style of hive. If you want to see something nice and handy, I will send you a complete hive by freight. I know you will laugh at the ease it can be handled with. You can't possibly crush a bee in handling the frames. A blind man with one hand can run bees in it.

You will see there is a complete bee-space all around the frames, and no possible chance

for the bees to glue them fast at any point. The frames are always free to handle; and when the follower is in, not a frame can leave its correct position in the hive. I want nothing heavier than  $\frac{3}{8}$  inch thick for top-bars. The staples are no hindrance in using the uncapping-knife, as I know we can and have extract-

ed 1800 lbs. of honey from the hive in less than three hours, with two of us, one to take them from the bees and one to run the extractor.

F. BOOMHOWER.

Gallupville, N. Y., Jan. 25.

[This is the hive and frame I promised (page 128) to show, although, as I have already pointed out, some of the principles are over 20 years old. The new end-spaced Hoffman, I think, would generally be preferred to frame as above shown; still, others may think differently.—ED.]

#### NATURAL COMBS IN WIRED FRAMES.

In perusing your March 1st issue I was somewhat surprised to find a great discovery had just been made and commented upon as something new in bee-keeping, and the great possibilities for bee-keepers to produce natural combs by having them built directly in wired frames, straight and true, without the aid of foundation. I must say that I could not refrain from a broad smile at our friend, the discoverer of this new (?) process.

To me this process of getting fine straight combs built in wired frames is quite old, as I have been practicing it successfully for more than ten years, and have had many hundred if not thousands of true and straight combs built in my apiaries.

Two or three conditions are requisite for the best results, and must be strictly observed in getting these combs built true in wired frames, and true on the wires. The frames should have a V starter or its equivalent, and the hive must stand level from side to side, and be elevated one or more inches higher at the back than front.

If brood-combs are desired, a foundation starter can be used about one inch wide, to induce the bees to build more worker comb; and if drone combs are wanted, place your wired frames with or without foundation starters, in

or near the center of a populous colony that is gathering, and well stocked with honey and brood; or wired frames placed above the brood in the second story of the hive will generally be filled with drone or store combs for extracting.

Yes, the progressive bee keeper can get fine natural combs, built without the aid of foundation, by observing the above suggestions, and compete with the closest competition, if the present methods of adulteration are not taken into account.

J. W. WINDER.

New Orleans, La.

#### CAGES FOR SENDING QUEENS LONG DISTANCES.

I am much pleased to inform you that the last two queens you sent me arrived in good order. I am glad that you have adopted my suggestion and made the cage deeper, and also ventilated one end only, and left the other snug and warm. The cage as now made is nearer perfection than ever. There are no small passages, as in the Manum, for the dead bees to close up, and the bees can now adapt themselves to the temperature through which they may be passing, by moving from one end to the other. I have now been corresponding with you for several years in regard to the construction of these cages; and while you have maintained all along that the food had much more to do with the successful conveyance of the queens than the cage, I have insisted that the construction of the cage is equally important, and I think so yet. I am not yet convinced that honey as a part of their rations conduces any thing to success, and I'll tell you why: By the mail before last I received 8 queens from you, of which 4 were dead; and in one of the cages with the live queen the honey had not been touched. The candy, if properly made, will never run and daub the bees, and it contains *all* the essentials necessary to sustain the bee to the end of its natural life, and honey can't do more. When the time arrives I intend to send you 4 queens by the same mail, put up in cages similar to your latest, but in two of them I will fill the "honey" compartment with candy, and you can carefully note the condition of those cages containing a part ration of honey and those with none.

In regard to those two queens that I received last, in one cage the queen was the only inmate alive, but she was so lively that she was amusing herself by flying around the cage. The other cage, however, made my heart jump, for it contained 33 *clean, lively* workers, and only 17 dead ones. By the same boat I received two queens from Jennie Atchley, put up in a partitioned box similar to those sent out from Italy, with one small frame of honey only for food, and about 100 escort bees. In one compartment the queen and all the bees, with the exception of a solitary worker, were dead, while the other compartment contained two live workers and the queen.

So far this season I have received 14 queens from you, of which 6 have come alive. From other dealers I have received 11, out of which number only one has come alive. How does this speak for the superiority of your style of cage? You are on the right track, and practical perfection is not far off. H. L. JONES.

Goodna, Queensland, Aus., Nov. 20.

[I can't agree with you in thinking that the honey does not conduce to success. In two other shipments sent about the same time as yours, all the honey was used, and but a part of the candy. If you tear up the capping I think you will find that the honey was used. We found, owing to the lack of room and the coating of paraffine, that the bees tunnel under the capping. At first sight the honey appears untouched.—ED.]

#### LUCERNE OR ALFALFA HONEY INJUSTLY ASSAILED; QUALITIES OF OTHER HONEYS.

Some months ago there appeared in your columns a letter from Mr E. Lipper, editor of the *Aust. B. Bulletin*, in which he referred in most disparaging terms to the quality of lucerne honey. Surely you, Mr. Editor, and the many bee-keepers of your land who have given such high opinions of the quality of alfalfa honey, can not have recognized that it was your old friend who was thus, though under another name, being abused. Neither a footnote, nor any article that I have noticed since in your paper, makes any defense of alfalfa honey.

At a recent meeting of the Hunter River Bee-keepers' Asso., Mr. Munday, the pioneer of modern bee-keeping in this district, drew attention to this particular portion of Mr. Lipper's letter, and elicited the fact that the experience of every bee-keeper present directly differed from that given by Mr. Lipper. A few years ago, when, after the great flood of 1893, there was none but young lucerne-fields, the yield was light, and the quality nearer like that described by Mr. Lipper; but now that the plants have become strong and deep-rooted, the yield is good, and the quality in color, density, flavor, and aroma, such as to suit the most fastidious taste, pleasing eye, palate, and nose.

At the last Maitland show it was an exhibit of lucerne honey that carried off first honors, and the same was the case at Singleton.

Surely Mr. Lipper has made a mistake in slandering the quality of this honey, gathered from the only source yielding much honey, near the town where he resided for many years.

Trusting you will find room for the insertion of this letter, written by instruction of the H. R. B. K. A., as an expression of the unanimous opinion of those present at that meeting, I remain, etc.,

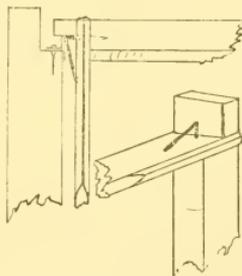

MICH. SCOBIE, Hon. Sec. H. R. B. K. A.  
West Maitland, New South Wales.

[The matter to which you refer appeared on page 570 of last year. I have again read over the paragraph, and I do not see that the char-

acter of alfalfa is assailed, for I could hardly allow that without a protest. Mr. Lipper simply says the honey is very thin—almost sweetened water—and that he has not been able to get it thicker. I simply supposed that the climate had something to do with it, for the same honey in this country is beautifully thick, and of the very finest quality. You probably have not seen what has appeared in our columns in favor of alfalfa. A couple of years ago it was extolled by quite a number (among them the writer) as the richest and finest honey in the world, and to this day I have not tasted the equal of it, although the ordinary northern clover approaches it very closely. Next, according to my notion, would come sweet clover, basswood, mountain sage, and thistle. Among southern honeys, palmetto, mangrove, and Texas horsemint stand high.—ED.]

#### END-SPACING OF FRAMES.

Your sketches of end-spacing devices are timely. End-spacing, to a large degree, does away with one of the principal objections to Hoffman frames. I have found that propolizing ends of frames makes them harder to move than the little they may stick on end-bars. I am afraid, though, that the staples will cause some annoyance to bee-keepers who, being unaccustomed to them, and being used to full-length top-bars, will, in replacing frames, get the end in line with hive, and bring down the frame with a jar on the tin rabbet. Why not bend wires like enclosed cut? You see the

lower end is left rough to go a natural distance into the end-bar, using the templet as guide to driving, as suggested in GLEANINGS.

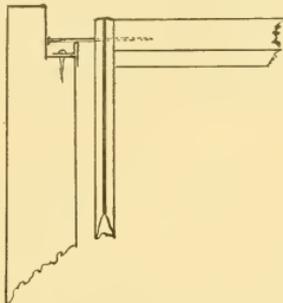

B. F. ONDERDONK.

Mountain View, N. J.

[This same idea was submitted to us, I think by F. Boomhower, of Gallupville, N. Y.; and our Mr. Calvert, before his samples came to hand, had bent some wire nails and attached them to the frames. But the more we considered it, the more we became convinced that the staple, which we have since adopted, is the better. An objection to the bent nails above shown is the difficulty of driving them into position. I can not explain it; but one will discover it when he comes to drive very many of them. Moreover, the lower projection can do very little more than prick into the wood; and this end would not be as stable for that reason as it ought to be. But the most serious objection is, the moment the frame is raised a little there is too much end play. We tried frames stapled and frames as above, and we very soon discovered that the stapled

frames would hold their position much better. For instance, in hauling over rough roads, the bent-nail spaced frame is liable to hop out of position, and then the wide ends of the Hoffman frames interlock. The stapled frames can be jarred up a quarter of an inch from the rabbet, and still be end spaced correctly. Here is another idea:]

In reading over your description of the Hoffman frame for 1897, the idea struck me, "Why

not do away with the wooden ends altogether, and replace them by nails thus?"

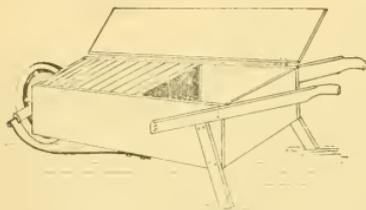

Knoxville, Tenn.

ADRIAN GETAZ.

[At first thought this seems like a very simple solution of the problem; but here actual experience is very much at variance with theory—at least it was so in our experience and in that of some others who have reported in regard to it. The worst trouble is, that the nail, even if it does not bend itself, as it does, has too small a bearing in the wood; and a 15 or 20 lb. frame in time causes the top-bars to be of uneven height.—Ed.]

#### A WHEELBARROW FOR CARRYING EXTRACTING-FRAMES.

Inclosed find a drawing of the wheelbarrow I am going to use the coming season in the apiary. It is all made of pine lumber, and is very light, using  $1\frac{1}{2}$ -inch band-saw for tire, and  $1\frac{1}{4}$ -inch spring-steel for the springs, which are 30 inches long, and fasten on to the bottom of the box with two  $\frac{1}{4}$ -inch bolts in each spring, as shown. The wheel is 17 inches in diameter,

with  $1\frac{1}{2}$ -in. rim and 14-in. hub. The box is 44 in. long,  $12\frac{1}{4}$  in. deep, and 18 in. wide, outside measure; handles 32 in. long, projecting 16 inches, and screwed on the sides of the box; legs 11 inches, projecting below the box, making the box stand level when not in use. The box can be made to suit the length of frame

used. I hang my frames in crosswise, because I have them all wired. If one wants, there can be a rabbeted piece put in crosswise, and they can be hung in lengthwise. If not wired, that would be better. I can carry 27 frames in this box; and as I use 9 frames in my hive I can take the combs from 3 uppers at a time. It seems to me that this would suit bee-keepers much better than the ordinary wheelbarrow; and it cost me only \$1.75, and I did the work, and have it all painted and ready for use.

Last year we had no honey to speak of in Southern California, but hope to get a good crop this season, as we have had an abundance of rain—about 16 in. in all—and every thing is looking very promising, and my bees are in fine condition. We are expecting to get a good flow of orange honey, if the weather is favorable the latter part of this month, before moving our bees to the hills.

M. H. DUNN.

Fullerton, Cal., March 8.

[Your wheelbarrow idea will do very nicely. The only objection is that it places a pretty heavy load on the man. Some years ago we illustrated a comb-carrying cart used by Mr. Osburn, then of Cuba, constructed somewhat on the same plan, only that it had two cart-wheels, and an axletree, a little forward of the center of the cart. This would place almost the entire load on the wheels, and of course be much easier for the man. But your wheelbarrow would have the advantage that it can be run in a narrow path, and would be a little more easy on the load if not on the man.—Ed.]

#### THE ARTESIAN WELLS OF SOUTH DAKOTA.

□ I think A. I. might have been satisfied with seeing artesian wells that threw out water 100 to 150 ft. high at the rate of 600 to 1000 gallons per minute; also one at Aberdeen, that has not been properly cased, that is washing out the town so that several houses have had to be moved to save them from being undermined.

#### A FISH-STORY: CATCHING \$1000 WORTH OF FISH A DAY FOR 16 CONSECUTIVE DAYS.

At The Dalles, Oregon, are immense salmon-canneries where they catch fish in large wheels costing \$500 each. These are turned by the water, and elevate the salmon above water, into a large box. I was told that one man owning 10 wheels that cost \$5000 had caught and sold \$16,000 worth to the cannery in 16 days.

At that place was my first sight of an immense lumber and wood flume, 20 miles long, that brought large quantities of wood and lumber from the mountains. On our way to Vancouver by steamer are many fine scenes. At one place is a waterfall of 850 feet.

#### HARNESSING UP NATURE.

□ At Bois  City, Idaho, they are "harnessing up nature," as Uncle Amos advises, by warming the business houses and depot with hot water out of deep wells. It seems the deeper the well, the hotter the water.

Well, I expected rain in Oregon, and we got

It; but when I got to California I expected honey but failed. I stopped in hotels in Marysville, Sacramento, Oakland, San Francisco, San José, Santa Margarita, Los Olivos, and San Luis Obispo, on stage route, and Los Angeles and Santa Monica and at several private houses, and at no place was honey on the table. I saw several apiaries on the stage route over the mountains between Los Olivos and Santa Barbara. I think it is time the bee-men created a home market for their honey.

If you ever wheel this way, call on me. I am not far from Mr. Cole, the garden plow man. Mr. Porter, the bee-escape man, lives at Lewistown.

M. W. MURPHEY.

Cuba, Ill., Dec. 8.

#### RETAILERS MUSSING UP HONEY.

Woodchopper's complaint in April I GLEANINGS, concerning retailers mussing honey in handling, etc., and frequent complaints of others in the same strain, caused me to think that perhaps my way of getting around that unpleasantness might be generally appreciated by honey-men, as I already know it is appreciated by a number of grocers I supply with honey.

It is merely a small cupboard, about 20 inches square, if you use the  $4\frac{1}{4}$  square, and 22 inches high, made of fancy pine, oiled and polished, with a 14x16-inch glass in front, thus showing the faces of 16 sections. I make it with a shelf in the middle; place a paper on the bottom and shelf, and set the sections on narrow strips  $\frac{1}{2}$  inch thick, which prevents all mussing from leakage from any cause. I extend the paper on the shelf down just below the top of the first row of sections underneath, so that nothing but honey meets the eye of the purchaser, and they—well, they just look, admire, and buy, but never handle and muss, as the door opens behind the counter.

Two grocers told me that it more than doubled their sales the first year, and my order-books prove it. It makes honey as clean to handle as canned goods, which is a great consideration with dealers.

W. W. CASE.

Baptisttown, Pa.

#### "NON-SWARMERS" SWARMING.

To-day at 11 o'clock I experienced the novelty of uniting two swarms of different races of bees. Swarm No. 1 was headed by a Carniolan queen from Miss Amanda Atchley, of Belleville, Texas. It settled on a limb nearly opposite a hive of H. Alley's celebrated non-swarming Adel bees. This latter hive showed a disposition to swarm some two weeks ago, when I took the precaution to clip the non-swarmers' wing, and added another story, making a three-story hive. Just as I finished sawing the limb, and was lowering it to a new hive at the foot of the tree, the non-swarming

Adels issued; but their queen failed to follow, and they began settling down with the Carniolans, seeing which I promptly added another story with full sheets of foundation, and in less than ten minutes every bee was inside.

I moved the hive to a new location; and upon examination this evening I find the beautiful grays and the golden Adels (making an elegant variegation) busily engaged in fitting up their new home. Both stories showed them intermixed, and every indication of being thoroughly united. Will they stick?

Franklin, Tex.

J. NO. C. MITCHELL.

[The fact that the two swarms united is nothing unusual; but the fact that the "non-swarmers" did come out is rather of a joke on friend Alley. However, there are exceptions to all rules, and in the case of bees there are a good many, especially when it relates to swarming.—Ed.]

#### THE ADVANTAGE OF DEEP ENTRANCES IN GETTING ALL THE SECTIONS FILLED.

In response to your request as to whether the raising of the brood-chamber from the bottom-board causes a more even distribution of the surplus in the sections above, I will say that I think it does. I use a  $\frac{3}{4}$ -inch frame between brood chamber and bottom-strips on bottom-board, making an inch clear of bottom-board for wintering. The dead bees then drop down out of the way, and do not mold the combs. Last spring I left 10 hives with these deep entrances, as they were large colonies, but I never thought it was the cause of every section in the super being well filled, as the case proved to be. Flow was only moderate.

J. C. WALLENMEYER.

Evansville, Ind., Jan. 27.

#### DRAWN FOUNDATION AND ITS ENEMIES.

It is really amusing to see so many alarmists brought in line by a little editorial fire, to fight an imaginary foe in the shape of drawn foundation. With "Progression" inscribed on their banner they would deal the death-blow to deep cell walls, the acme of genius and skill, condemned and untried. But all opinions found prior to a fair test of the comb is no proof of its failure. Bring it to the front, regardless of the unkind thrusts at your reputation; for it is said, "Woe unto him of whom all men speak well."

A. B. BAIRD.

Belle Vernon, Pa.

#### BLACKS BETTER FOR WINTERING THAN ITALIANS.

My black or common bees have come out uncommonly strong in numbers; but half my Italians have died in the hives with plenty of honey. I set my hives in outside cases large enough so that I packed three inches of leaves around the hives and on top. Still the bees are dead. I like black bees best.

Hinsdale, Mass.

C. G. ASCHA.

SPECIAL attention is called to the articles by P. H. Elwood and Justice, elsewhere in this issue.

THE flood of orders for supplies from all quarters seems to indicate that the prospects for the season are unusually good.

FOR several issues back we have been giving eight extra pages to make room for the extra advertising, and it looks as if we would have to continue giving this extra space for a while.

THE copy for the Fred Anderson serial came to hand just too late to get in this issue; we regret, therefore, that we have to leave it out this time. Copy is in hand for the rest of the story, and there will be no skip from this time on. It is drawing to a close, and the "mystery of Crystal Mountain" will soon be made clear.

THERE is some talk of a change of name for the United States Bee-keepers' Union, to something else, to avoid confusion with the other organization, the National Bee-keepers' Union. If there are to be two Unions, then a change should be made. Personally I like the name United States Bee-keepers' Association. At the next annual meeting in Buffalo this thing will be discussed.

WE put into winter quarters last fall 241 colonies, most of them in fair condition; but there were a few weak ones. We find at this date, April 24, 230 colonies; 5 of the 11 seem to have died during winter from the extreme cold, the other 6 having spring-dwindled during the last two or three weeks. Some of the weather of late has been unfavorable. There have been a good many raw days, some of the nights going down to freezing and below. The consequence is, we have had a little touch of spring dwindling.

"SUCCESSFUL BEE-KEEPING" is the title of a booklet on bees, by W. Z. Hutchinson, published by the W. T. Falconer Mfg. Co., Jamestown, N. Y. It takes up the subject of learning the business, selecting the locality, the kind of bees to get, transferring bees, introducing queens, producing comb honey, etc. Several years ago we realized the necessity of getting out a booklet on the management of bees, because we noticed that there were many who, even if they could afford to buy the more complete text-books, would not take the time to read them, and we therefore put this matter, not in a booklet, but in extra pages of our catalog. It is not possible to estimate the amount

of letter-writing that this has saved. Mr. A will write in and ask how to transfer bees. To refer him to the text-books at the price of \$1.00 or \$1.25 is apt to have a wrong effect; but giving him the information needed, boiled down in a nutshell, at no cost to him, very often gives him an appetite for more knowledge, and this means an order for a text-book. The fact that W. Z. Hutchinson's name appears as author of the booklet mentioned is a guarantee that the instruction is boiled down and orthodox. We do not know whether any price is charged or not. Inquiry can be made of the publishers, as above.

#### HOW TO MAKE END-SPACING FRAMES OUT OF OLD-STYLE HOFFMAN FRAMES.

NEXT week we shall cut off the top-bars and put on the end-spacing staples to all the frames in use in our apiary. The projections of the top-bar are  $\frac{3}{8}$  inch, and we shall therefore have to cut off about  $\frac{1}{4}$  of an inch from each end. To do this most expeditiously we have constructed a tray without bottom, 4 inches deep. The length of this tray, *inside* dimension, is  $\frac{1}{8}$  inch longer than the *outside* dimensions of the Langstroth Hoffman frame. The width should be the same as that of the hive used, and in our case that of an eight frame hive. This frame is mounted on legs of  $\frac{3}{8}$ -inch stuff 2 feet long, the legs being braced. We now have a topless table two feet high. The length of the projection of the top bar to end-spacing Hoffman frames is  $\frac{1}{2}$  inch; therefore the thickness of the ends of the tray should be a scant  $\frac{1}{2}$  inch.

WE are now ready to cut off the top bars of all the old-style Hoffman frames in the apiary. We cut the topless table near the hive; shake the bees off the frame; in front of the entrance, and slip them one by one into the tray or topless table. If the table has been made right, the frames will just slip between the ends of the tray, and the top-bar projections will stick over  $\frac{1}{4}$  inch. A saw now cuts them off just even with the end of the tray at both ends. After the staples are put on according to the directions previously given on page 95, the frames are ready to be put back into the hive. The other hives are then treated in a like manner. Usually it will be found advantageous to have an assistant, because two can work to better advantage.

#### MORE EXPERIMENTS WITH DRAWN FOUNDATION; HOW BEES MAKE COMB.

ACCORDING as the weather has permitted during this spring, we have been putting into the hives at different times samples of the drawn foundation, together with a sample of ordinary foundation in the same comb, side by side. As it was cool weather, and no honey was coming in, the foundation of course in every case was either untouched or gnawed into, while the

*drawn* (or deep cell) article was as often accepted. A very noticeable fact is that, when the new product is put into the hive, it is transparent. After the bees have had it for 24 hours the new transparent cell walls seem to assume the color of natural comb or appearance of ground glass. The bees began immediately, it seems, to thin down the walls to their natural thickness, and in doing so they seem to take off thin scales of wax, and add them on to the ring of wax at the top of the cells. While the new product is accepted at once, it seems to be all worked over with the exception of the base, which is flat, and apparently untouched, so far as thickness is concerned.

From experiments Mr. Weed has conducted, it would appear, although we may be mistaken, that the bees do not generally, at least, straddle the cells of common foundation with their mandibles, and continue this process of pinching until the cell is elongated, but, on the contrary, take off little minute films of wax at the point where it is not needed, and add it to the thickened ring at the top of the cell. It would appear that, in natural comb building the comb itself is made up of small particles pressed and kneaded together into a perfect comb; so, then, when we give them the new drawn foundation they reduce the thickness of the wall by taking off small particles and adding them to the top of the cells. This process of scooping off the minute film, and adding it to another point, gives the cell walls a sort of scraped or scoured ground glass appearance to the naked eye, taking away that delicate transparency that is so noticeably characteristic of the new Weed drawn foundation. If the bees build their comb in this way, as we have reason to believe they do, then we can account for the flaky condition that Mr. Hutchinson describes; and it is possible that by "flaky" he meant—well, easily crushable comb, not brittle as the term would seem to indicate. If this is a desirable characteristic it will be just as marked in the new drawn foundation as in the ordinary product.

In the experiments Mr. Weed has been conducting, it seems to be apparent that bees take the new drawn foundation quicker when the cell walls are somewhat defective or broken than when they are perfect, because they seem to regard the broken article as their own product that has been damaged, and must, of course, be repaired at once.

We are now sending out hundreds of samples of the new product; and I hope others will experiment. If the new thing can not stand the examination of impartial critics then it is not fit to stand. I say "impartial," because I am fully aware of the fact that there are those who show by their very writings that they have no disposition to give the new article a fair test. Fair criticism we are prepared to meet, but don't care to waste time on anything else.

*apis dorsata*; A SCHEME TO GET THESE BEES IMPORTED INTO AMERICA AT A SLIGHT COST.

We have just had a very pleasant visit from Mr. W. E. Rambo, at present located at Hiram, O., but who has been until recently a missionary at Damoh, India. He is now reemigrating in this country, but expects to go back to his mission field this fall to take charge of a boys' orphanage and industrial school. While here he is posting himself up on various industries, with the view of introducing them into his new work among the boys. He has been a subscriber to GLEANINGS for a year or so, and in the mean time has been reading and studying so that he may be competent to teach bee-keeping.

When I learned that he was a missionary from India, a subscriber to GLEANINGS, and an enthusiastic bee-keeper, the suggestion of Mr. W. A. Stilson, of the *Nebraska Bee-keeper*, flashed through my mind. You will remember how he showed up the folly of sending a man over to India, at an enormous expense on the part of the general government, to secure *Apis dorsata*. He urged that if the bees were really desirable, and could be domesticated, they should be obtained through missionaries already in the field, at a very slight cost.

After talking with Mr. Rambo in regard to the faunistic in India (see general) climate the characteristics of the people, of tigers (especially the man-eating kind), we began to discuss the feasibility of importing *Apis dorsata* and *Apis Indica* from that country to U. S. He described to me a small bee that seemed to be very common in his vicinity, and which I feel very sure is *Apis Indica*. They build a single comb under the limb of a tree and their nests are very common. He has also seen what he believes to have been the *Apis dorsata*, and the nests themselves.

The upshot of the whole matter was that we are to equip him with hives material, etc., necessary to test *Apis dorsata* right in its own climate—in other words, determine whether they can be domesticated *at home*. He was, however, of the opinion that neither race I have mentioned could be confined to a hive; but if they could he was sure that he and his native helpers, who are quite familiar with the bees, could do so just as well as and far more cheaply than Uncle Sam by sending a man over.

When Mr. Rambo leaves this country in September we expect, of course, to send along with the general shipment some mailing-cages as well as some small boxes for express shipment. Arrangements can be made to have the bees shipped to some bee-keeper in England, where they can have a cleansing flight, and, after a few days, be forwarded to the United States.

There, now, don't you see we can get *dorsata*, if it can be kept in hives at home, at an infinitesimal cost.

tesimal part of the cost that it takes to send some one after them?

If they can not be domesticated in India they certainly could not be in this country; so we would determine this point first before we went to further expense. But even if they could not be domesticated they might be of advantage in the way of the fertilization of certain flora by letting them run wild in California and the South.

Now, I suggest that bee-keepers, instead of trying to encourage a scheme that would cost the general government thousands of dollars, wait to see what the A. I. Root Co. can do through Mr. Rambo. This would cost the general bee-keeping world practically nothing.

We expect to have another interview with Mr. Rambo before he leaves for his mission field, and all details will be further discussed.

#### QUEENS EXCLUDED FROM THE MAILS.

A GENTLEMAN conversant with mail matters informed E. T. Abbott, ex-president of the N. A. B. K. A., that the government was "talking of excluding queens from the mails." This would indeed be a calamity to the bee-keepers of the United States. The sending of queens by mail has grown to be a large and important industry. Anywhere from five to ten thousand dollars' worth of queens are sold in a single season in this country alone. Great good results in the interchange of stock, and without this interchange there would very soon be inbreeding.

Our older readers will remember that there was a time when queens were debarred from the mails, simply because one ignoramus of a bee-keeper attempted to send a queen and some bees in a flimsy *paper box*. Of course, the box broke and let the angry bees out into one of the important offices of the service. The result was that Uncle Sam shut down on sending any more queens through the mails, and we all had to send queens by express at a charge of from 15 cts. to \$1.00. These charges, for the time being, killed the industry. I wonder if another ignoramus has tried sending bees or queens in another paper box, or doing something else equally foolish. It would be interesting to know why the government should be talking at this time about "excluding queens from the mails." Bee-keepers have enjoyed the privilege for the last 15 years, and we were not aware that there had been any trouble since the paper-box incident.

It was Prof. A. J. Cook who made a special trip to Washington to get the queens readmitted to the mails, and he was successful; but the condition was made that there should be two sheets of wire cloth over the opening to the cage. But in later years bee-keepers have, instead of two sheets, used one, and a thin strip of board over the wire. This con-

forms to the *spirit* of the law—in fact, is better than the two pieces of wire cloth.

#### WORK FOR THE NEW UNION.

The United States Bee-keepers' Union, recently organized, has been advised of this matter; and as a member of the Advisory Board I feel sure it will take energetic and prompt action. But in order to accomplish much in this or any other direction there must be more means and more funds at the disposal of the General Manager, Mr. Secor. Under the circumstances, the new organization has made a good start; but it needs something more than a good beginning to do the work that it has laid out for itself. Bee keepers everywhere who are interested in seeing that queens are not shut out from the mails, in fighting dishonest commission men, in coping with the adulteration evil—in fact, in any and every thing that needs intelligent and organized effort, should send in their names, accompanied by \$1.00, at once to the General Manager, Eugene Secor, Forest City, Ia., or to the Secretary, Dr. A. B. Mason, Station B, Toledo, O. If more convenient, the money may be sent to Mr. G. W. York, 118 Michigan St., Chicago, or to this office, and we will see that the money is duly forwarded, and the persons enrolled as members. Remember, the amount is \$1.00. This entitles you to all the privileges of the organization, and allows you to have a voice in certain matters at the annual meeting, whether present or not.

#### HOW HISTORY REPEATS ITSELF.

THE little opposition that has been stirred up against the new drawn foundation is not so unlike the opposition that was urged against railroads in China, where, after using one a while, they tore the rails up, as the cars "disturbed" the repose of their ancestors. (The new drawn foundation seems to have disturbed the "repose" of a few bee-keepers). When railroads were first suggested in this country, so great a man as Daniel Webster "proved" in Congress that a railroad train could never go up grade, could not be stopped within twenty miles on a level, and never on a down grade; that it was not safe, and yet he lived to see them stopped in their own length at any point. The English bridgebuilder, who built the great Victoria bridge over the St. Lawrence River, declared that the proposed suspension bridge at Niagara would never hold its own weight up, that it was not safe, and "proved" it—by riding over it in a car while on his way to dedicate his own bridge further on. In these latter days a few have tried to make out that the new product is going to ruin the bee-keeping industry, and, according to their opinion, they have "proved" it too. As prophets they can look backward better than forward. But railroads and suspension bridges have come to stay, and so has the new drawn foundation.

I think I told you the population of Jerome was about 2000. Of this number about 600 are at work in the mines. Wages average about \$3.75 a day. Now figure this up for seven days in a week and you will see how much hard cash is paid to workmen in that one mine every week; and I suppose it is true that something like \$15,000 a week is what the company pays its men. But, hold on, friends. They not only work week days and Sundays, but they work day and night. There is no stopping at all of the ponderous machinery. If I am correct, there are extra engines and dynamos and other machines, so that one can be hitched on while the other is being overhauled and repaired. When the machines wear out they get new ones; and when the men wear out they get new ones. You may think the wages pretty high; but please remember that board, even by the week, is about a dollar a day; and if you rent a decent house to live in, your rent is a dollar a day, and other things in proportion. Wood is \$7.00 a cord. They do not draw it in wagons, as we do, but it is carried on the backs of patient and faithful burros. These burros need no graded road, such as a wagon must have. They toil patiently up and down a foot-path or trail sometimes almost too rough and narrow for one to go on foot. I was greatly interested in the burros. The man who furnishes wood comes into town with perhaps half a dozen. He talks to them as he would talk to a well-trained dog, and they are wonderfully obedient to his voice. Their load is so great that it is sometimes a difficult matter for them to keep their balance. A sort of rack made of wood and ropes holds the load of wood—not so much on their backs, but each side of their backs being about equally balanced. They seem nervously afraid of running against anybody or against each other; in fact, it makes me think of a rider on a wheel carrying a considerable burden. If you look at the feet of the burro and the size of his slender legs, it seems almost incredible that he can carry such loads; and, in fact, they often do jostle over and go rolling down the mountain. In that case it is no great financial loss if the burro is killed, for they cost only about five or ten dollars. When they come into town each seems very anxious to have his load removed. The driver is always careful to take the wood first from one side and then the other, so as not to throw the little animal out of balance. When he is relieved of his burden he seems very thankful; and while his master is unloading his comrades, he takes the opportunity of looking about to see what he can pick up in the way of provender. I asked one of the clerks at a grocery what burros fed on. He replied:

"Oh! any sort of rubbish they can pick up. In fact, they eat almost anything. Some folks say the burros eat tin cans when they can not do any better. This I can not prove, but I do know they eat all sorts of waste paper; and when a burro can get hold of the outside casing of smoked hams then he has a picnic indeed. Why! they are regular scavengers. They pick up almost every thing that is thrown out of the front door or the back door, all over town."<sup>28</sup>

<sup>28</sup>Mrs. Jordan told me she saw a burro one day that must have got strayed away from his comrades. He came into town alone, and marched up to a

I had quite a curiosity to know more about the source of the water-works that supplied the town. In the afternoon, when my good friend Mr. Jordan was obliged to resume his work, I secured the services of Master Harold J. roan. He is just about the age of Huber, and, like Huber, is greatly interested in any thing about electricity. I told him some things he wanted to know, and he told me a good deal that I wanted to know. Among other things, he said if I did not mind the walk he would go with me to the spring that feeds the flume that pours its contents into the great water-tank, 500 feet above the town. First we took a burro-path up over the mountains. On the way we passed under an apparatus that strongly attracted my attention. It is what they call a "bucket-line." It was put up ten years ago, before the railroad was built. This bucket-line is an arrangement of a stationary cable and a movable cable elevated on posts or poles, so as to run a bucket along the wire for a distance of nine miles. I should say, rather, a string of buckets, for the buckets are perhaps 100 feet apart. On one side they go to the town of Jerome loaded, and on the other side they go back empty. Of course, a steam engine works the machinery. Harold told me it took the buckets from morning till night to make the trip; for one of the boys wrote something on a piece of paper and put it into a bucket in the morning, and it did not reach Jerome until night. This bucket-line brought in fuel, limestone from a distant quarry, and supplies of other kinds that might be needed. Of course, such an apparatus could run from cliff to cliff, over and through tree-tops, and across yawning chasms where even a burro could not make his way.

Now we went up hill and down hill in going to that spring; but when we found it, it was off in a little valley or canyon where a little stream came down between the hills. Said I:

"Why, Harold, this spring can not be higher up than that great tank away up above where you live?"

"Why, it looks so, Mr. Root; but if it were not higher, how in the world would the water run? and it does run all the way, and seems to be down hill too, for we boys have followed it away around the mountain. It is a good way farther than the way we came, but it is surely down hill all the way."

Here, again was another illustration of that queer feature of these mountainous regions.

The United Verde & Pacific Railroad comes into Jerome away up above the town. If you want to see the railroad station you have to look away up. This railway is proud of the distinction of being the crookedest road on the face of the earth—at least, folks say so. Instead of following watercourses through the valleys it runs a good deal of the way along the crests of the mountains; and of course it has to do a great deal of twisting and turning to keep any sort of level. I suppose one object in bringing it in at such an elevation above the highest point of the smeltingworks is that the freight may be all dropped down an incline to such a point in the mines as it may be most needed. In loading the cars with the copper and gold, these metal ingots are simply run up on a powerful elevator.

By the way, there can not anybody steal gold from this mine—not even the workmen. Every

woodpile and looked around in a pleading sort of way to have somebody unload him; and then he went to another woodpile, and so on all around the neighborhood. Nobody could unload him, because nobody had a right to do so, and so the poor fellow was in trouble indeed.

dollar's worth of gold is securely locked up in, say, a hundred dollars' worth of copper, and it would take an expert burglar, I tell you, to break the lock that holds the gold combined with the copper. So these great bricks are loaded on to freight-cars, and run clear across the United States, with as much safety as if they were blocks of paving-stones, and yet they may contain millions of gold. In fact, it has been estimated that the Jerome mine has produced as high as eight millions of dollars' worth of gold in a single year.

#### ELECTRICITY VERSUS MULE POWER IN MINING.

The Jerome mines are said to be the first in the world to pull out their ores by substituting an electric motor in place of the time-honored mule. With ordinary mining, a mule or other animal pulls a single car; but the electric motor will pull a train of a dozen cars or more, all laden with ore. It was my good fortune to stand at the mouth of one of the tunnels when the motor came out with its string of ore. Said motor is about the size and shape of a good-sized cooking-stove. Imagine a large sized cooking-stove mounted on wheels, with the engineer sitting on the stove-hearth, and you have it. He sits on the stove hearth, or a low down seat, because his head would be hitting the roof of the mine were it otherwise. Then he does his switching and backing up and going ahead, etc., by simply "pressing" the proper "button." I was kindly invited to take a seat on the motor, and ride around the yard in the open air while he pushed certain cars here and there as the workmen wanted them for convenience in building up the piles of wood and ore for roasting, as I have described.

I was very anxious to accompany the motor away back under ground into the mountain; but my companion had told me that nobody was allowed to view the mineral wealth the company had discovered in their underground tunneling. Not even the bosses and proprietors of the mine were permitted to view the company's wealth unless they were specially employed in the mine, and the workmen were not communicative, for reasons best known to themselves.

Now, lest some of you may think it worth your while to take a trip to the Jerome gold-mines to get a job, let me tell you there are men standing around all the while, waiting for a chance to work. Mr. Jordan told me of a man who walked over that crooked railway all the way from Prescott to Jerome, then waited for a chance to get a job, without anything to eat until some time in the middle of the night, when a man was found lacking. Then he worked several hours without any sleep or food, so as to secure a place. The man who is not on hand to take his place when the whistle blows loses his place, and somebody else steps into his shoes. If he makes an arrangement to be absent, or gives some good reason why he can not be at his post, I presume he might hold his job; but the man who is away, with no explanation, is out. I wonder what the friends in our establishment would say if we should substitute a similar rule.

A competent physician is employed by the year, and a small per cent of each man's wages is held back as a fund to pay the doctor's bill; so that the man who is sick does not have to stand the expense of medical care. I am not sure but this fund, or a similar one, supports the man's family while he is sick, or in case of accident and loss of life. Each man as he is employed is obliged to submit to this small assessment as required.

I was obliged to take my departure from Je-

rome before daylight. This I greatly regretted, because I missed a view of the grand scenery. There was just a glimpse of dawn as we started; and after we were out four or five miles I could see tolerably. The San Francisco Mountains loomed up in glorious majesty at almost every point around Jerome. In fact, we had them constantly in view when we were making that trip between Camp Verde and Jerome. The two peaks are just a little north of Flagstaff, right on the road to that wonderful Grand Canyon. I do not remember now their height; but it is great enough so they are constantly white with snow. A little further west, and the celebrated peak "Bill Williams" looms proudly up in the distance.

Before leaving the locality I want to give you a little bit of illustration in regard to that crooked railroad. In railroadng all over the United States we often see a "horseshoe" feature as it is called. In order to avoid the expense of a bridge across a valley, railroad men often run around, as it were, so that the track, after making quite a horseshoe loop, comes around near to the place of starting. Now, the Jerome railroad not only makes some wonderful horseshoes, but it has a horseshoe within a horseshoe. In the figure below I have not tried to draw a man's face.

First we have the large curve; then, in order to get in and out around the mountain, we have the short curves back and forth, so the passenger, if he keeps his eyes open, and fixes them on some point on the mountain, say at A, he will be able to see this point again at B, then after a while at C, then again at D, and finally at E, where he will be only a few rods from where he left A perhaps an hour before, only a little lower down, and this sort of thing is being enacted again and again on that United Verde Railway.

I was exceedingly fortunate in having for my traveling companion my good friend F. E. Jordan, as he had business in Prescott. He told me there is one place just out of Jerome where the railroad has 14 miles of track in order to accomplish a distance of only  $5\frac{1}{2}$  miles—nearly three miles of crookedness to get ahead one straight mile. The railroad is about 2500 feet, or nearly half a mile, higher than the Verde River, which seems like a slender thread of silver all along the valley.

About 40 tons of copper are sent off by this crooked railway every day in the year. At the moderate price of 10 cts. per lb., the copper alone would be worth \$8000 a day; and there is a sort of understanding among the workmen that the gold in these ingots is worth about twice as much as the copper.

---

## OUR HOMES.

---

The cares of this world, and the deceitfulness of riches, and the lusts of other things entering in, choke the word, and it becometh unfruitful.—MARK 4:19.

The principal thought I have in mind in the above words, spoken by our Savior, is that part about the deceitfulness of riches. Probably

nine-tenths of those whose eyes rest upon this printed page firmly believe that greater riches would make them happier; and I fear that a good many, at least, think that worldly prosperity would make them better Christians. In my recent travels in Arizona I met with people almost continually who are more or less interested in gold-mining. It is the absorbing topic of the day. Several times I questioned bee-keepers, and I found to my surprise that almost every one of them had at different times had at least a taste of the gold-mining mania. Now, there are devoted Christians in Arizona; in fact, there are some of the most beautiful self-sacrificing Christian characters away out on the deserts that I ever met in my life. Some of them were interested in gold-mining. Yes, I know some good and faithful souls who have prayed that God would bless their efforts in locating a paying mine, or in so managing a mine already started that the expense would not exceed the value of the product. You may perhaps be aware that I was then, and am now, rather prejudiced against the gold-mining business. I was several times assured that it might be, and in fact should be, just as honorable as growing crops, selling goods, or any thing else. I replied that it had bad associations connected with it. Christian people usually object to card playing because cards are the gambler's tools, and most people would prefer to have them out of sight if they thought the miner was likely to come. Well, in a like manner it seems to me that those who are affected with the craze for mining gold would hesitate a little to talk about it among Christian people. Now, please do not misunderstand me. Most of the men engaged in the mining business are a hard hearted and ungodly class. Let me illustrate:

One evening, when we were discussing the matter, I said something like this:

"Dear friends, when a man makes a lucky hit, and finds a good-sized nugget of gold, does he not usually thank God for this gift that has for ages been stored away for him, hidden in the earth, as it were?"

My friends looked at one another and smiled; and they finally admitted, each and all, that they never heard of a case of thanking God because one had made a lucky find.

"But when the proprietors of these mines 'strike it rich,' as they say, do they not, at least *sometimes*, give thanks to God that they are enabled to set a large party of men at work, paying them promptly every Saturday night, putting in nice and expensive machinery, etc.?"

Again my friends shook their heads, and smiled. Nobody had ever heard of any thing of the sort\*. In the first place, all the successful mines, so far as I know or could learn about, are worked not only nights, but Sundays also. Several times this course was defended, and some of the friends assured me that, if I were right in the business, I would do as the rest do.

"Why, look here, Mr. Root. Where they have tried paying their men every Saturday night, and letting them have their Sundays without work, they all get on a big drunk. Sometimes there is a big fight along with it, and so the men entirely unfit themselves for business on Monday morning. The miners are

mostly of a class that can be kept from drinking and fighting only by keeping them busy. If they get drunk, and can not be on hand when the whistle blows, they lose their jobs; and this is the only thing that will keep them sober."

"But," said I, "have not the owners of the mines tried Sunday-schools and churches?"

"Not so far as we know. They have excellent reading-rooms. You yourself have seen some of them. They have fine schools and expensive teachers; but the proprietors of the mines do not seem to recognize the importance or need of churches."<sup>1</sup>

The miners are not, as a rule, paid every Saturday night, as we pay our helpers. I believe they are paid about once a month or at longer periods. One reason why they make their pay-days as far apart as possible is because, when the men get their money, the bosses are absolutely *obliged* to give them a day or two to get over the effects of payday. Well, it is not only gamblers who keep track of these paydays, and are promptly on hand around the mines at such times, but I am told that lost women come from distant cities, even as far off as Los Angeles, that they may, while the poor miners are under the influence of drink, contest for their share of the spoils instead of letting the gamblers get all of it. Fights are common, and but few arrests are made. If a man is on hand when his time comes to go to work, that is about all that is required of him. At one place where I visited, a drunken man fell into an abandoned shaft. Some of the men were talking about it, and when I asked if any attempt had been made to recover his body, the reply came:

"To be sure, not. What do we want of his body? He was given to drink so badly that he was no good before, and we can not bury him any cheaper than where he is now. Why should we bother about him?"

If I am correct, the matter was dropped then and there. There was not a coroner within forty miles or more, and nobody thought it worth while to "bother" about it. Now to our text:

I told you I knew good devoted Christian men who were praying that God would bless their efforts to locate a profitable gold mine. If God should hear that prayer, would it increase the faith of the one who prays? and would he be likely to make a good use of the money that comes? I am afraid, dear friends, that past experience shows that *money* does not make better Christians. I mentioned not long ago that our good pastor said he had never known a man brought to Christ or nearer Christ by prosperity, but many and many a one by adversity and affliction.

\*On page 130, Feb. 15, I spoke of the Rev. Mr. Healy, and his appointments for preaching in various places. One of these places is in Jerome. There is a Baptist church there, as I have explained, but it is at present without a minister. Mr. Healy gets around once in two weeks, if I am correct, and preaches in the evening. I spoke of the fact that his people find it difficult to raise even a small portion of his salary. Well, if I mistake not he said the church at Jerome in the vicinity of that great mine, with its untold millions, finds more difficulty in raising the small sum of money they pay him than even the country places away out in the arid plains. Now, may be I have not got the facts in the case exactly right; but I think I am not far out of the way. And this little incident, it seems to me, points out to us all a tremendous moral. It is not because of lack of money that our missionaries are going without their pay, and our teachers in foreign lands are being called home by the scores. It certainly is not because of the *hard times* so much as it is because of the *hardness of people's hearts*. There is money enough to build railroads clear around

\*One of the men said he had heard that the owner of one of the richest mines in Arizona was in the habit of spending a *million of dollars a year* at Monte Carlo, that celebrated gambling-ground where all the great gamblers of the world are wont to meet; and our proof-reader informs me that a writer at that place says the number of suicides there last year was 800, which is about a fair yearly average.

Toward twenty years ago I was quite well acquainted with a bee-keeper who seemed to be a very devoted man. He had some trouble with another man in regard to the sale of some bees. The matter was left to me. Both parties were professing Christians, and we soon had the matter pleasantly adjusted. It was years afterward that I met my bee-keeping friend. It was at a convention in a large city. I was surprised that he did not seem very cordial, and only incidentally referred to our former acquaintance and the service I once did him. I did not exactly understand it. A mutual friend explained. Mr. — had got out of the bee business, and gone into something else. He was prospered, and became quite well off. With the prosperity his Christianity slowly faded away, and he excused himself from attending an evening session of the convention by saying that he and a friend of his wanted to attend a place of questionable amusement. As he took his cigar out of his mouth and looked over toward me with a smile it brought a sad feeling to my heart. I said to myself, "Is it really possible that this is the man who wrote me those kind letters, and expressed in them such devotion to our Lord and Savior? and was it prosperity alone that has changed him from what he was then to what he is now?"

Dear friends, this is a sad thing to confess. Each and every one of us declares in our own heart that, if God would only try us, he would find that *we* are an exception. While I write I have in mind some plans of my own that have not turned out as I expected. I have been praying over them, and was *almost* rejoicing in the thought that God had answered my prayer. It turned out, however, otherwise, and I have been for several days feeling a good deal disappointed, and I asked myself the question, "Had God granted my prayer would it have brought me nearer to him?" I am afraid, to tell the truth, it would not. I know that prosperity—at least getting money easily—is not conducive to my best spiritual development. Some of you may think it a little strange that I, who have been greatly prospered, should write in this way. It is true, God has answered many of my prayers that might be construed in the line of worldly prosperity; but no prayer has been answered that did not require faithful and earnest hard work to bring about its fulfillment. I have tried to avoid anything that might look like show or display in the way of riches; and could you visit our own humble home I am sure none of you would say that Mrs. Root and myself have any thing about us that exhibits more display of wealth than you meet among quite ordinary people. I am *afraid* of what the world calls riches; and I pray that God may keep me from its "deceit," and, in the language of our text, from "the lusts of other things entering in" to "choke the word." Just a word more about the gold-mining business:

I confess I do not really know why it should be so much in the hands of sharpers. I do believe a man might be a consistent Christian, and manage a gold-mine. Let me give you a

the world, and enough to build hotels (that cost a million or more); and these things may be all right in their places; but there is certainly not any need in this world of ours that there should be starving bodies, and (sadder *still*) that millions of people should be starving for the bread of life. In speaking of Mr. Healy I am reminded of a postal card that came to me some time ago. Here it is: □

—Bro. Root:—in your sermon on p. 130 you state that Bro. Healy is a "young Irishman, or at least he came from Ireland." This is a mistake; he was born in Illinois, of Irish parents; was converted under the M. E. Church South, in Mississippi.  
L. E. BELL.

glimpse, however, of one little transaction in a quiet rural neighborhood in Arizona:

A stranger came into a little town and cautiously approached the bank. He told the cashier that he had some gold that he wanted to leave with him for safe keeping. The cashier handled the chunk with some curiosity, and asked him how he came by it. He said he got it out of a mine of his own, something like 80 miles off among the mountains. The man seemed to be very simple and uneducated. The cashier showed the gold to a neighboring business man, and they both asked the man more about his "find" away out in the wilderness. Before many months had elapsed, the cashier of the bank and this business man had bought an interest in this mine, raking and scraping and borrowing all the means they could get hold of. The owner of the mine, in order to have every thing fair and honest, permitted them to take entire charge of the works and run them for a week. The output of clean gold was, if I remember, several hundred dollars per day, and the ore seemed to be getting richer and richer as the miners went further. As soon as this simple, uneducated countryman, who could *neither read nor write*, got possession of the notes and securities, the yield of the mine suddenly dropped to thirty or forty dollars a day instead of three hundred or four hundred dollars as before. In spite of any thing they could do, the new owners could not make it yield any more. An experienced expert was finally called in. He made a careful analysis of the ore, and reported that the ore never did and probably never would furnish gold enough to pay the workmen. An expensive lawsuit followed, which revealed the fact that the owner of the mine had "salted" it during the week its purchasers had it on trial. Of course, he was standing around to instruct the new owners how to manage the different apartments; and while doing this he had smuggled several hundred dollars' worth of gold into the amalgamating works each day. He invested something in doing this; but his notes and securities amounted to many thousands. Of course, this was a state-prison offense; and although the evidence seemed complete, the man in some way eluded justice. I believe the purchasers recovered a part of what they lost. In undertaking to dispose of the expensive machinery they had invested in they were swindled and cheated *again*, until it seemed as if the very spirit of the prince of darkness himself had got a lodging-place in the heart of every man who bought or sold, or had any thing to do with the matter of mining and working gold.

As I have said before, I do not really know why this should be; but this is true: There is danger lurking about any spot where gold is handled in considerable quantities. The papers are continually warning people—especially people who live in the country—against keeping money in their homes. Some time ago a man got an idea that our banks and government were going to the dogs. He got all his possessions into gold, and then started to carry his gold home, so as to have it *safe*. He was warned repeatedly that he would be robbed, and perhaps murdered, if he undertook to carry out his plan. After he had passed through several escapes, and had come near losing his life, he carried his treasured coins back to the bank, and concluded that he did not want any more of that sort of experience.;

There is a fragment of an old hymn that just now comes into my mind. It may seem to you, my readers, a sudden break in my talk, and a very abrupt way of cutting away from my subject; but yet I am going to give you a verse

right here. It has given comfort and joy and peace to many a poor soul—poor, perhaps, in this world's goods, but rich in treasures that neither perish nor pass away. Here it is:

Know, then, soul, thy full salvation;  
Rise over sin and grief and care;  
Joy to find in every station  
Something still to do or bear.

One thing that has endeared this verse of this old hymn to my heart is that about rejoicing because that, no matter where we are nor what our station, whether rich or poor, we may every day find something to "bear." And if we bear it for Christ's sake we are rich indeed.

CLEARING OFF THE BEDS WHEN A CROP IS NEARLY MATURE.

There are a thousand things that need wisdom and experience in high-pressure gardening; and with a dozen boys to do the work, a smart man can be kept just as busy as he can be, directing the boys to work to the best advantage. No matter how good his boys are (we think we have some in Medina as good as there are anywhere), they want their work laid out and carefully planned. A good many times the boss wants somebody with rare wisdom to plan and direct *him* in turn. Just one illustration:

Our plant-beds are now all made up of very rich ground. The manure has cost so much money, to say nothing of bone dust, ashes, etc., that we can not afford to have a bed stand idle for even one day. Just as soon as one crop comes off, another must follow in its wake. We frequently gather onions, lettuce, etc., taking off, say, the space of three or four sashes each morning. Well, this ground should be raked and spaded over, and planted again right off within an hour after the crop is gathered. When some more stuff is gathered, commence where you left off, and break up ground again, and put in the crop. As a rule, our plants are raised in the seed-bed, as thickly as they can stand, until they get the third or fourth leaf. Then they are transplanted, as I have said, to where a crop has just been gathered. In transplanting, we use the transplanting-boards I have so often mentioned. We now have in use five. The closest spacing-board is for celery-plants, 2 inches apart. The next is for cabbage-plants, beets, onions, etc., 3 inches apart. Then we have one for stuff that is a little larger, or wants more room,  $4\frac{1}{2}$  inches apart. This is used for twice transplanting, or tomatoes and bushy plants for first transplanting. Then comes the board with the points 7 inches from center to center. This is just right for lettuce, spinach, tomatoes twice transplanted, and a variety of other stuff. The fifth and last one has the points a foot apart. Of course, they are all arranged hexagonally, so as to utilize space that is valuable. This last board, that spaces them a foot apart, is for strawberries where the runners are kept off; for early cabbage-plants to mature under glass, for potatoes grown under glass, etc.

Let us now get back to gathering the matured crop, or nearly mature. Before cleaning off the bed entirely (say of lettuce, spinach, etc.), we first cut out the largest plants where they seem to be crowding. With spinach we go over

the bed in this way and keep out any that seem inclined to shoot up to seed. This process can be carried on until it is evident that all the plants in the bed have plenty of room, and are about as good as they will ever get. Then we begin at one end, say where plants are the largest and strongest, and will probably not get any better by being left longer, and clean the bed off entire.

It is a great mistake to cut a crop when it is half grown. Sometimes, however, it pays to do this. In February a customer was very anxious for some spinach. I told him if he was willing to pay 20 cts. per lb. for it I would cut some that was only half grown. This they agreed to do. Now, when the plants are about as large as they will be we get 10 cts. per lb. for it. It is packed for retailing, one pound in a clean new half-peck basket, and the demand is beyond the supply. Why, friends, if this beautiful plant can be really grown under shutters instead of sashes it would be about the nicest business in the world to grow it at 5 cts. per lb.

For spinach the ground must be exceedingly rich—just such ground as we talked about in our last issue, for the new celery culture. The beds where it grows should be largely well-rotted manure. If a part of it is cow manure, all the better; then put on some bone dust and ashes besides, and make the leaves take on that strong rank dark-green appearance. If grown in this way, spinach, like lettuce, will sell almost every day in the year; but on ordinary soil, where the leaves look yellow and sickly, your customers will tell you that they "don't want any."

Speaking of shutters reminds me that I have never yet had a shutter that suited me, and I have spent a good deal of time and experimenting along that line. One of the heaviest expenses in our market gardening is broken glass. If the children do not break the glass in throwing stones, somebody's dog will take a notion to walk over the beds. Well, shutters made of boards will do just as well as glass when the plants are only to be covered nights, or, say, during the most severe freezing weather. These shutters are not broken like glass—that is, if well made; and they ought to be so light that one man can easily handle them. Friend Cummings, of the Lake Shore Canning Factory, has grown nice tomatoes with only boards for protection. The boards are only one foot wide. Sometimes when the frost is severe he uses a cloth cover with boards on top of it. One man can pick up boards a foot wide, and pile them up quite rapidly; whereas, to handle sashes it usually takes two men. Well, now, the idea of shutter should be exactly the size of our sashes. It should be as tight as a sash, and it should stand storms of snow and rain, and the intense heat of the sun, without shrinking and swelling so as to roll up the lumber or make the cracks large enough to let frost through, and at the same time we want it light. The board covering need not be more than  $\frac{3}{8}$  of an inch thick, if the frame around the outside is made of something heavier to protect the edges. If any of our gardening friends have succeeded in producing a light shutter to take the place of glass I should be very glad to see one. I think there is a field here for inventive genius. The ordinary way is, I believe, to use thin matched lumber in narrow strips, for the narrow strips will not shrink and swell as badly as the wider pieces; but  $\frac{3}{8}$  stuff, or even  $\frac{1}{2}$ , is very apt to get shattered and broken unless it is well protected by battens. The nails should be driven through and clinched. Then the extreme end of the shutter should have some protection as well as the edges along

the sides. The picture of shutters given in Dreer's book seems to be simply narrow matched lumber  $\frac{3}{4}$  or  $\frac{1}{2}$  thick. That will do very well, but this makes them heavier to handle than they really need to be. After snowstorms are all over, cotton cloth will do very well in place of shutters. But cotton cloth is liable to be weighted down by heavy snows, even in April, in our locality. Shutters are not only needed to keep out frost, but to protect the plants from the heat of the sun when they are just put out; to shade lettuce so as to have it bleached as I have explained; to protect tender tomato plants from being whipped by cold winds, and for ever so many other purposes. Even if we have the cotton sheeting to be rolled up on poles, we want shutters to cover little patches of something or other to follow up where we are transplanting. Now, if any of you have studied on this matter of cheap shutters, I wish you would send me a description of what you have, or a little model, by mail.

#### HOW TO GROW SQUASHES AND NOT HAVE THEM ALL DESTROYED BY BLACK BUGS AND BORERS IN THE ROOTS.

I have tried every thing that I have heard of except late planting. They understand raising them in Ohio, for there are lots of Hubbards shipped in here from Toledo. I have had a total failure for two years. One year I had two acres, and lost every plant after going over them five times, picking bugs and dusting the vines. C. H. BILLINGHURST.  
Albion, Mich.

We have had more or less experience every year for many years past in growing squashes, and we have "licked" the bugs every time—that is, where we grew them on our rich creek-bottom land. On our upland soil we have several times made almost entire failure. First, you want rich bottom land suitable for squashes. Then it wants to be manured tremendously with old well rotted manure. You want to read "Gregory on Squashes" to get an idea of the amount of manure really needed for a crop.

In regard to bugs, when the squashes are small the only dead-sure thing we have ever found is to cover them with wire-cloth bug-protectors. These are pressed down over the hills, and the dirt packed around so no bug, black or striped, can get under the edges. It takes a good many bug protectors for an acre, it is true; and we have of late years succeeded very well by covering the young plants pretty well with tobacco dust. This is worth almost all it costs, for a fertilizer; but if you have frequent rains heavy enough to wash the tobacco dust off, it will take several applications. After the plants get so large as to crowd against the wire cloth they will usually take care of themselves, but not always. If they do not, you have got to fight; hand-pick the bugs; examine the under side of the leaves for eggs; and if you follow the business right up you will generally come out ahead. The bugs evidently know when a man really means business. The squash grower ought to have a good-sized family of children; and if they all have a common interest with the father in the work the bugs will generally give it up.

The worst trouble when the vines get to running is the borer in the pith of the vine; and there is only one remedy I know of, and that is to cover the vines with earth every yard or so as soon as they begin to run. In good soil, and with plenty of rain, the vines will take root at the joints very quickly; and if the borer commences near where the plants started originally, the damage it does will be only temporary. Plant-lice on the roots are something I have

never had any experience with; but I have been told that, if you make a little hole in the soil with a stick, and pour in a little bisulphide of carbon, you will get rid of the plant lice. Of course, you must be careful not to kill the plants. Hubbard squashes are raised successfully all over Northern Ohio; and we had some very fine ones brought us as late as the first of April this year.

Let me again emphasize having the ground exceedingly rich. I know a man who cleaned out his poultry-house, and put the contents on his garden so much in one place that he could not grow any thing that season—not even squashes. The next year he plowed it up very deep, and had an enormous crop of Hubbard squashes. The ground was so exceedingly rich that the bugs could not stand it. In fact, I have heard of putting so much strong manure around squash-vines that the bugs could be seen going away holding their noses. Strong, rank, offensive manure will very often give the vines such a start that the bugs can not well harm them, and at the same time will repel them by the rank odor. Where the ground is too poor to give a vigorous growth, the bugs seem to make the most havoc.

#### THE FIRST REPORT OF COWS THAT WILL NOT EAT SWEET CLOVER.

My cow has the range of 40 a res part of the time—one acre in sweet clover, now in luxuriant growth, a foot high, in its second year, and I have not yet seen her touch it, though she eats the alfalfa next to it with relish.

#### SUGAR-BEETS.

You say the sugar-beet belt is through Wisconsin and Northern Ohio, south of Lake Erie. Perhaps you are not aware of the thousands of acres here in the Pecos Valley, where our constant sunshine enables us to raise sugar-beets, which, with our crude experience of a first season just closed, enabled us to raise beets not only of 14%, but by the scores of acres 16 to 20% sugar. One carload ran from 19 to 21%; and this can be done on 10,000 acres, yet in unbroken natural state, with our irrigation facilities. I raised beets last season, one of which—not an exceptionally large one by any means—weighed 15 lbs. 6 ozs. with top, and 9 lbs. 11 ozs. as trimmed for the factory.

#### A HOUSE-APIARY THAT PROVES SATISFACTORY.

On page 242 in Dr. C. C. Miller's remarks on house-apiaris, he says some like them, some do not. I have one for 139 colonies; have just had photo taken of my ranch. You will have no difficulty in picking out the house-apary. I can do more work at my bees in the house in three hours than I can at the bees outdoors in a whole day; no need for veil, and very little for smoker. Every thing is at hand to work with inside. Bees are not so irritable—no robbing to amount to any thing; all in shade; swarming, not enough to consider; have not had a swarm yet, and have used it over one year. Mine is, I think, unique—so far as I know the only "adobe" bee-house in existence. If there is, or has been one before, I should like to know. My lives are set back 3 inches from wall; bees at liberty to come into the house if they wish, but they don't.  
Eddy, N. M., Apr. 12, 1902. JOHN SINGLETON. □

Friend S., if your cows should run out of feed, and be obliged to eat that sweet clover, my opinion is that, after they have learned how, they would take it in preference to any thing else. Your locality, however, may make a difference. It is not at all strange that they should take the alfalfa first, especially if they are used to it; for I tell you alfalfa comes pretty near being the best "feed" that the world supplies.

We rejoice with you in regard to your success with the sugar beet.

In regard to the house apary, that may be a little out of this department, but I guess most of the bee-friends will see it. I am very glad to

receive such a report; and if you did not live so very far away I should be almost tempted to take a trip down there to see one that works so successfully and is liked by its owner. I wish you would tell us how many years you have used it. Lots of people have reported somewhat as you do; but after they have had the thing three or four years, somehow it gets to be neglected and "beeless."

#### MORE ABOUT THE APPLE-TREE BORERS.

Quite a number of remedies have been sent in of late, and among them white paint applied to the trees from the roots up about two feet. Before giving space in print to these remedies, however, I thought best to submit them to our Ohio Experiment Station. Below is what our good friend Prof. Green says in regard to the matter:

I do not know any thing regarding the virtue of white lead for borers, but I do not think it would do any good. Whitewash containing carbolic acid is good. Soft soap and carbolic acid are good also—perhaps the best preparation known. Carbolic acid is the active agent; and if it were added to paint the mixture might be good. There is nothing known that will keep away all borers, and the best preparations are only partially effective.

Wooster, O., April 22. W. J. GREEN.

This corroborates, I believe, the experiences of the experiment stations of other States.

#### SACALINE AND FLAT PEA.

The following is the report the North Caro-

"UNKNOWN" COW-PEA.—Large, irregular, light brown. Best of all peas for forage or green manure. This pea has been imposed on the public under name of "Wonderful." It is a very late pea.

Very likely this pea would not mature seed as far north as we are; but it is not a very expensive matter to get the seed from a little further south where it is grown.

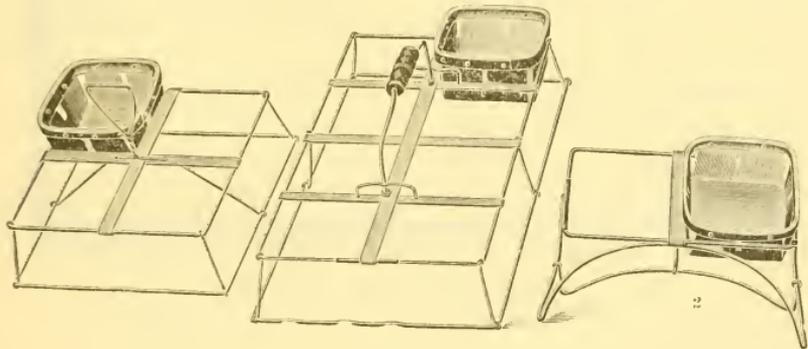

#### SOMETHING NEW FOR BERRY-PICKERS.

We are in the habit, as our readers may be aware, of advertising, free of charge, new things that come up, where they are sufficiently meritorious. The arrangement below, we think, comes under this head.

Our friends will notice that No. 4 and No. 8 have handles for carrying them, and they are so made that they may be set down in the path or on top of the berries, without crushing any of the fruit nor being liable to tip over. No. 2 is to be fastened around the waist with a buckling strap, piece of tape, or any thing suitable.

For picking raspberries, No. 2 is especially handy. We know this because we have used a similar arrangement for carrying the single boxes. Having two boxes is still better. Here is what the inventor says in regard to it:

The whole idea is less than sixty days old, and born of necessity. I wanted to sort strawberries as they were picked, and I could not do it with one basket. I will make any size opening desired or boxes. Pittsford, Mich. N. J. KIDDER.

KIDDER'S BERRY CARRIERS.

lina Experiment Station has to make in regard to these two plants. Their verdict differs but little from that of our Ohio Experiment Station.

**SACALINE.**—*Polygonum saghatinse*. Perennial, tall, bushy, broad-leaved plant of the knot-weed family. Grows about four feet high. Stems are woody, and the broad, oval, heart-shaped leaves are diseased by a species of rust fungus. Has no value for North Carolina.

**FLAT PEA.**—*Lathyrus sylvestris Wagneri*. A perennial legumine. Grows three or four feet long, weak and flat on the ground. Requires three or more years to secure a stand, and is then of no practical value for North Carolina.

#### COW-PEAS.

This same station has the following report to make in regard to the cow-pea, which we have advertised in our seed catalog as "Wonderful" by name:

The carriers are made entirely of metal, and are to be either varnished or galvanized so they will stand all kinds of weather. With strawberries our boys have been in the habit of taking a nest of boxes; and as fast as they get a boxful it is set down in the path. When they get to the end of the row they go back and gather them up. The greatest objection to this plan is that every little while a box of nice berries will be skipped and left out over night or longer. Another trouble is, some juvenile kicks a box over. When the sun is shining hot we always want our berries in the shade about as soon as a boxful is picked. One trouble with baskets holding eight or sixteen boxes is that every little while somebody loses the slats, or they are stepped on and broken. These carriers have nothing loose about them, to get lost. I should mention that the handle in No. 8 shuts down so that the carriers may be nested in transportation, one slipping inside of the other.

West Groton, N. Y.

**WANTED**.—To exchange one microscope in mahogany case, for photographic outfit, kodak preferred.  
L. L. ESENHOWER, Reading, Pa.

**WANTED**.—To exchange Italian queens, bred from imported mothers, for plants, seeds, pet stock, or Cowan extractor. What have you to offer?  
J. H. GARRISON, Cor. Louisville and Cheltenham Aves., St. Louis, Mo.

## Black and Hybrid Queens for Sale.

I have about 30 fine golden, mismated, and hybrid queens at 25 cts. each, for five for \$1.00. They are good queens.  
G. RUTZAHN, Menallen, Pa.

A few mismated and hybrid queens for sale at 20 to 30c each.  
F. C. MORROW, Wallaceburg, Ark.

#### SECOND-HAND FOUNDATION-MILLS.

Those interested in second-hand foundation-mills will do well to write for a list of what we have, with samples of foundation made on them. Indicate the size you want, and the grade of foundation you wish to make.

#### SPECIAL BARGAINS.

We call attention to the three bargains on the third cover page of this issue. We are already shipping quantities of the Mason Jars, and the bicycles are selling here like hot cakes. We have already sold here in Medina almost two dozen of these Ajax wheels, and they are giving the best of satisfaction.

#### MAPLE SUGAR AND SYRUP.

Our surplus stock of these has been sold, although we shall doubtless be able to secure what is needed for any orders that we may receive. We shall hardly be able to make quite as low prices on syrup as we have quoted. For the present we ask for syrup 90 cts. per gallon; 10 gallons, \$8.50; 20 gallons and upwards, 80 cts. per gallon.

#### EXTRACTED HONEY.

Those in need of choice extracted honey to supply their home market till the new crop is harvested, we can furnish in one-gallon cans the choicest Wisconsin honey at \$6.50 per case of 8 gallons; 2 cases at \$6.25; 5 cases or over at \$6.00 per case. Less than a full case at 85 cts. per gallon (12 lbs.). We have also the same quality honey in 60-lb. cans, two in a case, at 7 cts. per lb.

#### DRAWN FOUNDATION.

The demand for sample lots of the drawn foundation is such that we have not been able to get sufficient stock ahead to keep going while we complete the dies to their full size, 5x8 inches. We are still furnishing the drawn foundation in pieces 2x4 inches, about 8 feet to the pound, cells about  $\frac{1}{8}$  inch deep; 6 such pieces with other goods 10 cts., or postpaid for 12 cts. A box of  $\frac{1}{2}$  lb., or 72 pieces, for 75 cts., with other goods, or prepaid for \$1.00.

#### BUSINESS AT THIS DATE.

Orders, especially for sections, were crowding us at such a rate that we have for the past two weeks been running our wood-working department night and day, with two gangs of workmen, and may continue to do so for several weeks to come. We are turning out sections at the rate of 100,000 every twenty-four hours, yet we have been obliged to order a car from another manufacturer to help us out. We don't propose to get behind on orders very far if we can avoid it. We are filling all orders with reasonable promptness, very few remaining in our hands unfilled for a week or longer, and most orders going out within one to five days after being received.

Several carloads have been shipped since last report—one to New York for export, another to Liverpool, England; one to Rawlings Imp't Co., Baltimore, Md.; one to Jos. Nyssewander, Des Moines, Iowa, and one to Henry F. Hagen, Rocky Ford, Colo. As we go to press we are loading a car for Syracuse Branch, and another for M. R. Madary, Fresno, Cal.

### Special Notices in the Line of Gardening, etc.

By A. I. Root.

#### CANADA FIELD PEAS.

We can furnish a very nice article,  $\frac{1}{2}$  peck, 25c; peck, 40c;  $\frac{1}{2}$  bushel, 70c; bushel, \$1.25. Ten bushels or more, \$1.00 per bushel. The above includes bags for shipping.

#### SWEET-POTATO PLANTS.

We have now a splendid stock of the two vineless

varieties—General Grant and Bunch Yam. We have also nice plants of Yellow Jersey and Early Peabody. Price 5c for 10, 40c per 100, or \$3.00 per 1000. You will notice we are offering the new General Grant and Bunch Yam at the same prices as the ordinary sweet potatoes. Later in the season we may be able to give better prices on lots of 5000 to 10,000.

#### TWO MORE VALUABLE BOOKS.

Our veteran friend Henry A. Dreer has given us two more books, companions to that excellent work which is having such an immense sale, "Gardening under Glass." The titles of the new books are, respectively, "Grasses and Clovers, with Notes on Forage-plants;" and the other, "Open-air Vegetables." The three are called "Dreer's Library." Bee keepers will be especially interested in the "Grasses and Clovers" book, because it has so much to say about plants that bear honey. The frontispiece shows us a photo of six tons to the acre of hay grown by Geo. M. Clark, of Higgrum, Ct., and he tells exactly how Mr. Clark did it. The book discusses fully all the clovers, and, in fact, all plants that have "butterfly" blossoms. Those we are most interested in are alfalfa, alsike, bokhara, crimson clover, cow pea, flat pea, Japan clover, mammoth, medium, soja bean, taraxac (or vetches), trefoil, etc. The book gives the quantities of seed to sow per acre for every one of them, and more or less particulars in regard to the cultivation. There is also a chapter on root crops. Reports from crimson clover are given from different States. The impression seems to be that crimson clover will grow more or less throughout the Northern States when we learn how to manage it. If our readers could see our crimson clover this morning (April 26), I think they would have faith that it can be grown in Northern Ohio.

The other book, "Open-air Vegetables," is a general treatise on growing vegetables without glass. There are quite a number of pictures of crops that are alone worth considerable to the gardener. There is just one picture of a crop of spinach, grown under shutters, that is worth to me a great deal more than the price of the book. I have for some time had the impression that spinach might be grown to perfection, without any glass at all—just board shutters—but I did not know that anybody had ever tried it. Here is a picture of the whole thing. The worst part of it is, however, the picture is all there is to tell the story. The book does not give any directions at all how to do it.

We can furnish either of these books for 20 cts.; postpaid by mail, 25 cts. each.

#### THE HAND-POWER BREED WEEDERS.

This morning, April 28, I feel like calling the Breed weeder the greatest invention that was ever made in agriculture. The company make a hand-weeder that costs about 50 cents. I will try to give an illustration of it in our next issue. This implement has been lying in our tool-house almost a year, and yet nobody had found out how to use it. Last Sunday we had a tremendous April shower. It made such a crust between our plants in the plant-beds that the ground had begun to crack. I knew by experience that this would greatly injure and even kill many plants just set out. I thought of the Breed weeder, and in a few hours I had the ground nicely broken and fined up between beets, radishes, cabbage-plants, lettuce, and almost every thing else. It is really a stiff broom, made of steel wires, that mashes up the dirt and little weeds while the wires slip around all plants that have sufficient root to stand. In some beds of choice strawberries, planted 18 inches apart, it just made the whole bed look beautiful; and it was done about as quickly as you would sweep a floor with a broom.

After we had got the beds finished we took the tool out among the currant-bushes, choice raspberries, and even among the pie-plant that had just been cultivated. The ground was in just that state of mellowness after the rain so the weeder would pulverize and smooth it down. Why, it made every thing look as if the whole premises had been swept with a broom, sweeping out all the little weeds, and leaving the plants. If you want to know more about these machines, write to the Z. Breed Weeder Co., 26 Merchants Row, Boston.

After we got through in the garden across the street, two boys took the onion-weeder and went through a patch of onions that were just coming through the ground; and in a very short space of

time they made that onion-patch look as if it had been swept with a broom, killing all the weeds, and not hurting the little onions. You see, the onions were planted deep enough so they would not pull out, while the weeds on the surface were all pulverized. Then we went over some ground where we had sown parsnips and carrots, but the seeds had not yet come up. The success of these tools depends absolutely on working the ground when it is just right after a rain, and keeping it stirred so the weeds have no chance whatever to get a start. We have just planted out half an acre of strawberries, and we propose to do the whole cultivation of these entirely with the weeders.

#### CHOICE POTATOES TO BE GIVEN AWAY.

We find ourselves in much the same predicament that we were a year ago, with more potatoes on hand than we are likely to sell; and if we are obliged to give things away we much prefer to give them to patrons of GLEANINGS; therefore we make the following exceedingly liberal offers:

A BUSHEL OF MAULE'S THOROUGHbred, WORTH \$1.50, FOR ONE NEW NAME.

You will notice by the table on page 309, last issue, that a bushel of thoroughbreds is worth \$1.50 according to our latest reduction. Instead of a bushel of firsts you may have, if you prefer, two bushels of seconds.

HALF A BUSHEL OF THOROUGHbreds, WORTH 85 CTS., FOR EVERY RENEWAL AFTER PAYING UP BACK DUES.

Or you may have a whole bushel of Thoroughbreds, seconds, for renewing.

A WHOLE BARREL OF POTATOES, SIR WILLIAM OR NEW QUEEN, FOR ONE NEW SUBSCRIBER.

Or we will give a barrel of New Queen seconds for every renewal.

A WHOLE BARREL OF NEW CRAIG SECONDS, WORTH \$1.25, OR 1/2 BARREL OF FIRSTS FOR EVERY NEW SUBSCRIBER, OR HALF THAT AMOUNT FOR EVERY RENEWAL.

We do not make the above extraordinary offers on these potatoes because they are inferior or of poor quality, but because they were mostly raised on our own grounds, and we had such an extra large crop that we can afford to be liberal with them.

Now, if you prefer some other potato you may select any thing from the table on page 309, at the rate of a dollar's worth of potatoes for every dollar sent us for a new name, or 50 cents' worth for every renewal; and you may have any thing mentioned on the table in this last offer that is not sold out. There are several kinds of which we are nearly sold out, but not quite. We have sold out all of our own growing of the White Bliss, but have made a purchase of some grown away up north in Maine. These will be on hand by the time this reaches your eye, and we will include them at the same rate. Permit me to say that our potatoes are all of them in much better condition than they were a year ago. We are learning by experience. At present writing there are none of them sprouted to hurt them, and very few of them are at all wilted. You need not be afraid of its getting too late to plant potatoes, for you will notice by the report from our Ohio Experiment Station, page 253 of our last issue, about planting as late as July. For many years our best crops of potatoes have been secured from planting along the latter part of June or fore part of July providing the seed is kept in good order until ready to plant.

We have not made any special offers on Manum's Enclosure, because of its wonderful keeping properties. We planted them last season toward the middle of July, and the seed was firm and solid, without a sprout or any wilting. We also secured a good crop of nice potatoes, from this very late planting.

### Kind Words From Our Customers.

The goods came all right, every piece being a perfect fit. I am much pleased with the hives, which are just beautiful when completed.  
Sand Lake, N. Y. ARTHUR M. PECK.

Going to have a great year for honey; took off some new comb honey last week. J. I. FOOTE.  
University Heights, Cal., Apr. 17.

I have taken GLEANINGS a good many years. I like it very well. I like Rambler's story. When it ends, by all means give us another one. Yes, continue footnotes; they are the spice of the paper.  
Colebrook, O. JAMES KELLY.

#### CONVENTION NOTICE.

The spring meeting of the Northern Illinois Bee-keepers' Association will be held at the residence of H. W. Lee, at Peconica, on Tuesday, May 18, 1897. All are cordially invited to attend. Means of conveyance will be at the depot for the benefit of those who come on trains.  
B. KENNEDY, Sec.

## Root's Goods.

Before placing your order for this season, be sure to send for Root's

### 1897 Catalog, ready now.

Our 1897 hives, with improved Danzy cover and improved Hoffman frames, are simply "out of sight." Acknowledged by all who have seen them to be a great improvement over any hive on the market, of last year.

### Comb Foundation.

Cheaper and better than ever; clear as crystal, for you can read your name through it. Process and machinery patented Dec. 8, 1896, and other patents pending. Samples of the new foundation free.

### The A. I. Root Co.,

Main Office and Factory, Medina, Ohio.

Branch offices at 118 Michigan St., Chicago; Syracuse, N. Y.; St. Paul, Minn.; Mechanic Falls, Me.; No. 10 Vine St., Philadelphia, Pa.

FOR SALE.—200 Cases, two 60-lb. cans to case, at 35 cts. a case. I have a large quantity of them; they are new cans, clean and nice inside, but my using steam in storage warehouse caused them to be a little rusty outside. Order 10 cans as sample; speak quick.

Honey Column.

CITY MARKETS.

CHICAGO.—Honey.—Fancy white, 13; No. 1, white, 10@12; fancy amber, 9; No. 1 amber, 7; fancy dark, 7@8; No. 1 dark, 7; white extracted, 5@7; amber, 5@6; dark, 4@4½; beeswax, yellow, 27@28. The market is bare of comb honey, and it is well for there is practically no call for it. A few people use it all the time, but their wants are provided for. Beeswax active for fancy grade.

R. A. BURNETT & CO.,

163 So. Water St., Chicago, Ill.

May 7.

MILWAUKEE.—Honey.—Fancy white, 13@14; No. 1 white, 11@12; fancy amber, 9@10; No. 1 amber, 8@9; white extracted, 6@6½; amber, 5@5½; dark, 4@5; beeswax, 26@27. Since our last advice the market on honey has been fairly sustained, and the supply has been somewhat reduced; yet our stock is fair, but we are inclined to the opinion that it will all be wanted before a new crop. The common quality of comb we find rather difficult to dispose of. Extracted has been in fair demand at quotations. Most demand for the lowest value.

A. V. BISHOP & CO.,

Milwaukee, Wis.

May 7.

ST. LOUIS.—Honey.—Fancy white, 12½@13; No. 1 white, 11½@12; fancy amber, 10@11; No. 1 amber, 8½@9; white extracted, in bbls., 5; in cans, 6; amber, in bbls., 4½; in cans, 4½; dark, 4@4½; beeswax, 27@28. It is a little late in the season for manufacturers to use much extracted honey in barrels. Choice white comb honey in good demand.

WESTCOTT COMMISSION CO.,

213 Market St., St. Louis, Mo.

May 8.

CINCINNATI.—Honey.—No. 1 white, 12@14; No. 1 amber, 10@12; No. 1 dark, 9@10; white extracted, 5@6; amber, 4@5; dark, 3½@4; beeswax, 22@25. Demand slow for all kinds of honey. Demand fair for beeswax.

CHAS. F. MUTH & SON,

Cincinnati, O.

May 7.

NEW YORK.—Honey.—Fancy white, 11; No. 1 white, 10; fancy amber, 9; No. 1 amber, 8; fancy dark, 6½; No. 1 dark, 6; white extracted, 5@5½; amber, 4½@5; beeswax, 26.

HILDRETH BROS. & SEGELKEN,

120-122 W. Broadway, New York.

May 8.

MINNEAPOLIS.—Honey.—Fancy white, 12@13; No. 1 white, 10@12; fancy amber, 9@10; No. 1 amber, 8@9; fancy dark, 7@8; No. 1 dark, 6@7; white extracted, 6@7; a bar, 5@6; dark, 4@5; beeswax, 22@25. Market remains unchanged for both extracted and comb.

S. H. HALL & CO.,

Minneapolis, Minn.

May 8.

KANSAS CITY.—Honey.—Fancy white, 12@13; No. 1 white, 11@12; fancy amber, 10@11; No. 1 amber, 9@10; fancy dark, 8@9; No. 1 dark, 7@8; white extracted, 5@5½; amber, 4½@5; dark, 3½@4; beeswax, 25.

C. C. CLEMONS & CO.,

423 Walnut, Kansas City, Mo.

May 8.

COLUMBUS.—Honey.—No honey on the market. Quotable fancy white, 12½; No. 1, 11.

THE COLUMBUS COM. & STORAGE CO.,

May 8. 409-413 N. High St., Columbus, O.

DENVER.—Honey.—Fancy white, 11; No. 1 white, 10; fancy amber, 9; white extracted, 6; amber, 5; beeswax, 25. We find the sales are improving, but we can not quote better prices. There is too much off grade in the market, and it keeps the price down.

R. K. & J. C. FRISBEE,

Lock Box 1014, Denver, Col.

May 10.

PHILADELPHIA.—Honey.—White extracted, 5@5½; amber, 4@4½; dark, 3½@4; beeswax, 25. No comb honey in this market but odds and ends. Nobody wants comb honey now. Considerable call for extracted. Beeswax in constant demand.

W. M. A. SELZER,

10 Vine St., Philadelphia, Pa.

May 8.

BOSTON.—Honey.—Fancy white, 13; No. 1, 11@12; white extracted 7@8; amber, 6@6; beeswax, 25. As warm weather advances, the demand for honey drops off; and, while supply is light, it is fully equal to the demand. Beeswax wanted.

E. E. BLAKE & CO.,

57 Chatham St., Boston, Mass.

May 10.

CLEVELAND.—Honey.—Fancy white, 12@12½; No. 1 white, 11; fancy amber, 8@9; fancy dark, 7@7½; white extracted, 6; beeswax, 28@30.

A. B. WILLIAMS & CO.,

80-82 Broadway, Cleveland, O.

May 14.

DETROIT.—Honey.—Fancy white, 10@12; No. 1 white, 9@10; fancy amber, 8@9; No. 1 amber, 7@8; fancy dark, 7; white extracted, 5@6; amber, 4@5; dark, 4; beeswax, 25@26. Fancy white comb is not so plentiful, and has sold a shade higher.

M. H. HUNT,

Bell Branch, Mich.

May 11.

FOR SALE.—Fancy extracted in 60-lb. cans, and fancy comb (Danzy sections) mangrove honey in 30-lb. cases. Cash offers wanted, f. o. b. here.

H. PRICE WILLIAMS, Miami, Florida.

FOR SALE.—Several hundred pounds extra-quality white extracted honey, in new 60-lb. cans (by sample) to the highest bidder.

O. H. TOWNSEND,

Alamo, Kalamazoo Co., Mich.

QUEENS

Untested, 50c; doz., \$6.00

Warranted, 60c; doz., \$7.00

Tested, 75c; doz., \$8.00

Imported Italian mothers only are used, and for industry, gentleness, and beauty their bees are unsurpassed. We have in our yard bushels of drones from imported mothers and their daughters, and a mismatched queen is rare. No defective queens sent out. Remember that we are in the far South, and can send queens by return mail. Safe delivery. Money-order office, Decatur.

CLEVELAND BROS., Stamper, Miss.

Closing-out Prices on First-class Goods.

10 No. 1E Dov. hives, 8-frame, - \$7.50

10 No. 1E Dov. hives, 10-frame, - 8.50

Best polished sections, \$2.50 per M. Other goods in proportion. Let me make an estimate on your wants.

W. J. Finch, Jr., Chesterfield, Ill.

The King Windwheels. Only 1 inch thick edge-wise. Six-foot wheel does all general work. Weight of wheel 6 lbs. Latest and highest standard of excellence. Best of galvanized towers. Write to day for full information to

C. O. WEIDMAN, Sole Mir., Medina, Ohio.

RED-CLOVER ITALIANS

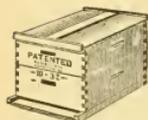

Are fine large bees that work well on red clover. Are bred for business. One untested queen, 65c; two for \$1.25; one warranted queen, 80c; two for \$1.50; one tested, \$1.25; 1 select, \$2.00. Queens furnished in season, and satisfaction guaranteed.

C. T. HICKS, Hicksville, Wash. Co., Md.

# 1000 First-class Sections for only \$1.50.

I have on hand about 40,000 strictly first-class 4 $\frac{1}{4}$ x4 $\frac{1}{4}$  one-piece sections. For such sections the leading dealers are asking from \$2.25 to \$3.00 for a single 1000, but I am anxious to turn these sections into money as soon as possible, and also anxious to increase my subscription list; therefore, as long as any remain unsold, I shall offer 1000 sections and the Review, to new subscribers, for only \$2.50. I will also furnish a tested Itali in queen and the Review one year, to new subscribers, for only \$1.50; or a Bingham Conqueror smoker and the Review for only \$1.75.

W. Z. HUTCHINSON, Flint, Mich.

Bingham Smokers have all the new improvements. Before buying a Smoker or Knife, look up its record and pedigree.

FIFTEEN YEARS FOR A DOLLAR; ONE HALF CENT FOR A MONTH.

Dear Sir:—Have used the Conqueror 15 years. I was always pleased with its workings, but thinking I would need a new one this summer, I write for a circular. I do not think the 4-inch Smoke Engine too large. January 27, 1897.

Truly, W. H. EAGERTY, Cuba, Kansas.

T. F. BINGHAM, Farwell, Michigan.

Bingham & Hetherington Uncapping-knife.

# A Penny Saved is a Penny Earned.

Yes, it's better than that, for the saved penny you don't have to earn twice. Well, the Weekly American Bee Journal will help you save your pennies. It is a real money-saver to the bee-keeper who will read and practice its teaching. The regular price is \$1.00 a year, or only about two cents per copy. But in order that new readers may give it a trial we will send it for only 50 cents from the time we receive your subscription to the end of 1897. Now, the sooner you send the half dollar, the more copies you will receive. Send 1c stamps if more convenient. Sample copy free.

GEORGE W. YORK & CO., 118 Michigan St., Chicago, Ill.

Vol. XXV.

MAY 15, 1897.

No. 10

### STRAY STRAWS

FROM DR. C. C. MILLER.

SECTIONS fresh from the factory don't need any wetting before making.

ONE POUND of Root's thin foundation, cut to fill sections full ( $3\frac{1}{8} \times 3\frac{3}{8}$ ), will fill from 92 to 112 sections.

GALLUP reports in *American Bee Journal* that his bees worked on buckwheat six miles away, and didn't seem much exhausted with the journey.

BOTTOM STARTERS have been objected to by some; but I am reassured by the strong indorsement R. C. Aikin gives them, p. 330, and feel just a little proud that I was the "starter" of the plan—at least I *think* I was. [Yes, I think you were the starter.—Ed.]

PIOUS MEN are reminded that, if the Lord hears the grace they say at meals, he also hears the comments they make to their wives afterward.—*Atchison Globe*. [That is so—pass the paragraph around. Perhaps its general circulation will lift the plane of Christian living in the heart of many a man.—Ed.]

IF SECTIONS must have joints wet before making, use *boiling* water. Use a funnel with a wooden plug that nearly stops it, and have the plug whittled down to a point. Then the fine stream of hot water running from the point will run down through the whole box, using little water and wetting only the joint.

BRO. AIKIN, on p. 319 you think the difference in appearance of sections with the dovetailed corner is "not enough to be seriously considered." Your morals must be looked after. When the dovetailed corner is up it has an unpleasant one-sided appearance, and, besides, you can't clean the glue from the dovetails as you can from a plain corner. [What do you say to this, Bro. A.?—Ed.]

MR. EDITOR, on page 338 you say you'll cut off  $\frac{1}{4}$  inch from each end of your top-bars. I

did that thing, and now wish I had cut off only  $\frac{1}{8}$  inch, for I think you'll find the projections of Hoffman top-bars are  $\frac{1}{8}$  instead of  $\frac{1}{4}$ . [If you will turn to the editorial in question you will find that I said *about*  $\frac{1}{4}$  inch. For the Dove-tailed hive,  $\frac{1}{8}$  is a little more exact than "about  $\frac{1}{4}$  inch," and perhaps I should have so stated.—Ed.]

APIS DORSATA. The plan of testing their domestication on their own ground, as proposed on p. 839, is just what I have advocated. But I think it's a serious mistake to say, "If they could not be domesticated they might be of advantage in the fertilization of certain flora by letting them run wild in the South." What flora needs fertilization? Wouldn't wild *dorsata* consume honey that without them would go into hives? [Very likely you are right.—Ed.]

EXTRA-THIN FOUNDATION has not suited me as well as thin, for two reasons: It sags more, and the bees gnaw it when a lull comes in storing. Now, if drawn foundation doesn't sag, and the bees don't gnaw it, and it can be had as thin as extra-thin foundation, I think I want it. [You do not even now state, doctor, whether the extra-thin foundation that did not suit you as well as the thin was the new or old process. The new process thin is now as thin as the old extra thin.—Ed.]

T. F. BINGHAM *may* be right, p. 325, about sections being filled with honey, "half of which has been brought up from the previous year's gathering, to make room for brood," and I think he's in accord with the popular idea; but I'm a little skeptical about it. Before the honey-flow begins, don't the bees empty the cells of honey full faster than they fill them with brood? and when the flow begins don't they carry the *new* product upstairs? Did you ever find buckwheat honey in sections before clover harvest?

"AN OBJECTION to the bent nails" for end-spacing of frames, you say, Mr. Editor, on page 335, "is the difficulty of driving them into position." I take straight nails, drive them in

straight, then bend them after driving. No trick at all. See the sample I sent you some time ago. But I'm going to try the staples, and shall be glad if they prove better than nails. [Yes, it is true that a nail can be bent over; but on account of the spring of the wire the point of the nail generally fails to imbed itself into the end-bar; but staples, if you will try them, you will find to be very much better than nails. With the former the frames will hold their end-spaced position nearly  $\frac{3}{8}$  inch above the tin rabbet.—ED.]

OF TEN COLONIES WINTERED OUTDOORS, 80 per cent came through alive. Of the remaining 90 of the same apiary, wintered in cellar, 100 per cent came through alive. Those outdoors were well packed overhead with an extra story beneath, but no packing at sides. The winter was unusually mild. The other two apiaries were wintered in cellar, and all lived except three queenless, and one that (say, Mr. Printer, couldn't you print the next word smaller so it wouldn't be noticed?) starved. [I am surprised that you obtained as good results as you did with your ten colonies outdoors. If they had had packing *all around* I think you would have saved the other colonies, and the other eight would have been stronger. Packed space above is good, but not enough—at least for our locality; and, if I am any judge, the winters are much colder in Marengo than here in Medina. But your results in the cellar were good—very good.—ED.]

PROBABLY T. F. Bingham and B. Walker are both right. Honey to be called "fancy" should be *fancy*, and our fancy grade is so worded as to admit scarcely any honey. One trouble is, that the designation of grades is not strictly honest. When you stop to think carefully about it, you'll not consider the names "fancy" and "No. 1" a very strong testimony to the truthfulness of bee-keepers. [I have been consulting with a number of prominent bee-keepers in regard to the present rules for grading, and it is very evident that they need some slight modification. I believe it is useless to try to get a convention of bee-keepers to fix up a set of rules that will be generally acceptable; and if Bros. York and Hutchinson will go in with me we will take our present rules and make them more nearly what they ought to be. After all, it is the bee-journals that give currency and value to any system of rules that may be adopted.—ED.]

PAPER BETWEEN SHEETS of foundation is a nuisance for *this locality*. It takes an hour to pick the paper out of a 25-pound box, and it must take some time to put it there, and I don't know of any possible good it does. This year I had one box come without paper, and it came just as nicely as the papered. What's it papered for, anyway? [Our brood foundation is pa-

pered by machinery, and a little later on our thin and extra thin will also be papered in the same way. I am rather of the opinion, however, that there is no very good reason why paper should be used; and why we do is because we are afraid to try the experiment of leaving paper out. While the expense to us is but trifling, we should be very glad to leave it out entirely, if the trade would not object. We should be glad to hear from our readers on this point; and when authorized to do so we will willingly send out shipments without paper, but hardly dare to do it otherwise.—ED.]

ONE REASON why the Rietsche press is so popular in Europe is the amount of adulteration in the foundation that is sold. I'm heartily thankful that we can order foundation, and feel just as certain of its purity as of the water in our wells—perhaps more so. [The foundation-makers of this country know that the adulteration of beeswax for foundation purposes would be bad policy, both financially and morally; and very fortunately, as I have explained, the new Weed automatic sheeting-machine will not handle paraffine or ceresine, even when mixed with beeswax. There is a dental trade that calls for mixtures of beeswax and earth waxes; and in endeavoring to make the Weed sheeter handle such products we found it was worse than a balky horse. Even ten per cent of paraffine with pure beeswax would show itself in the sheets. Bee-keepers can, therefore, depend upon it that the new-process foundation must necessarily be pure, for it can not be new process and be adulterated.—ED.]

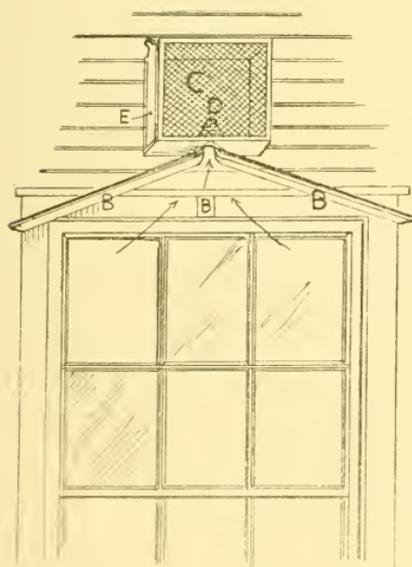

EMPHATICALLY, I believe friends Abbott and Thompson are right, on p. 321, in thinking that well-ripened honey, honey with a "body," is slowest to granulate. Also, friend Abbott is correct in placing alfalfa as the honey that interferes least with the flavor of whatever it sweetens. It has the least flavoring of any honey I know of, and I like it best in tea or coffee—or, rather, postum cereal. [We have been using postum cereal at our house for months back, and personally I very much prefer it to the best grades of Java or Mocha coffee. Lately we have been using what is known as magic cereal, and are inclined to prefer it, because there is no sweetening in it as is the case with postum cereal; and from a health standpoint, as a substitute for coffee it is very much better; and I believe the time is coming when many will say that it is not only better but very much cheaper. Cereal drinks are nutritious, while coffee is a narcotic, and decidedly an enemy to good digestion, if the word of our best physicians means any thing. Magic cereal, having no sweetening, would be more acceptable to the bee-keeper, as he could sweeten it with alfalfa honey just to his liking. Hurrah for magic cereal and alfalfa honey!—ED.]

By R. C. Atkin.

#### WINDOW ESCAPES AND TRAPS.

In a former article I told how I used our covered wagon in removing surplus, and some little about my method of carrying the honey into the honey-house and letting the bees out through the window. For several years I have had my honey-house windows screened in such a way that, as the bees passed up, they massed at one point and passed through a hole into a box or trap placed above. As an illustration will tell this better than words, we will show

you the arrangement. The trap should be about 8 or more inches high, as much wide, and 4 or 5 inches thick. One of the 4 inch sides should be made into a slide door, or at least removable, and the whole trap made detachable from the building or window. The trap is designed to remain on the window at all times when not needed off, yet when removed there is still the point of exit above the window — the same principle now in use all over the country in honey-house windows. The trap will act as a fly-trap, and catch any insect passing out that can not pass the meshes of the screen.

#### REMOVING SECTION HONEY.

In taking off sections, the times that they can not be removed without the bees breaking the cappings are *very* few. Much depends on the manner in which it is done. I have had so very little trouble of this kind that I never stop to consider the question, though I know there is sometimes danger by careless work. Aside from robbers there is never any likelihood of the cappings being marred if there is honey being gathered, or if there be plenty of open cells within easy reach. I have many, many times removed supers that were solid sealed, and no caps disturbed, when no honey was coming in.

Let me tell you how to have the bees bite the cappings, then tell how to prevent it. Just go to the hive and work about it carelessly for five or ten minutes. Get the bees alarmed by a *little* smoke, and yet let them remain in the super. Take plenty of time to get the super off, and perhaps look around awhile or talk to some one who may be about. In short, go about it in a leisurely, careless manner, and if there is not open honey in the super, and sometimes when there is, you will get some cappings cut that the bees may load their sacs.

Here is the other way: Go with your smoker in good trim, start the cover, and, before the bees know what is up, shoot smoke *over* the sections. Keep things moving; and as the cover is clear removed from the super, and the bees starting down, *follow* them with the smoke and *keep them going*. Do not smoke ahead of them, and do not smoke too much at one place, but smoke all parts of the super, turning the smoker at various angles to hit all corners. Just as soon as the bees are well down in the super, *at once* remove it from the hive; and if your yard is nicely grassed, swipe the bottom of the super on the grass to brush off the adhering bees, or brush them off with a big grass or other brush, then set the super on end in the yard or remove at once to the house and set it before the window. In this operation the bees have not had time to dig open cells of honey, but rush around to get away, and those that go into the house on the honey will soon make for the window. It is possible a little damage may sometimes be done; though if honey be removed when it should be there is almost no trouble to speak of. I have practiced this at all times when bees could fly, and I think not one super in 100 is damaged.

#### REMOVING EXTRACTED HONEY.

Extracted honey I remove in the same way as sections, though it is more difficult to get the bees out of deep combs than out of sections; hence more bees are carried into the house. Suppose I am at the home yard, and want to extract, say, 500 or 1000 pounds. I go to the yard and remove the extras, not stopping to handle frames singly or brush bees off, putting

on another chamber in the place of the one removed, or not, as the case requires. When I carry the honey in, it is set near a window so as to leave the supers as open and airy as I can; and by the time I am ready to extract, the bees are out sufficiently.

Those bees that pass out are, of course, trapped. It would not be necessary to trap them; but the young that do not know their home will congregate on the window or house, and stay there, so I just trap all and carry them to the yard and liberate them there. If one wants to get those young bees in some certain hive to strengthen it, just lay the open trap on or near the hive they are wanted in; and while the most of the young will go there, the older will mostly go to their respective homes. Should the bees all be from an out-apiary, they can be hived where wanted, and will all stay there, for they are in a "strange land."

Hive-escapes I have not used very extensively; but smoking and brushing I have practiced largely, and the window method in a wholesale way. The escape no doubt has its place; but for large and out apiaries they will not do the work rapidly enough. My experience had taught me that I could rapidly free supers of bees in the open air and in the house, and that is why, a few years ago, I raised the question of improvement in escapes. Since then the matter has been discussed over and over; new forms of escapes have been brought out, yet it remains a fact that the question is *not* solved. My opinion is that it will not be solved by any method that leaves the super and the colony in a manner connected so that communication can be had, or that has a small outlet. Either of those factors will defeat the purpose. The super bees must be *lost from home*; and when the excitement is on they must not be hampered in their going.

[M. H. Mendleson, one of the most extensive bee-keepers in the world; J. F. McIntyre, another big honey producer, besides a score of others who raise honey by the ton and carload, think the hive-escape is a great success, indispensable, etc. It does not seem to me that the hive-escape problem is an unsolved problem in view of the opinions of such bee-keepers. Your instructions on how to and how not to cause bees to uncup honey in removing the same are excellent.—ED.]

## QUEEN-CELLS BY WHOLESALE.

NEW VS. OLD METHOD.

By H. L. Jones.

*Friend Root:*—Under separate cover I am forwarding you photos illustrating results achieved by the "new-fangled plan" of queen-raising that you wrote unfavorably of in GLEANINGS, July 1 and Aug. 1, 1895. I felt sure that some of your leading breeders would take exceptions

to your evident retrogression in going back to the "good old-fashioned way;" but if silence gives consent they must all indorse what you have said, which is indeed quite incomprehensible to me unless conditions for queen-rearing are not identical in our respective countries.

Your first objection, that the cell-cups are too expensive to make, is soon dispensed with, since there is no necessity for making the cups, as a strip of drone comb, which can be prepared and attached in a couple of minutes, is preferable. I have not made a cell-cup for years, but have raised thousands of queens on the drone-comb principle, as per Fig. 1. In the lower frame you will notice 17 fine large cells completed out of 19 furnished; in the center frame, 17 out of 18 have been accepted; while in the top frame all the cells are in a fair way toward success. Could you, by the "good old-fashioned method," average the same number of fine *available* cells?

One big advantage of the "new-fangled plan" is that you know that all queens are started from young larvæ, and will, therefore, be fully developed. You can also tell to within a few hours when the queens will hatch, if you have been careful to utilize larvæ of only the right age, and experience will soon teach you this. By the method you follow, of allowing the bees to build their own cells as they wish in colonies from which you have removed breeders, the cells must, to make a sure thing of it, be cut out on the tenth day, and will then continue to hatch up to the sixteenth, instead of the lot in about 11½ days, and you can figure out what a vast difference in the net results this variation in time must make where over 1000 per annum are raised. Then, again, these drone-cell cups, by being built all together in one compact cluster, require fewer bees to maintain the requisite temperature; the cells are not joined together so that they can not be separated without destroying one or more cells, and there is no mutilation of brood-combs.

Another good feature about these cells is the ease with which they all fit into the West cell-protectors, just as if they were built to order; and I may mention that I would just as soon think of producing extracted honey with an old one-frame honey-slinger as to raise queens in quantity without the aid of cell-protectors and cages. I give a ripe cell in one of these cages at the same time that I remove the reigning queen; but when sending off young queens that have been laying only a few days I usually give a virgin queen from one to three days old, liberating her right on the combs at the same time, and have very few destroyed. Look at the lower row of cells in Fig. 1, which are within 24 hours of hatching, and you will notice that they are so much surrounded with comb that only the points of the cells are visible; and I find that, when used without protectors, they are less liable to be torn down than the ordina-

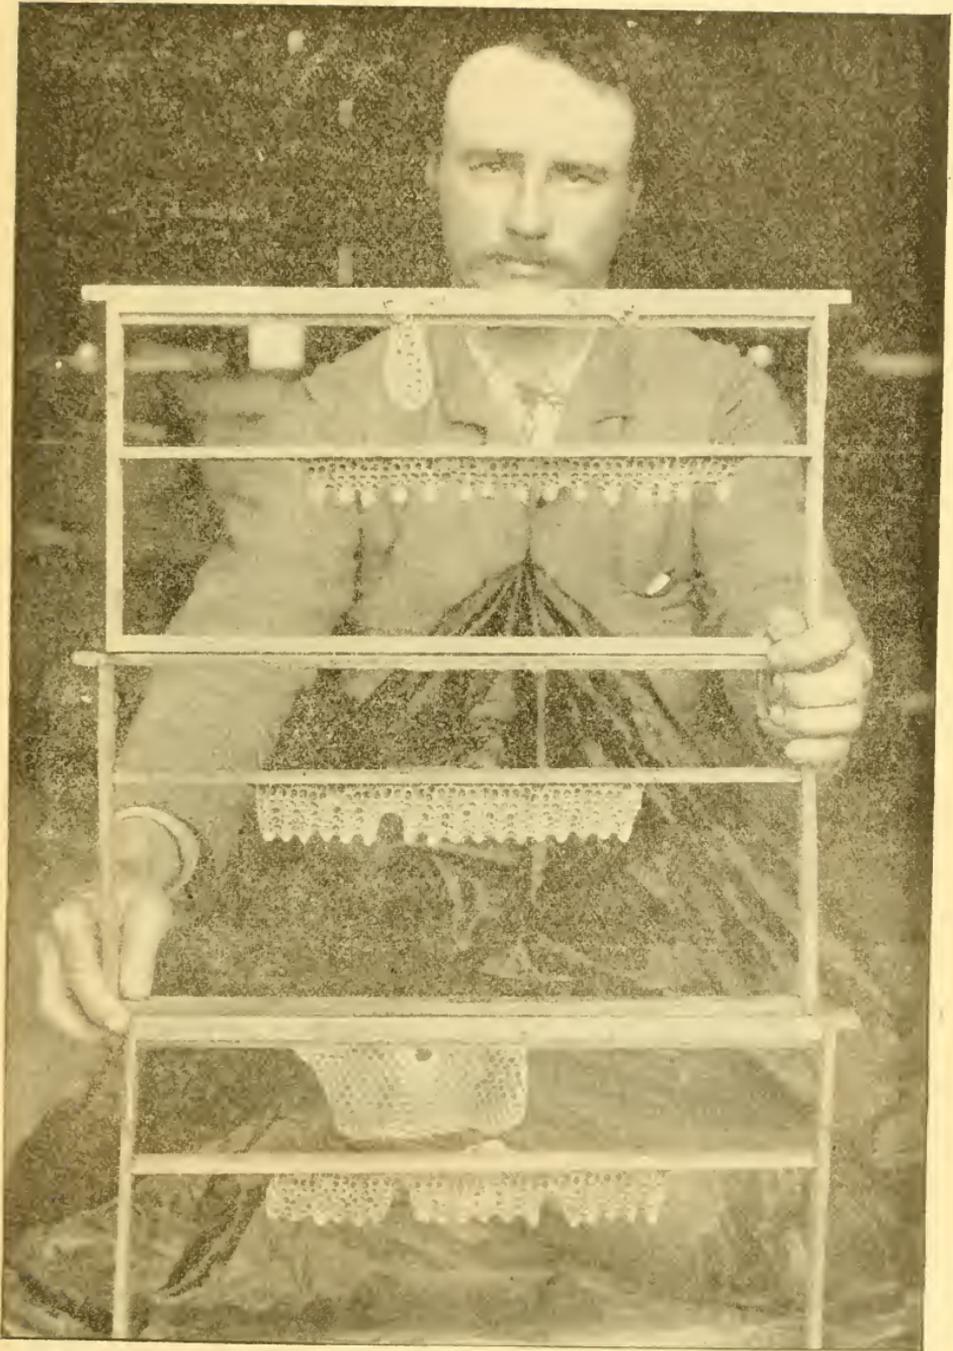

FIG. 1.—QUEEN-CELLS FROM DRONE-COMBS.

ry cells, as the thick incrustation of comb protects them. In removing these cells from the bar I place my queen-cell knife on the hot barrel of the smoker for a few seconds, and then cut off the whole row of cells as easily as cutting butter; the warm knife is then slipped between each cell, dividing them ready for the cages. I can assure you that it is a pleasure to handle these cells after those built hap-hazard

have bright cloudless days, and the increased warmth thus generated induces the bees to breed more rapidly, and I thus manage to secure thousands of fine drones much earlier than I otherwise should. When the weather becomes warmer, and the strength of the colony will admit of it, the glass is dispensed with. A zinc honey-board is placed on, and the bees induced to work in the upper story, and are then devot-

FIG. 2.—INSERTING THE LARVÆ.

on the combs. I don't know whether you have ever tried this drone-cell plan; but in any case I will describe briefly the *modus operandi*.

Toward the end of winter I select several of my finest colonies as drone-producers, and, after removing the lids, place an empty super on each, and then cover the frames with good thick cushions stuffed with cotton, and then on top of each super I lay a sheet of glass. We usually

ed to completing cells as per photo. Sometimes I place the prepared cells at once into these upper stories, but usually place them in a strong queenless colony for a couple of days before placing them in the upper story, by which method very few cells will be refused, and results identical with those shown in the photo will be achieved.

To prepare these cells I cut off a row of drone-

cells, and then cut them down to about  $\frac{1}{4}$  inch in depth, after which I attach them to the bar with melted wax. A little royal jelly is then placed in each cell nicely, at the bottom. Next I obtain a frame containing newly hatched larvae from one of my choice breeders, and then, seating myself in a chair in front of a strong light, I place a sheet of paper on my knees, and on this lay the frame of brood, and transfer the larvae as per Fig. 2. The center bar being secured by one nail only at each end, is grasped as shown, and can be moved to any angle so as to strike the light. The little stick used for transferring the larvae is simply a piece of section stuff about  $2\frac{1}{2}$  inches long, one end being about  $\frac{1}{8}$  inch wide, and the other about  $\frac{1}{16}$ , and as fine as can be sharpened, with the point bent just a little so as to slip under a larva. The larger end of the stick is used for placing the royal jelly in the cells, and occasionally for bruising down a cell so as to get conveniently at the larva. Fig. 2 shows the act of placing a larva in a cell; and the supporting-bar, being wider than the cells, acts as a rest to steady the hand, so that the larva can be placed in the bottom of the cell very gently. I can't, for the life of me, imagine how you can raise more queens by the old-fashioned method.

Goodna, Queensland, Australia.

[The proof of the pudding is in the eating. The proof of your statements is shown in the half-tone plates herewith reproduced, and I am very glad to take back all I have said that could be in any way construed as reflecting on the new way of queen-rearing. If the results shown in Fig. 1 are what you secure on the average (and I have no reason to question it), then any queen-breeder who does not use your method, or one equally good—for instance the Doolittle, is not looking to the interest of his pocketbook. It was G. M. Doolittle who first made a success of having cells built in regular "rows on a stick." A good many have since made a success of his plan, although some of us did not succeed to our satisfaction. It was J. D. Foose, I believe, who first made a practical success of raising queen-cells from drone-cells. As I judge, you have simply followed out or elaborated his plan. One thing is certain, friend Jones: If you and Foose and Doolittle can get such results as these, then we old fogies who have not made a like success had better work and plan until success is achieved. You may be sure the plan outlined above will be fairly tested in our apiary; and if we do not succeed we shall keep on fussing until we do.—Ed.]

---

## BEE-CELLAR EXPERIENCE.

HOW TO CONSTRUCT A BEE-CELLAR.

By G. C. Greiner.

The severity of our winters in this mountainous section of Western New York makes wintering of bees on their summer stand in single-walled hives an uncertain affair. I find that a proper bee-cellar is a necessity if we expect to

be successful in the pursuit of bee-keeping. The cellar of which we give an illustration is the result of one complete rebuilding and several thorough overhauls, caused by faulty construction and mistakes at the beginning. We all make the common mistake of reporting our successes—are too apt to give the bright side of the picture, while we are very reticent about saying any thing regarding our failures. It would have a tendency to keep others from making the same mistakes if we would be a little more frank in reporting ours. For this reason I will mention a few points that made my bee-cellar the source of a great deal of work, and caused the loss of many colonies.

The cellar is dug lengthwise into a bank of such elevation that the 22 feet of length makes the front just level with the outside, and the back wall 7 feet high. The bank is perfectly dry ground. After the top soil is removed, perhaps  $1\frac{1}{2}$  or 2 feet, the soil is what we call hardpan—bluish clay mixed with gravel, and so hard that it requires an extra effort to penetrate it with any kind of tool. After the excavation had been completed there was no sign of any moisture, nor any indication that there ever would be any, and, in consequence thereof, the first and most serious mistake was made by not providing proper drainage in case it might be needed.

Inside of this excavation, about 15 in. from the bank walls, a frame of 2 x 4-inch scantling was erected, using the same for sills and plates, and setting the studding every 2 ft. all around. The inside was ceiled up with matched chestnut lumber; and as fast as this advanced, a loose stone wall was laid between this and the bank. The covering was twofold—2 x 6 joist, with the same ceiling on the under side for the lower one, and rafters with a tight layer of roof-boards, and about 15 inches of dirt on top of them for the upper one. The whole, when finished, had the appearance, very much, of one of our common potato-pits. The front was ceiled on both sides of the 2x4 studding, leaving a dead-air space of 4 inches between. An airtight partition, 4 feet from the front, divided the cellar into two apartments—an entry, or hall, and the cellar proper.

At the proper time, in the fall of 1886, I put 90 colonies into this cellar, and what was the result? All went well the fore part of winter. The temperature in the cellar remained about 46 degrees, and the bees seemed to be doing nicely. About the middle of January the weather changed; winter seemed to be broken, and a warm springlike spell took its place. This did not affect the cellar at first; but after the ground thawed out more and more, the bottom began to show signs of moisture, which increased from day to day at such a rate that, in a short time, the cellar bottom was flooded. The only way out of this dilemma was to dig a ditch

through under the doors into the open air, and let the water run off.

But this was not all. With the thaw we had rain, and soon the ceiling overhead became moist also. After a little, drops began to trickle down here and there. They came thicker and faster, until the bees were exposed to quite a respectable rain-shower. I had made the (second) mistake of considering the 15 inches of dirt covering as a rain-proof roof. As long as the ground was frozen it did very well; but when it was thawed out it was no roof at all. Under these extremely unfavorable conditions we could not expect bees to winter, and it was a wonder that any lived until spring.

Of the 90 colonies I put into the cellar in the fall, about half were dead in the spring, and most of the survivors were only fractions of colonies at that.

The succeeding fall I built a board and slate roof over the dirt. I imagined that all the water trouble was caused by the imperfect roof. This made the cellar water-proof from above, but it remained the same under foot. The first thaw we had that winter, water again made its appearance, and the cellar remained wet the rest of the winter. The loss of bees was about the same as the winter before—a half or over.

About this time I concluded that wintering bees at that rate did not pay, and decided to have a bee cellar if mechanical workmanship could produce one. The first move was to take the whole structure down and out of the way. A ditch was then dug next to the bank, a foot wide, commencing in the center of the back end, with one foot deep, gradually increasing each way to  $1\frac{1}{2}$  feet to the outside corners. As the bottom of the cellar had already a fall of 6 inches from rear to front, this gave the bottom of the ditch a fall of one foot to 26 ft. in length, and this fall was continued to the outlets of the ditch, about 3 rods from the cellar. The ditch was stoned up in the usual blind-ditch fashion—a throat, by laying round stones on each side, and flat ones to cover, and the remainder filled with small round ones just level full.

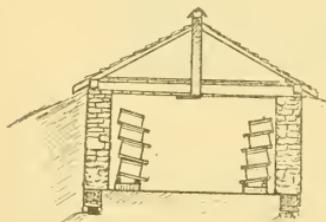

FIG. 1.

On this ditch a substantial 18-inch stone wall, 7 feet high, was laid, using first class mortar throughout, and giving the inside a thorough painting of waterlime. The wall, being 6 in.

thicker than the ditch is wide, lapped that much on to the solid cellar bottom, and, with the cement paint reaching well down and filling the bottom corner, shut off all possible passages from ditch to cellar, so that the structure is positively mouse and rat proof from that direction.

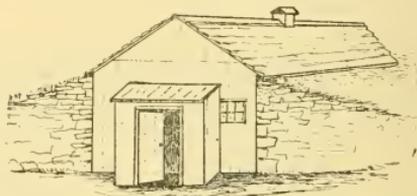

FIG. 2.

A frame of 6x8-inch timber, with 2x8-inch joists framed in at every 2 ft., rests on the wall. The joists are ceiled with matched lumber below, and covered with a double floor above, forming dead-air spaces all along between the joists. The impression received during school-days of early life, together with what has been written now and then in the different journals, on the subject of a dead-air space being a non-conductor of heat and cold, and consequently a safe protector against atmospheric changes, led me to the conclusion that my bee-cellar would be perfectly safe with this protection overhead. Besides, another dead-air space, formed by the roof, protects the former from coming in direct contact with the atmosphere.

From the first two winters' experience I am fully convinced that the dead-air-space theory is greatly overestimated. It is all right so far as it goes, but it does not go far enough. I made these observations:

Every thing seemed to be satisfactory until, with the lengthening days, colder weather set in, the mercury ranging for weeks in the neighborhood of zero, at times going as low as 15 or 16 degrees below. At this time the ceiling again began to show signs of moisture. The moisture gradually increased; drops formed here and there, and occasionally they could be heard to strike on the hives or cellar bottom as might happen. Although this was not a pleasing feature of a bee-cellar, no serious results followed. Bees wintered quite well; every colony that was put in in the fall answered to the roll-call in the spring.

The next winter brought nearly the same experience—not quite satisfactory, on account of the moisture overhead. I then tried chaff packing instead of the air-spaces. By opening the floor in the middle, all spaces between the joists were made accessible, and these I filled with oat chaff, using a tool something like a stable-scraper, to pack this filling as tight as possible. Since this change was made the ceil-

ing has remained perfectly-dry every winter, showing plainly that, for protection, a non-conducting material is more effectual than an air-space.

The ventilator shown is a wooden tube six inches square, with a four-foot elbow in the roof, and a slide to close it, if desired, on the lower end. While this provides an outlet, no provision is made for an inlet, and I hardly think this is necessary. The same current of air which escapes through the ventilator must be replaced by an equal current of outdoor air from somewhere; and that this circulation is going on all the time can be plainly seen by the constant escape of vapor when the weather is cold enough to condense the warmer air from the cellar and make it visible. Our so-called air-tight structures are by no means hermetically sealed. Doors do not shut air-tight; the matchings are a little defective here and there; the lumber itself may have small openings, cracks, or pinholes; the ditch may be the means of supplying a certain current, etc.; so that, take it all in all, a sufficient amount of air may find its way into the cellar to cause quite a circulation.

The illustration, Fig. 1, has also a storm-house attached to the cellar, which was built a few years ago. I did not deem it necessary for the comfort or better wintering of the bees, although it may be an additional protection; but I built it for my own benefit. I found that it required a considerable amount of work, every time I went into the cellar, to clear away the snow, frequently two or three feet deep, to let the door swing open. The stormhouse prevents all this trouble. The door swings in, and can be opened at any time, snow or no snow. In entering, of course care must be taken not to let any snow tumble in, as this would interfere with shutting the door.

Naples, N. Y.

[Although this article is a little out of season, recent experiences will be fresh upon the mind, and so I have thought best to give it now rather than in the fall.—ED.]

#### SWEET-CLOVER SYMPOSIUM.

Will Horses and Cattle and Other Stock Eat Sweet Clover if They Have a Chance to Get at it?

#### NAMING SWEET CLOVER.

*Bro. Root*.—Permit me to suggest that you do not be in a hurry to change your views as to the classification of sweet clover given by Prof. Gray. There is just as good ground, and I think better, for accepting his classification as that given by Mr. Esenhower. You will not need to examine any more "classical" work than the Edinburgh edition, of 1878, of Chambers' Encyclopedia, to find the classification as given by him; for it appears there in almost

the same language in which it is given in GLEANINGS. This is an English classification, and I am at a loss to know why it is so made. The yellow melilot (*M. officinalis*) is so called from its early use in medicine; but as it is the species which runs wild in Europe, and is common everywhere, there is more reason for calling it *M. vulgaris*, or common, as this is what the Latin, *vulgaris*, means. *M. alba*, as given by Gray, is after the old and long-accepted classification of Lamarck, and simply means, as every one knows who has any knowledge of the Latin, *white* melilot; and as it is not common, except in a few localities in Europe, this seems the most fitting name for this species, in that country at least. There might be some ground for changing the name to *vulgaris* in the United States; but as the species has the special characteristic of a white flower, as well as being common, it would seem a needless change. The name *leucantha*, which is also given in the English classification, is a Greek word which means the same as the Latin *alba*, white; so that this is practically the same classification which Prof. Gray adopted. The tendency to name the species according to the color of the flower is further seen in *M. corymbosa*, as this simply means *blue* melilot. If it had not been for the supposed medicinal qualities of the yellow sweet clover, it would no doubt have been called *M. gilva*, taking the specific name from its color, the same as in the other two species. I am very much inclined to agree with Mr. Jones' idea, that "bokhara clover" is the same as *M. alba*, and that the name, "bokhara," has been wrongly applied to it. As I suggested in another article, I think the name bokhara more correctly belongs to a species of alfalfa.

*M. arborea* simply means "tree melilot," and I can well understand why the tree-like form and rank-growing *M. alba* should come to be called "tree clover," when compared with the low-branching and finer-strawed yellow sweet clover.

I think perhaps the other species mentioned by Chambers, which was found mostly on the islands of the Mediterranean Sea, and along the coast, is simply a variety of one of the species named above.

If my position is correct, you are not likely to be able to get seeds of any more species than you now have. My presumption is that we shall be entirely safe to trust to the classification given in the new edition of Gray's Garden and Field Botany, as revised by Prof. Bailey. I, for one, am willing to take my chances in agreeing with these two eminent American botanists as against the writer of the article in Chambers' Encyclopedia, or any other so-called "classical" work. EMERSON T. ABBOTT.

St. Joseph, Mo., Apr. 17.

[In regard to the tree sweet clover, some-

body in Florida or Texas wrote some years ago that "away down south" sweet clover makes a hard-wood tree, and stands over winter; and they seemed to think it was the same sweet clover we have here in the North. Who can enlighten us?—Ed.]

STILL MORE ABOUT OUR VARIOUS SWEET CLOVERS.

Mr. Root:—You express the belief that there is no difference between the plants of yellow and white sweet clover. On the following page (266) of GLEANINGS you give a letter from Mr. Esenhower, which I found interesting, though I shall be obliged to disagree with the gentleman, or his authority, in regard to some points.

He names but a few varieties of sweet clover. I can add a little to his list, though I can not complete it, for there are at least ten known species—some authorities say twenty—many of which have never yet been classified. He says: "Gray's Manual does not thus classify melilotus," while you say you have always made Gray your standard, etc.

Gray is all right in the main, when you keep within his range; beyond that he counts for nothing. His range ends at the 100th meridian, where he is met by Prof. Coulter, with his "Manual of the Rocky Mountains." How, then, can Prof. Gray be expected to classify plants belonging strictly to the Old World? There are mistakes in his manual, it is true; but they are those of omission rather than commission. Strictly speaking, none of the sweet clovers are natives of the United States; and up to the present, *M. officinalis* and *M. vulgaris* (or *alba*) are the only two that have ever taken out papers of naturalization, and become bona-fide citizens. You say you have *M. carulea* (the blue-flowered melilot). I was intending to send to Europe for seed of that variety; but if you have it I shall not cross the ocean to obtain it.

Let me call attention to a somewhat curious fact. English botanists do not refer to melilot as *sweet* clover, but only as melilot, or melilot clover—meaning honey clover, the adjective *sweet* being of pure American origin.

I am aware that authorities often differ on many subjects, all of which is very confusing to the earnest seeker after truth; and the best thing left us is to discriminate as far as possible between them. I have a good many authors on botany. I have encyclopedias, and various works of reference. How many Mr. Esenhower may have I don't know; but certainly his and mine don't seem to agree in all things. All mine do agree in one thing; viz., that *M. alba* or *vulgaris* are both correct as applied to the white-flowered variety of sweet clover; also that bokhara clover and *M. alba* are one; while the two varieties he mentions, *M. arborea* and *M. massimensis*, are entirely ignored by any work I have.

The word *massimensis*, taken as it stands, would mean, as translated from the Latin, a monthly bloomer. All the melilots are derived from two Greek words—*meli*, honey, and *lotus*, meaning the quantity of honey it contains.

Permit me now to quote from the New Encyclopædic Dictionary, page 3087, constituting what I regard as a true botanical classification of the melilot.

"Melilot, a genus of papilionaceous plants, sub-tribe *Trifoliæ*. Leaves trifoliate, the flowers in long racemes; calyx, five-toothed; petals distinct, deciduous; keck, obtuse; legume, one or few seeded indehiscent, longer than the calyx. It is found in the warmer parts of the Old World; known species, ten. Two are wild in Britain—*M. officinalis* and *M. alba*. A third, *M. arvensis*, is an escape. A decoction of the first is emollient, and sometimes used on the Continent in lotions and enemas. The second produces swelling in the belly of cattle which graze upon it.

"The flowers of *M. carulea* are used to give the peculiar odor and flavor to Schabzieger cheese made in Switzerland, and more particularly in Glarus; the plant is said to be a styptic.

"The seed of *M. parviflora* is useful in diarrhea, especially of infants; the plant is esteemed in India as forming good pasture for milch cattle."

*M. officinalis* is the common melilot. *M. arvensis* is the field melilot, and *M. parviflora* the many-flowered melilot. *M. officinalis* (yellow flower) is the only one of the list officially recognized by the chemists as of great medicinal value. The word common, when used in a botanical sense, becomes the distinguishing name of some the best-known varieties of plants.

A word now in regard to the name bokhara. No reason seems to be assigned for the word. If, as you and others assert, it means hulled seed of *M. alba*, why not with equal reason call hulled seed of any of the clovers bokhara? In my opinion it is a local term only, and about as misleading and incorrect as the name hearts-ease when applied to a polygonum. These things serve but one purpose, and that a bad one—to befog the average reader.

Again, Mr. Root, you ask, "Why, if the yellow and white sweet clovers are not the same, do we find stalks of the yellow growing among the white?" Either of several agencies may have effected this. First, by the bees carrying pollen; second, by the wind; third, by a few stray seeds becoming mixed with a bulk of the white. Seed mixtures will take place sometimes, careful as we may try to be.

MRS. L. E. R. LAMBRIGGER.

Niobrara, Neb.

[In regard to the term "bokhara," it is used in various catalogs, and by wholesale seedsmen. In a circular just at hand from Johnson &

Stokes, of Philadelphia, among their grass seeds and clovers they designate it as follows: "Bokhara clover (*Melilotus leucantha*)." Now, this seed that they name in this way is always hulled. When father Langstroth first called my attention to it as a honey plant he called it *Melilotus leucantha*.

If we quote one of the names, a good many people will not know what it is; therefore we have mentioned both names, just as we do when we say "basswood, or linden trees;" and even then a good many of our customers will say, "Send me half a dozen each of basswood and linden trees," thinking there are two kinds. If somebody could invent a way of getting rid of so many names for one and the same thing, it would be a wonderful help all along the line.—Ed.]

#### SWEET CLOVER, WHITE AND YELLOW—ARE THEY THE SAME?

On page 255, in speaking of yellow and white sweet clover, you say, "My experience is that the color of the blossoms indicates no difference at all in the plant." As our little girl would say, you make a "mistaken" if you think that it is one and the same plant. On dumping-ground in Peoria, Ill., I have seen a sheet of gold on this plant a full month before a blossom appeared upon the white. The leaves and stalks are finer and more abundant, making better hay, and curing more readily, and not so woody as the white. The white variety grows taller than the yellow.

On my return from St. Andrews Bay, Fla., Apr. 13, every colony of bees answered to roll-call, and most of them were populous. They are busy carrying water to-day.

A good crop of honey has been secured in that part of Florida, from the ti-ti bloom. The country is fast recovering from the disastrous freeze of two years ago. A few orange-trees bloomed and set fruit. MRS. L. HARRISON.

Peoria, Ill., Apr. 19.

#### MORE ABOUT SWEET CLOVER, WHITE AND YELLOW, ETC.

I do not think white and yellow sweet clover are identical, judging from the manner it grows here. Although its manner of growth is similar, the yellow is considered to be not as good for producing nectar as the white. Here in Albany Co. we have both kinds, although we have the white in greater profusion. I notice each kind generally isolated; that is, there will be patches of each in different places, showing that each perpetuates its own kind. Where they grow near each other the seeds may have been mixed, which would account for an occasional stem of yellow growing among the white, as remarked on page 255.

Is sweet clover of value, both green and dry, as feed for stock? Stock refuse to eat it green when growing in pasture fields. When pasture fails they will eat it green. Cut and cured before stalks get woody, say when blossom-buds appear, stock will eat it in winter, and it makes

excellent fodder. Sweet clover will perpetuate only where no cultivation is done. Plowed under before it ripens its seed, it is as easily eradicated as any other clover.

So. Bethlehem, N. Y. G. J. FLANSBURGH.

#### THE TWO KINDS OF SWEET CLOVER—YELLOW AND WHITE.

I know of a kind growing on the streets of Beatrice, Neb., that is distinctly a yellow, and does not grow so rank or tall as the white variety, which also grows along the roadside around the same town. This yellow variety is much earlier to bloom, but you can not tell one from the other before the bloom starts to open. I am told that this yellow kind was sown by a German bee-keeper several years ago, and it is believed he either brought or had them sent from Europe for that purpose.

Steinauer, Neb. CHAS. J. HARRIS.

#### SWEET CLOVER FOR STOCK.

In regard to sweet clover, I find that stock eat it as readily as alfalfa, and I have noticed my horses leave their corn to bite a choice tid-bit that happened in their prairie hay. I also notice that there is no sweet clover growing in the pastures, but it is coming in rapidly along the roads and hay land. I think persons sowing it should put it in a field by itself rather than along the road.

B. G. SOWLE.

Kearney, Neb., Apr. 10.

#### IN KANSAS, STOCK EAT RIGHT DOWN INTO THE GROUND TO GET IT.

□ Is it not very strange that some people's stock will not eat sweet clover, green or dried? My horses and cattle are running on a piece this early in April, and they eat right into the ground to get it, and yet they are well fed; but stock that have never been used to it will not eat it at first sight.

JOSEPH SHAW.

□ Strong City, Kan., Apr. 10.

#### IN NEBRASKA THEY LEARN TO EAT IT DURING A DRY YEAR.

□ Out in Western Iowa the lanes were full of sweet clover until we had a very dry year; and the stock, in driving them to pasture, got to eating it, and seemed to like it as well as any thing they can get since. E. W. MOREHOUSE.

Sutherland, Nebr., Apr. 7.

#### CASES, SECTIONS, AND BEE-RANGE.

##### EXTRACTED-HONEY CASES.

By W. A. H. Gilstrap.

I am interested in the article on shipping honey, p. 232. I don't know how it is done, but somehow the Southern Pacific can smash cases holding two new 60-lb. cans of extracted honey, when well-nailed coal-oil cases are used. With a partition between the cans I have never

known an accident. A firm in Boston once wrote me that it was unsafe to ship honey without partition, and my experience corroborates the statement. I believe the damage here is done by cars bumping together. Care in packing, shipping, and selling is just as important as in producing. We should get the cheapest package possible, to be sure it will entirely accomplish the purpose for which it is intended.

#### THIN SECTIONS.

Nothing should be considered settled until it is settled right. I have heard the integrity of GLEANINGS seriously questioned when edited by its founder because of its persistently claiming, as an advantage of light-weight sections, that they would be bought by many on account of their cheapness. GLEANINGS is evidently honest about it, but is certainly mistaken, at least in this country.

When I see comb honey in a store I generally ask the price. Next I ask the weight of a section. The salesman calls it a "pound," or "about a pound." If I know it is light I tell him so. If he is honest he weighs some; if he knows it is light he prefers evading the point, or changing the subject. I have never found the light-weight sections selling for less price than full-weight, in a single case. Who has? Ordinary customers see a  $4\frac{1}{4} \times 4\frac{1}{4}$  section, and consider it "a pound," "about a pound," or "nearly a pound," and far the most take the former position. If we use thin sections, let us change their rim measure.

J. F. Flory, of Lemoore, Cal., who has probably changed his hives, sections, frames, etc., more than any other man west of New York, has been using a  $4\frac{1}{4} \times 5\frac{1}{2} \times 1\frac{1}{2}$  section, without separators, for three or four years, and says it weighs a pound. Some call it Flory's big section, and it does look big. About half a dozen men who run the smaller part of their bees to comb honey use it. You can show one to a customer, and call it a pound, with a clear conscience; he is pleased with it, and buys sooner than he will with a  $4\frac{1}{4} \times 4\frac{1}{4}$  of the same weight. I use the standard, honest, 16-ounce avoirdupoise-pound section because it is more convenient, and shippers would rather buy it.

Mr. Flory claims that bees will build a comb from a "starter," fill with honey, and seal it, before they will fill and seal combs on each side of it, such combs to be placed  $1\frac{1}{2}$  inches apart. From this he argues in favor of thin sections being built sooner, as well as looking better. The experiment is worth trying.

#### BEE-RANGE.

On page 240 it seems Borodino bees do profitable work from four to eight miles. I am thoroughly convinced that bees owned by C. M. Davis, of Selma, Cal., gathered considerable camphor-weed honey, which grew within three miles of my bees, while my bees could not

nearly make a living. The ground intervening was rough, but no great heights or winds forbade the free passage of bees. If that was an exceptional case we should all know it, as it seems to me a very important question, how far bees can work to best advantage.

Caruthers, Cal., Apr. 20.

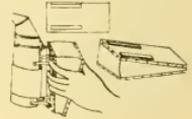

#### CLEATS ON BELLOWS TO BEE-SMOKERS.

PRACTICAL SUGGESTION FROM A BEE-KEEPER OF A THOUSAND COLONIES.

By W. L. Coggsball.

I sometimes know a good thing when I see it. Here is one of the best little things, that I discovered some time ago, and it costs only a little time.

Take one side of a section (or a honey-box), and with a knife cut it into four equal parts lengthwise, and, with some very small tacks, tack them on the edge of your smokers where you take hold, like this, on both sides, and then see how much easier you can handle the smoker and not drop it. The action of the hand in opening and shutting

a heavy smoker renders you liable to drop it.

The best fuel that I ever used for a smoker is burlap phosphate-sacks, or gum bags. They can be had very cheaply at junk-shops. I roll them up, not too tightly nor too loosely, so they fit the smoker. I light one end, and lay a stick by the side of the burlap, when I put it into the smoker for draft.

A smoker filled in that way will last three or four hours, with light work at bees. There are no sparks, and no danger of fire.

Bees wintered well, 2 per cent loss. My honey is nearly all closed out—78,000 lbs. We shall have about 1000 colonies this season.

I think it would be to your advantage to call on me next August. I extend you an invitation.

West Groton, N. Y., March 26.

[One of our men, a couple of years ago, in the apiary, I noticed, was using cleats on his smoker-bellows; and on trying them I noticed that they afforded a much better "grip" for the hand. I am not sure but it would be a good plan to put them on all the bellows of our higher-priced smokers; but instead of using cleats we would groove the boards on each side so as to leave a molded edge that would look better, and feel more comfortable to the fingers. We will have a lot made soon, and later on send a smoker having this feature to Mr. Coggsball, "with our compliments." In the mean time those who already have the plain bellows-board can very easily fix them in the manner suggested.]

It was Mr. Crane, of smoker fame, who first suggested to us a smoker fuel similar to the gum sacks. He uses, or did use, old propolized cloths or quilts that had been used over the frames. We tried some of this, and found it to be an excellent fuel.

Thanks for your invitation. I have concluded to accept it, and at the same time call upon other bee-keepers of your State. It was seven years ago that I visited bee-keepers of your State, and at your kindly hint I am in hopes to repeat that trip in part.—A. I. R.]

### APIS DORSATA.

WHY THE CONVENTION DID NOT INDORSE THE PROJECT TO GET THEM.

By W. C. Frazier.

This question has been asked on an average of once every two weeks since the convention; and while many good reasons have been given, still the inquirers do not seem to be satisfied, and think there is some selfish motive behind it that prevented the indorsement. *Nothing of the kind existed.* Now, I am something of a bee-importer myself, and am aware that if *Apis dorsata* would prove only half as good as it has been painted, the man who succeeds in introducing it could carve his name above that of Dzierzon, Berlepsch, or our own father Langstroth. He would not only be respected and honored, but he might make a snug little fortune out of it. Now, I, or half a dozen others whom I could mention, who understand the business, and have had some experience in importing, could lay down at our own apiaries 12 of these queens at a cost not exceeding one hundred dollars for the dozen; and the man who furnished them, the one who gave them a rest in Europe, before crossing the Atlantic, and the express companies that handled them, would all get a satisfactory equivalent for their labor and care.

Now, what's to hinder some one sending for a consignment? It is not the want of means, as that could be secured, even if the one wanting to send did not have the money himself. It's simply the lack of queens. This bee has been known as the giant bee of India or Ceylon, or somewhere else. Now, before the government or any one else undertakes to send for it, would it not be well to locate it? India or Ceylon is rather indefinite. I might say there is gold in South Africa or in Alaska, or even in the United States; but it would require considerable panning to locate it on such meager information. There are Englishmen all over India; and if this race of bees could be domesticated it seems rather strange that some of them have not tried their hand at it. Englishmen usually have an eye to what will pay them, quite as much as we Americans.

These matters were talked over to some extent by a few of us at Lincoln; and the way the thing now stands, I should not feel like investing any of my money in the uncertain venture of trying to get them, and I don't think at present the government could be induced to with the meager information at hand; and

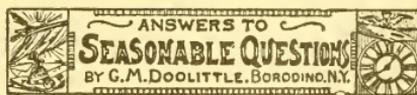

should any one *anywhere* succeed in domesticating them, and have queens to dispose of, there would be no necessity for the government to step in, as some of us would have an order in for them before he could get his papers and his trunk packed.

If any one will take the trouble to look over the reported honey yields given at the Lincoln convention by those present, many receiving from 100 to 450 lbs. per colony, he will readily see why *Apis dorsata* did not create more enthusiasm. *Sensible men let well enough alone.* Most people would be satisfied with such bees, and would only want a few more of them. At some future convention, where the honey yield has been a failure, they will perhaps highly indorse them.

Now, lest I be misunderstood I want to say that, personally, I have not the slightest objection to the government's sending after them; and there never was a time when there was a Secretary of Agriculture who would give such a proposition more attention than we have at present, and it would not be necessary to explain to him that there is such a pursuit as bee-keeping. But if such a petition is presented, if you want to succeed, get things in shape and locate the bees first.

Atlantic, Ia.

[This was written before the editorial appeared on page 339 in May 1st issue. I had not seen his manuscript when I wrote the editorial in question. It will be seen that our thoughts run much in the same line.—Ed.]

#### MULTIPLICATION OF COLONIES.

*Question.*—I have purchased some bees, and wish to increase them. Is there any way of multiplying colonies, except by swarming, as the bees conduct this, for increase? I must be from home from 8 A. M. to 4 P. M. each day, except Sundays; and if there were any way to multiply my colonies except by natural swarming it would be much more convenient for me. Please tell us something about this in your department in GLEANINGS.

*Answer.*—The multiplication of colonies of bees, outside of natural swarming, is something that is as old as the most ancient of the things about bee-keeping. In the latter part of the seventeenth century, Swammerdam told of a bee-keeper who knew the art of producing queen-bees at pleasure, and who secured four times as many colonies annually as were usually obtained; and in 1762 Grewell gave directions for making artificial swarms and dividing colonies. Others announced previously to the nineteenth century, that bees were able to raise

a queen from worker brood, which fact was then known to only a few. But as the hives then in use were ill adapted to artificial increase; and as many facts having an important bearing in the matter were then unknown, the practice seems to have met with little success. When Huber partially developed the movable-comb system, and made important discoveries in the physiology of the bee, a greater success in artificial swarming was attained; still, it was seldom practiced successfully, even then, except by the most expert and well-informed apiarists. It would be well for the readers to consult our books on bee culture before undertaking artificial increase to any great extent; for in the most of them this subject is discussed quite extensively, and at greater length than would come in the space allotted to this department.

Artificial swarming is based on the following facts: First, a queen and some workers, 500 or more, constitute a swarm or colony of bees, capable of carrying on all the labors of the hive. Necessity for drones comes only in case of young unfertile queens. Second, worker bees, without a queen, can rear a queen if they are furnished with a comb containing eggs or larvae under three days old. Third, a part of the bees of any colony, unless too small, may be taken from the hive, with or without the queen, without disorganizing the others. Fourth, a part or all of the comb may be taken, with its contents, from a colony of bees without destroying them, as they will immediately go to work to replace it, if fed, when honey is not coming from the fields. Fifth, queens can be reared in any desirable number by taking the queen away from any populous colony or colonies, according to the number desired; and, when nearly mature, they can be given to the queenless part of any division made.

These facts, while they form the basis for artificial swarming, are subject to many qualifying conditions; and a knowledge of them alone would not enable a novice to multiply his colonies to the best advantage. But a thorough knowledge of the economy of the hive, and of the habits and peculiarities of its inmates, coupled with the above, will, with a person of ordinary ability, give success in proportion to the energy and perseverance of the person undertaking the matter.

The greatest and most damaging error that nearly all beginners fall into is an inclination to overdo the matter. After getting started they generally "swarm" their bees to death, as the multiplying seems so easy during the honey-flow, and they find themselves in possession of a great number of weak colonies, with few stores, when winter arrives, only to drag out a miserable existence for a little while, or die of spring dwindling before settled warm weather arrives.

Another error, in the average locality, is almost as bad as the above, which is, putting off the multiplying of colonies till too late in the season. No definite time can be given, as much depends upon the season and locality; but it is well to do it as early as you can. In the Northern States it can generally be done with safety from the 10th to the 25th of June, and in the Southern States from one to two months earlier, according to latitude. The only safe guide is the condition of the colonies to be operated on. The hives should be well filled with brood and bees, and honey coming in from the fields, to have the proper conditions exist. This will often occur from two weeks to a month before natural swarming would take place. The parent colony, as also a swarm made at that time, will, by the time when honey becomes abundant, be filled with comb and brood, and ready to take advantage of the honey harvest by storing a nice surplus; while, if left till later, each part would have all this work to do at the most important period of the year. Two or three weeks, thus saved, frequently amounts to the difference between an excellent yield of honey and not enough to pay expenses. Many colonies of bees will not come into proper condition for dividing when the more advanced are ripe for the operation, on account of all not coming through the winter in equally good condition, having old or failing queens, etc. Such colonies may be united with others, after destroying old queens; or if the queen is vigorous, a frame of hatching brood may be given from one of the most prosperous colonies, as soon as the weather becomes warm enough so there is no danger of the brood perishing on account of too few bees to care for it properly. Having the colonies in proper condition, it is well to decide whether a great increase of bees is desired or a good crop of honey. Both can not be secured at the same time. If we are satisfied with doubling our colonies, and do that in time, a fairly good yield of honey can be expected in most localities; but a greater increase can not be ventured upon without a great sacrifice of honey, often to the exclusion of the whole crop. As I have given, in a recent issue of GLEANINGS, different plans for dividing colonies, I will not attempt to touch on that matter here. This reply has been written from a comb-honey standpoint.

HONEY-JUMBLES WITHOUT SUGAR OR MOLASSES.

I will give you a recipe for making honey-cookies or cake, that does not need sugar or syrup. It is one of my own devising. I kept

on trying for over four years, ever since we went into the bee business, and I think I have found one that can be rolled on, either for cake or cookies. You can try it, and if it works all right with you, let your neighbors try it. You can make it richer if you like by using clabbered cream instead of buttermilk. Bake in a rather slow oven, as it burns very easily. I hope it will work as well with you as it did with me. To make the cookies, use a little more flour, so that they will roll out well without sticking to the board. Any kind of flavoring will do. I use ground orange-peel mixed soft. It makes a very nice ginger bread.

Terminous, Cal.

MARIA FRASER.

[It seems the honey-jumble recipes, and, in fact, Dr. Miller's leaflet on the food value of honey, came out when I was in Arizona; and after what the leaflet has to say of the advantages honey has over sugar from a sanitary point of view, I was somewhat surprised to see Dr. Miller—yes, Dr. Miller *himself*—(who wrote the leaflet) advising us to put *sugar* and *molasses* in *honey-jumbles*! Well, our good friend who writes the above has demonstrated, at least to the satisfaction of all Rootville, that honey-jumbles, made entirely of *honey*, are away ahead of any made with sugar or cane molasses, and, in fact, I might have known they would be. This honey-cake is not only the nicest cake I ever ate, but I can eat it without any trouble, which is more than I can say for some of the recipes given last winter, where they use not only cane sugar, but cheap molasses, and, worst of all, *lard*. Just think of it—recommending *lard* for *honey-jumbles*! yes, and nobody even protested.—A. I. R.]

#### THE HOWELL HONEY-CAKE (IT IS A HARD CAKE).

Take 6 lbs. flour, 3 lbs. honey,  $1\frac{1}{2}$  lbs. sugar,  $1\frac{1}{2}$  lbs. butter, 6 eggs,  $\frac{1}{2}$  oz. saleratus; ginger to your taste.

#### DIRECTIONS FOR MIXING.

Have the flour in a pan or tray. Pack a cavity in the center. Beat the honey and yolks of eggs together well. Beat the butter and sugar to cream, and put into the cavity in the flour; then add the honey and yolks of the eggs. Mix well with the hand, adding a little at a time, during the mixing, the  $\frac{1}{2}$  oz. saleratus dissolved in boiling water until it is all in. Add the ginger, and finally add the whites of the 6 eggs, well beaten. Mix well with the hand to a smooth dough. Divide the dough into 7 equal parts, and roll out like gingerbread. Bake in ordinary square pans made for pies, from 10x14 tin. After putting into the pans, mark off the top in  $\frac{1}{2}$ -inch strips with something sharp. Bake an hour in a moderate oven. Be careful not to burn, but bake well. Dissolve sugar to glaze over top of cake. To keep the cake, stand on end in an oak tub, tin can, or stone crock—crock is best. Stand the cards up so the flat sides will not touch each other. Cover tight. Keep in a cool dry place. Don't use until three months old at least. The cake improves with age, and will keep good as long as you will let it. I find any cake sweetened with honey does

not dry out like sugar or molasses cake, and age improves or develops the honey flavor.

New Hampton, N. Y.

E. D. HOWELL.

#### WEIGHTS OF $1\frac{3}{4}$ SECTIONS.

Weights of filled sections, as taken from sales book of last fall. Those cases that held out weight best were clover honey; the lighter, buckwheat.

|                      |                         |
|----------------------|-------------------------|
| 40 sections, 36 lbs. | 40 sections, 34 lbs.    |
| 24 " " 20 "          | 40 " 37 "               |
| 24 " " 24 "          | 40 " 38 "               |
| 20 " " 17 "          | 40 " 41 $\frac{1}{2}$ " |
| 40 " " 40 "          | 20 " 18 $\frac{1}{2}$ " |
| 20 " " 19 "          | 24 " 24 $\frac{1}{2}$ " |
| 20 " " 19 "          | 20 " 19 "               |
| 20 " " 18 "          | 40 " 38 "               |
| 40 " " 40 "          | 40 " 38 "               |
| 24 " " 22 "          | 20 " 19 "               |
| 200 " 170 "          | Buckwheat.              |
| 40 " 33 "            | " "                     |
| 12 " 12 "            | White.                  |

I use  $4\frac{1}{4} \times 4\frac{1}{4} \times 1\frac{1}{4}$  sections, with slotted separators. You will find by figuring that they average very nearly 15 oz. The above figures were taken just as they appear on our book—no skipping about.

R. A. TOBEY.

Caton, N. Y.

#### AN UNUSUAL EFFECT OF BEE-STINGS.

I have read a good deal about bee-stings curing rheumatism, and affecting people in different ways; but I have read of none who say bee-stings affect them as they do me. I have handled bees since I was a child, or about nine years, and have been stung frequently, as all bee-keepers are, and until the last two years the stings did not affect me a particle; but now if am stung on the hands my eyes will become inflamed and swollen. It doesn't seem to make any difference as to the part of the body I am stung, it seems to settle in my eyes. It seems to affect my eyes more if stung several times on the hands. Perhaps the very idea of the bee-stings affecting my eyes may seem ridiculous to some of the more experienced bee-keepers. I can't claim experience only as to the bee-stings, for I am one of the few girl bee-keepers.

This is the second year I have kept the bees although I have worked with them a little for eight years. I always thought any one was a bee-keeper who owned a few hives of bees.

LUCYERIA BEEBE.

Rocky Comfort, Ark., Apr. 2.

[While your experience is a little bit unusual I have known quite a number of instances where persons were affected in the same way. In your case I would advise you to veil yourself very closely, and perhaps wear gloves. At the same time, be very careful about approaching the bees when they have the least tendency to be cross, after a rain or during a time of robbing. As you say you have the A B C book, I would advise you to read the subject of "Bee-stings," especially that item concerning jerking the hands back.

You need especially to have a good smoker. If you have the bees thoroughly smoked, if dis-

posed to be cross, you will be able to avoid stings almost entirely; in fact, the writer goes through the season with very few stings. We use exclusively in our apiary the pure Italian leather-colored stock, not the five banded bees. They are apt to be more or less cross. I am careful to make slow motions immediately over the open hive, and very often work day after day without a single sting. There is no good reason why any one should be stung from six to eight times a day.—Ed.]

#### BUILDING COMB ON WIRE WITHOUT FOUNDATION. A LA BOARDMAN.

I have been somewhat interested in the advancement of apiculture for the past twenty years, and am not a little surprised at reading H. R. Boardman's article on page 160, March 1. I had supposed that the most of the bee-keepers of to-day were using wired frames. As far back as 1880, when I lived in Wisconsin, we wired all of our frames, using two wires horizontally across the frame, but we found it was difficult to get them taut enough without springing the bottom-bar; and to obviate this we substituted a strip of wood, about  $\frac{3}{8}$  inch thick, horizontally across the frame; but this took up too much room. We now use wire, and find the bees build more readily on them than they do without. We use about an inch of foundation for a starter, and we get as fine combs as one would wish to see. We have 1000 frames wired, and ready to be filled with comb. This season we put our wire lengthwise of the frames, running it from the end of the top-bar to the end of the bottom-bar on the opposite end of the frame, using two wires running in opposite directions, and we find it stays the frames, and the bees take readily to it. We use No. 24 wire, but I think 26 or 28 would be better, perhaps 30. In this climate, when the mercury registers 120 we find that new comb is pretty apt to fall down when it is full of brood and honey; whereas if it is wired it would have to melt before it would fall, and the wire does not seem to interfere with brood-rearing in the brood-nest.

Now, Mr. Root, perhaps I am behind the times; but it sometimes seems to me, when I am reading GLEANINGS and some of the other journals (for I read every thing I see that says b's b's b's) that there are others who are behind the times a little as well as my unworthy self.

M. H. DUNN.

Fullerton, Cal., Mar. 10.

#### FASTENING FOUNDATION TO THE TOP AND SIDES IN SECTIONS AS A REMEDY FOR ONE-SIDED COMBS.

I see in GLEANINGS there is considerable discussion about comb honey being stuck fast to the separators, making a one sided comb. I don't see how the foundation could swing to one side if it is fastened to the top and both sides. I use full sheets in sections, and fasten

to the top and sides with melted beeswax, and never have any such trouble.

Perhaps these large bee-keepers use foundation fastened to the top only. This, I think, is a very poor way. One will find that most one-sided combs come by the foundation swinging to one side by a jar in handling the supers before they are put on the hive. That has been my experience.

EDWIN RICKARD.

Schoharie, N. Y.

#### THE NEW DRAWN FOUNDATION; IS THERE DANGER THAT IT WILL REDUCE THE PRICE OF COMB HONEY?

Your samples of deep-cell foundation came to hand perfect. I congratulate you on your success. It is a veritable triumph of mechanical skill, and will doubtless prove the same as a business enterprise. There are some questions in connection with it that have not been mentioned in the bee-journals so far, and which time only may determine. For instance, will it increase our output without lowering the price?

WM. RUSSELL.

Minnehaha Falls, Minn., Apr. 24.

[I think there can be no question but that the new product will enable the bee-keeper to produce more and better comb honey—more, because the bees will enter the sections quicker, and better because the sections will be better filled out. It may possibly reduce the price; but I hardly think so, because the price is already too low to leave much of a margin. The effect will be to make more profit, and the better-filled combs will tend to increase the price if any thing.—Ed.]

#### FLIGHT OF BEES FOR HONEY.

Please tell me how I can get my bees to go about  $2\frac{1}{2}$  miles where there is abundance of poison oak that affords quite an amount of bee-pasture, and do not wish to remove the hives there.

W. C. MYER.

Ashland, Or.

[I can not imagine why you should desire your bees to find pasture on the poison oak. If the tree is poisonous in its character there will be a great liability of its affecting the honey, rendering it a source of danger to bees as well as human beings. Usually bees will not fly over a mile and a half; but they have been known to go not only two miles and a half, but even five and ten miles; but the latter distance was across a body of water. Such cases as these are exceedingly rare. Our bees have gone two miles and a half; but when the honey flora gave out within a mile or a mile and a half they extended the distance a little further until they reached the distance named. You can generally set it down as a rule that, when bees find plenty of forage within a mile and a half, they will not go further.—Ed.]

I have a young queen a few days old. I see no drones nor drone-cells. What must I do in order to get her fertilized?

D. L. PERINE.

Good Hope, W. V., Apr. 15.

[If there are other colonies in the vicinity, there will be no trouble about the queen mating. There are always a few scattering drones early in the season.—Ed.]

## HOW TO PRESERVE MEAT WITH HONEY

After the pork is properly smoked, take pure honey (fall honey will do) and liquefy it if candied, and stir in enough finely ground black pepper to make it pretty thick; then with a cloth or a cheap new paint-brush rub this mixture all over and well into the meat; then hang in some cool dry place until wanted for use. A wheat-granery is a good place. Try this and see how sweet and nice the meat will be.

Nye, Ind.

C. A. BUNCH.

J. T. E., W. Va.—You can remove the outside frame, as you suggest, and put an empty comb in the center of the brood-nest profitably now.

J. B., Minn.—Bees sometimes gather maple sap; but as the conditions favorable to the flow of sap are not generally favorable to the flight of bees, very little sap is gathered in this way. The bees may gather honey from flax-blossoms. They will gather nectar from almost any flowers in some seasons.

L. T., Ont.—If your neighbors' bees rob yours it indicates that your colonies are weak or your entrances are too large. Contract the entrances down so that only one bee can pass at a time; and as the colony increases in strength, enlarge the entrance. For particulars, see "Robbing," in our A B C book.

J. M. S., Cal.—To get rid of ants, find the nest; and, with a crowbar, or stout pick, make a hole in the center of the nest about a foot deep. Then pour into it about five cents' worth of bisulphide of carbon, and stop the hole up tight at the top. This will kill all the ants. For further particulars, see "Ants," in our A B C of Bee Culture.

M. E. S., Fla.—It is very seldom that the bees show a disinclination to go through a bee-escape. Sometimes it may be advisable to give them a little start with smoke. After they get started going through they will pass into the brood-nest below with a rush. Of course, if the queen or brood should happen to be above in the sections, that of itself would have a tendency to hold the bees above.

R. L. S., Kan.—The idea that bees will injure alfalfa is perfectly ridiculous. It is well known by all those who know any thing about the fertilization of flowers that bees, so far from doing any damage, are a positive benefit. We send you a pamphlet on "Bees and Fruit" that ought to settle the matter. If you hand it to your neighbor we think it will convince him—that is, if he is open to conviction.

A. R. D., Oregon.—In your climate you can probably introduce queens at any time now. The royal jelly referred to is a milky food that is found in queen-cells. It is usually dipped out by means of a tiny wooden spoon, so to speak, and deposited in cell-cups along with the egg from which the queen is to be reared.

W. H. W., Ky.—The first thing to do is to determine whether your hive is queenless. In order to do this, put in a frame of unsealed larvæ or eggs from one of your other colonies; and if the bees build queen-cells then you may know absolutely that they are queenless. If you have no other colony from which you can get eggs or larvæ, then look through the hive two or three times very carefully, and see if you can see the queen. If you do not find her, it might pay you to send and get a queen.

J. D. W., Md.—It is true that we speak of sending larvæ by mail for the purpose of rearing queens; but it is not practicable to have them go any great distance—in fact, out of our own State; and even when sent to points within the State, it has so often proved to be a failure that we have abandoned the practice. The price at which untested queens are sold makes it entirely unnecessary to send for larvæ and run the risk of raising queens. When you get an untested queen you get entirely new stock, and probably a queen that is fertilized by a pure drone.

D. L. P., W. Va.—We would advise you to put a frame of unsealed larvæ or eggs from one of your other colonies into the hive which you think is queenless. You can not always be positive, at this time of year, whether a colony is queenless or not; but by putting in the eggs or larvæ you can determine the point by noting whether they build queen-cells. Some drones will doubtless be flying by the time your young queen is ready to mate. If there is already a queen in the colony which you think is queenless, putting in the larvæ will do no harm, but good. If no cells are built you will know there is a queen in the colony.

W. G., Okla.—In answer to your question as to whether bees will clear their own hives of drones themselves, I would state that they will not do so until after the honey season. Just as soon as the honey-flow is stopped they will begin killing off their drones. The modern bee-keeper does not care to raise any drones unnecessarily, as they are consumers during the honey-flow. By the use of comb foundation there is nothing but worker-cells in the ordinary comb; and the consequence is, there are very few if any drones reared. It does not pay to keep drone comb in the hive. If there is any it should be cut out and replaced by worker. If the drones are already raised and in the hive you can catch them in the Alley drone-trap illustrated in our catalog.

HE doctor and Fred immediately hastened to the cliff, the latter almost flying up the terrace. Upon the edge of that tract of obsidian points

they found Alfaretta lying insensible if not dead. The donkey was, sure enough, dead; in his struggles upon those knife-like projections he was literally cut to pieces. Gimp had tried to rescue Alfaretta, but had sustained only severe cuts from those knife-like edges. Fred, more methodical, secured a club and broke down all intervening points; then, tenderly lifting Alfaretta in his arms, he carried her to a place of safety. When thrown from the donkey she struck the obsidian points in such a way as to break them off. Blood was flowing profusely, and the doctor ordered her to be borne to the cabin. A cot was sent for, and she was carefully carried down the terrace to her cabin.

The doctor, with the aid of the two squaws, made an examination of the wounds, and found nothing serious except that there was a piece of obsidian driven firmly into the skull in the parietal bone near the coronal suture.

The doctor explained to Fred that he dared not just now remove it; "for," said he, "there are certain conditions that may follow which may result in death. But how did this all happen? The donkeys have always kept at a proper distance from those places."

Gimp, whose wounds had been carefully banded by Sam, gave the following explanation: "Yer see, mister doctor, Alfaretta was a ridin' that ere donkey jest as proud as ef she was the queen of Sheber; and yer know that ere little queen-rearin' row of hives on the heeltrope terrace? Wal, the donkey tipped one over; the bees want much cross, but one stung the donkey's ear, and then he jest landed his heels right an' left, an' jest run over an' kicked over the hull row, includin' them big swarms in the center; then he seemed ter think that place out amongst the glass knives a good place to roll, and, accordin', he rolled; an', poor donkey! he'll never roll any more; an', what's more, I'm feared Alfaretta never'll ride any more. D'y' think, doctor, she'll die? Doctor, she's been gooder'n a sister ter me, even if they du say her mind has sprung off the hinges."

"Gimp," said the doctor, "I hope she will

recover; and, though her life hangs by a slender thread, we must hope on."

Then, after pacing up and down before the cabin a few moments, he stopped, and, addressing Fred, said, "Fred, that piece of obsidian must be removed, even if death follows. Come with me."

Dr. Hayden prepared himself with the necessary accessories, and proceeded to perform the delicate operation. Fred was too excited to be of any aid; but the two squaws were stoical enough to correctly render the little aid the doctor required. The scalp was turned back from each side of the wound, and the piece of glass-like substance was carefully removed with a pair of pincers. A perceptible pallor came over the doctor's face at the crucial moment; but a little later an expression of surprise shone from his eyes; for, with the piece of obsidian, there came a piece of the skull about the size of a nickel. The doctor carefully laid this to one side and proceeded to dress the wound by first trepaning the skull. Alfaretta began to show signs of reviving under this operation, and a little chloroform was used to complete the operation. As soon as the scalp had been replaced and a few stitches taken, the doctor left his patient in the hands of the squaws; and, taking the small piece of skull in hand, went out to where Fred was anxiously waiting and pacing to and fro beneath the oak-tree.

"See here, Fred," said he, holding the little bone in his hand; "this piece of skull came away in the operation."

"But, doctor," said Fred, in deep anxiety, "what is to be the outcome?"

"Wait a moment and I will tell you," replied the doctor. "By a wonderful chance—no, I will say providence—this obsidian splinter penetrated Alfaretta's skull at the identical point where she was injured by the spar striking her head in San Pablo Bay. Now, see; this little bone, or granular formation, or bubble-like excrescence, protruded and crowded against the brain; and so wonderfully delicate is that organ that the least displacement of some portions of it causes trouble. In the case of Alfaretta it was so-called insanity. Now, furthermore, if I mistake not, when she revives she will be a sane, sensible young lady."

"Doctor, I am overjoyed at what you tell me. Alfaretta sane! I can hardly picture such a

future; and to return her thus to her parents—or — or — excuse, me, doctor — to her foster parents."

"Yes," said the doctor. "It is hard for you to realize that she should be any other than Miss Buell; and whatever occurs, Fred, you must not hint to her my relationship to her; for if she does indeed recover, as I think she will, I wish to make all these matters known to her myself, and in my own way."

"Your admonition shall be respected," replied Fred.

"And, Fred, there is another thing which may seem strange to you; and upon this point I will give you warning. When Alfaretta returns to consciousness she will take up the events of her life where she left them in San Pablo Bay. Her life since that day will be a blank, and she will have no memory of you or any other person she has met since."

"Is it possible?" exclaimed Fred; "then I shall have to get acquainted with her as though she were a stranger."

"Yes, Fred; and if you have indulged in higher sentiments toward her you will have to renew them now to a sane person; and, if I mistake not, to win her will require talent. But, come; Alamantapola is calling, saying there is a change in the patient."

They both hastened to the cabin, and there was indeed a change. Alfaretta was sitting up in the cot. There was an intelligence in her every look as she surveyed the group around her.

"Where am I? oh! where am I?" and she grasped the clothing around her neck as if to loosen it for better breathing. "Where am I, and why am I left with these strange people? Where are my parents? Where are Mary, Fanny, and William? Were my companions drowned? Oh! that terrible moment! Oh! where am I? Take me to my home, to mother and to father!"

"There, there!" said the doctor, soothingly, as he observed her excitement. "You are with friends, and many strange things have happened to you since the boat was capsized. Your parents and friends are well, and you shall see them all in good time; but now you are weak, and must rest."

The doctor and Fred again left the cabin, the doctor giving Alamantapola and the other squaw instructions respecting the patient.

"That seems strange," said Fred. "After following me, and taking such an interest in finding me, she does not know me." And Fred

(so inconsistent is human nature) began to wish she were insane again.

Alfaretta began to regain strength, and, after many days' confinement to the cabin and to the tender care of Alamantapola, she was permitted to take short walks under the oaks. A hammock had been slung in a convenient place, and many hours she sat here, either reading or in reverie. Her appeals to those around her to know about her people, and why they were not with her, were put off under one pretext and another, but all bearing upon the point that she was not strong enough.

"Why, Fred," said the doctor, "the revelation that we have to make to her will require all of her strength; in her weakened condition it might prostrate her again; but now in a few days I think she can bear it, and you can break the matter to her as you see fit."

"THE DOCTOR PROCEEDED TO DRESS THE WOUND."

And so it came to pass that, one day while Alfaretta was sitting under the oak-tree, Fred sat down near her, and said:

"Miss Buell, it seems that you have no remembrance of meeting me previously to seeing me in this valley?"

"No, Mr. Anderson, I have no recollection of meeting you."

"Do you remember living upon the Sacramento River?" said Fred: "and do you remember seeing a bee-ranch on the bluff, where I produced a nice lot of honey? and then do you remember the fearful flood that washed my bees, Mat Hogan, and myself down the river? and do you remember helping to rescue me, and"—

"Why, Mr. Anderson," interrupted Alfaretta, "what a fantastic story you are telling me! I lived in Berkely with my parents; and, Mr. Anderson, you must have some other person in your mind; and," said she, with a little laugh, "you are a romancer indeed."

"Now, Miss Buell," said Fred, "if you will tell me the date of the accident in San Pablo Bay I will try to reveal what seems a mystery to you, and why you are not with your parents."

"Let me think," said she; "vacation—ah, yes! it was the 25th of September."

"What year?" asked Fred.

"Why, what a question, Mr. Anderson! you are so puzzling!—this year, of course, 1887."

finally the cause of her recovery. She said not a word during the recital, but sat in a stupor of bewilderment.

"So strange!" said she, finally. "My poor dear mamma!" said she; "how she must have suffered all these years! Let me go to her—let me go now."

"You shall go in good time," said Fred; "but Dr. Hayden thinks you are not strong enough to take the journey."

"Hayden! Hayden!" said Alfareta. "Hayden! why! papa had a cousin by that name; but he was killed in South America several years ago."

"That was a false report," said Fred; "this Dr. Hayden is your kinsman, and you are in safe hands. Be patient; all will be well. Remember there is a providence in all this. There is a divinity that shapes our ends, rough hew them as we may."

"WHERE HAVE THOSE FIVE YEARS GONE?"

"Now, Miss Buell, you must not be surprised; but look at this almanac."

"What!—1892!" she said, slowly; "impossible, sir," said she, severely; "are you deceiving me?"

"How can that be, Miss Buell, when this almanac speaks for itself? Take it and look it over thoroughly. You observe there can be no deception, but—"

"Five years! five years! O sir, how strange! how very strange! Am I dreaming? am I sane?" And she gave way to tears, and, looking at the almanac again, she said, brokenly, "Where have those five years gone?"

"Miss Buell, you surely are now in your right mind; but for five years and a half you have been mildly insane."

Then Fred told her the story of the past five years, as far as he knew it, and all the incidents in which she had taken an active part, and

#### PREPARING COMB HONEY FOR SHIPMENT; EXCELLENT SUGGESTIONS.

In regard to shipping honey, are there not a few things to be observed by the shippers that have not been mentioned? One is to mark crates, requesting them to be loaded lengthwise of the car, so the jar will come against the edge of the combs. Another is, when using small crates nail two or more together so they can not be tossed from one man to another. There is more freight injured in this than in any other way while being handled. A box of a convenient shape, weighing less than 50 lbs., is frequently tossed by local freight men. They are paid by the trip, while men at regular transfer stations are paid by the day, and are not in such haste, consequently do but very little damage to freight. Trainmen are expected to use particular care to avoid damage to goods or property, and frequent occurrences of the same are regarded as incompetency on their part; but they are obliged to judge principally from the damage to property, for they can not find out so well about goods.

Reynoldsville, Pa. A. M. APPLEGATE.

#### DISCOURAGING FOR FLORIDA.

Prospects here are for an almost absolute failure of this season's honey crop. Bees are in splendid condition, but the saw-palmetto is putting on not much over a tenth as much bloom as usual.

O. O. POPPLETON.  
Stuart, Florida, April 7.

WISCONSIN now has a good foul-brood law, and N. E. France, of Platteville, Wis., is inspector. It goes without saying that foul brood will be cleaned out of Wisconsin, root and branch.

In our last issue, page 340, we inadvertently said that anywhere from \$5000 to \$10,000 worth of queens was sold in a single season in this county alone. Of course, the general reader will understand that we meant *county*.

WE are having a large amount of fruit-bloom, heavy rains, and lots of brood-rearing. In our locality it looks as if the season would be two or three weeks backward. Brood-rearing having started a little later than usual, we shall hope that basswood and clover will come on a little later.

I CAN not see why there should be any acrimony shown over the fact that the new organization, the United States Bee-keepers' Union, has a name similar to the National Bee-keepers' Union. As every one knows, when the constitution was drawn up it was with the idea of amalgamation. As that was voted down by the old organization, the new one had to go under the name proposed for the two amalgamated societies. Just as soon as there can be a meeting I do not think there will be any question but that the name will be changed; and, by the way, I do not see that there needs to be any feeling of rivalry between the two Unions. They have separate lines of work, and to a large extent the members of one society belong to the other.

#### THE CHARACTER OF COMB FROM DRAWN FOUNDATION.

WE are constantly experimenting with and testing the new drawn foundation. The results of the former experiments have been confirmed in every case; namely, that the bees accept the new product immediately, no matter whether honey is coming in or not. In cases where ordinary foundation is gnawed into, the new drawn article is accepted at once. We placed a sample of it in the center of the brood-nest, between two dark combs. In a day or two its *whole character* was completely changed. Instead of being of a pearly, transparent, polished white, as it leaves the dies, it assumed a dingy-yellow, opaque, roughened appearance, like the comb around it. The surface of the walls had been completely worked over, so they were as thin as natural. There can be no question about its utility in the hive; and its "character" is made to conform almost identically to comb made wholly by the bees. Except for the flat base, which the bees do not change, the

fully completed comb, empty, could not be distinguished from the natural-built comb made by the bees without even the use of foundation.

#### WORK FOR THE NEW UNION; PURE FOOD LAWS IN EVERY STATE.

THE Board of Directors of the new Union, if I am not very much mistaken, will recommend that the organization devote its attention to the enactment of pure-food laws in every State of the Union. Of course, this work can not be done in a day nor in a year, and perhaps not in several years, and in some States, perhaps, never. It has been recommended that the organization commence first with Illinois. In that State, more than in any other, there is need of just such a law, as Chicago now seems to be the center of glucose-mixing. If the U. S. Bee-keepers' Union were to send C. P. Dadant and J. A. Stone to Springfield, to buttonhole the members of the Illinois Legislature, there might be a good prospect of a law being enacted in our favor. Both of the bee-keepers mentioned are strong and influential men, and I believe that Dadant, as a lobbyist, can stick and hang like a tiger.

The salutary effect of a pure-food law in Illinois would have its immediate effect in Chicago. The adulterators in that city know that there is no law, so they can palm off their vile mixtures as much as they like. The effect of the recent enactment of a pure-food law in California has been most gratifying to the friends of pure honey. I have already announced that glucose mixers have been arrested, and now, of course, the rest will proceed very cautiously in their nefarious business. There are already good laws in Ohio and Michigan, as I happen to know. There are doubtless other States with good laws; but in the great majority there are no pure-food laws.

#### A BACTERIOLOGIST AND FOUL BROOD.

F. C. HARRISON, Bacteriologist of the Ontario Agricultural College, is about to make the subject of foul brood a special study. He has written us for the privilege of consulting our works here at Medina—a privilege which we have most gladly accorded him. After acknowledging his thanks he writes:

*E. R. Root*:—I should be glad to make bacteriological examination for foul brood of any suspected material that may be sent me, without charge, and I should be indebted to you to publish this fact in your paper. My object in doing this is to get hold of as much material, and from as widely different sources, as possible.

F. C. HARRISON.  
Guelph, Ont., Apr. 28.

Those of our readers who have foul brood in their apiaries will, we hope, be kind enough to forward specimens of the disease to Mr. Harrison. If they are doubtful as to its being real foul brood, send a sample any way, and learn what it is. The only regret is that Ontario, with its splendidly equipped agricultural col-

lege, is not in the United States. But even if it is not, I am sure we bee-keepers on this side of the line will be very glad to assist in any way in our power.

#### ARBITRATING DISPUTES BETWEEN COMMISSION HOUSES AND BEE-KEEPERS.

A DIFFICULTY arose between one of our prominent commission houses and a bee-keeper. Both parties finally agreed to have the matter arbitrated by the National Bee-keepers' Union. All correspondence was submitted to General Manager Newman, and by him turned over to a board of arbitrators. Each arbitrator turned in his own decision independently and without the knowledge of what any of the other members had decided or would decide. These decisions were laid before the General Manager, with the result that the commission house was to pay the bee-keeper a difference of \$10.00 as settlement. These three or four men, acting as arbitrators, certainly could have no interest one way or the other; and while the decisions would probably please neither party exactly, it is probably as nearly fair as any thing could be.

It strikes me that this method of settling difficulties between an honest commission house and a bee-keeper equally honest is the way. Very often I have been called upon to act as arbitrator in disputes of this kind; and, no matter which way I have decided, I was sure to merit the ill will of one of the parties; but when a *body of men* reach a conclusion, and unanimously decide upon a certain plan of settlement, neither party has much ground for feeling that he was not given fair treatment.

#### "BEE PIZEN."

GENERAL MANAGER NEWMAN does not seem to take it very kindly that the editor of the *American Bee Journal*, Mr. York, should deem his official acts and utterances as proper subjects of criticism; and in replying to an editorial on page 248 of the *American Bee Journal* he uses some pretty harsh language. Referring to the present editor of the paper that he himself once edited, he says: "If the writer intended to be honorable he would not attempt to misinterpret the quotations from my report." Other expressions, such as "bombastic," and "contemptibly mean," are uncalled for when directed at one who worked with him for years in the same office—in the same harness, as it were—striving to make the "Old Reliable" the good paper that it was. In another bee-paper Mr. Newman refers to the publishers of the *Bee-keepers' Review* and of this journal as the "worst enemies" of the pursuit of bee-keeping—one for one offense, and one for another.

I remember of once hearing Mr. Newman at a convention recess say that he often found it necessary to withdraw the "stings" from certain articles that were sent in to him for pub-

lication, as he thought it was unwise and unnecessary to wound; that argument courteously given was more effective. His policy was a good one, and is practiced by many a wise editor. Now that he is out of the editorial harness of the *American Bee Journal*, it seems to me he has forgotten himself. The force of his articles would have been *very much greater* if he had pulled out the stings rather than to have sent them as they were for publication, bristling with "bee pizen." Such violence of language quite defeats its end, and I am surprised that Mr. Newman should not see it so.

#### PETTIT'S NEW SYSTEM OF PRODUCING COMB HONEY; EXPERIMENTS AT THE ONTARIO AGRICULTURAL COLLEGE.

ON pages 51 and 160 we have published articles relating to Pettit's new system of producing comb honey, or, rather, a method by which the outside surfaces of the two rows of sections next to the super sides may be filled out as well as the surfaces in the center of the super. Experimenter R. F. Holtermann, in the Twenty-second Annual Report of the Ontario Agricultural College, says: "Comb-honey producers know that, with rare exceptions, in the comb-honey supers now used, sections having their faces to the wood are filled last, and the inner sections have to be left capped and finished on the hive, waiting for the bees to finish the surface of the sections joining the wood."

The idea of S. T. Pettit, of Belmont, Ont., already outlined in these columns, was made the subject of an elaborate experiment last summer at the Ontario College. The main objects in the experiment, which I give in the language of the experimenter, are thus set forth:

1st. To compare the number and size of pop-holes in the sections of supers with the bee-space above and those without. Those without had a quilt next the sections; those with, had a board with  $\frac{1}{4}$ -inch bee-space over the super, between the board and the sections.

2d. To compare comb honey having the face of the last sections and wood sides of supers separated by only the usual one bee-space, and those having two or more bee-spaces. The two or more bee-spaces were secured by means of dividers of different construction. Some were of solid boards with holes bored in them. Others were made of strips. The bee-space used was  $\frac{1}{4}$  inch in every case, and it is very important that this should be exact.

Following is the result of the work of seven colonies with cloth and no bee-space over the sections.

- Hive No. 1.—An average percentage of pop-holes.
- Hive No. 2.—Same as number one.
- Hive No. 3.—Pop-holes slightly more numerous than the average.
- Hive No. 4.—Rather better than preceding supers.
- Hive No. 5.—Although sections were particularly well filled, the pop-holes were remarkably numerous.
- Hive No. 6.—A still larger percentage of pop-holes in the corners both at top and bottom.
- Hive No. 7.—About the same as No. 6.

The result of experiments with  $\frac{1}{4}$ -inch bee-space over the sections, nine colonies in the group, is as follows:

- Hive No. 1.—About 10 per cent fewer pop-holes than the average of the above.
- Hives Nos. 2 and 3.—Same as number one.
- Hives Nos. 4, 5, and 6.—About 7 per cent fewer pop-holes than the average of above.
- Hive No. 7.—Still fewer pop-holes.

Hives Nos. 8 and 9—A very decided advantage over no bee-space.

Hive No. 10—About the same as the average of those having no space above.

Nos. 11 to 16 showed a smaller percentage of pop-holes.

#### GENERAL REMARKS.

One fact was very conspicuous, viz., that the pop-holes in sections with  $\frac{1}{2}$ -inch bee-space were smaller than in those without. This report tallies with results obtained from experiments conducted in previous years, but not before reported. The probable reason for there being fewer and smaller pop-holes with the bee-space above the sections, is, that the bees appear to require a space to pass from section to section, and a bee-space above facilitates this passage.

The result of the experiment with two or more bee-spaces between the side of the super and the face of the section next the side, is as follows:

Two bee-spaces and divider at one side of the super and only one bee-space at the other.

Hive No. 1—The outside of sections with the two bee-spaces and divider were better finished and cleaner than the side with only one.

Hives Nos. 2 and 3—Same as number one.

Hives Nos. 4 and 5—No perceptible difference as to finish of comb, but the sections were cleaner.

Hive No. 6—A difference in favor of the two bee-spaces.

Hive No. 7—A marked difference in favor of the two bee-spaces.

Hive No. 8—The side with two bee-spaces decidedly cleaner and better finished.

Hives Nos. 9 and 10—Two bee-spaces on each side of the super, both sides clean and perfect.

The dividers were differently constructed. One set had holes bored  $\frac{1}{8}$  inch in diameter and  $3\frac{1}{2}$  inches wide, and material was  $\frac{1}{2}$  inch thick. The other set were made of strips the entire width of the divider,  $3\frac{1}{2}$  inches, and seven strips  $\frac{1}{8}$  inch wide with  $\frac{1}{2}$ -inch spaces between. The dividers with the holes gave the best satisfaction. With the strips there were more burr-combs and the comb opposite the space between the strips was ridged, giving the entire section a ribbed and uneven appearance, a modification of what we find in the common washboard. Five other hives were supplied with two spaces on one side and one on the other. In three there was no marked difference; in the other two there was a difference in favor of the two bee-spaces. Two hives were provided with queen-excluding metal as dividers. The result was as good as with any other divider; but owing to the limber and pliable nature of the zinc and the importance of having the bee-space neither more nor less than  $\frac{1}{4}$  inch, we would not recommend this material.

The results of the above test and those obtained from other hives in the apiary, show a marked difference in favor of the two bee-spaces. The reason would appear to be that, with two bee spaces, the extra layer of bees on the outside keeps up day and night the normal heat necessary for comb-building and capping. With more than the regular bee-space and no divider, the bees would, as is well known, extend the comb until, before the point of capping is reached, the space would be reduced to the regular size. Several tests were made comparing a still larger number of bee-spaces and dividers, but no additional advantage was shown, and possibly they furnished too much loafing-space for the bees. The one divider and two bee-spaces, during the past season, showed a great advantage in this method of taking comb honey.

Engravings from photos reproduced show a marked difference in favor of the Pettit system. These I would reproduce here; but for lack of time I bring it before our readers at this time, as just now is the time to fix up supers in order that the experiment may be tested.

By the old plan these outside rows of sections had to be sold at a considerably lower price; and the little expense necessary to make this experiment is so trifling that every comb-honey producer can well afford to try it, as it can be adapted to any hive or super.

In brief, Mr. Pettit's system is a scheme to

get the bees to seek the sides and ends of the hives after they come in loaded with honey, rather than to crawl up through the center of the brood-nest, thence into the center of the super. By dispensing with one row of sections Mr. Pettit uses a divider or separator perforated and bee-spaced on both sides, between the outside rows and the sides of the super. As there is only a bee-space on each side of this divider, bees will not utilize this room for building comb; but there will be a double row of bees here on each side. The consequence is, additional warmth is secured—at least, enough it is said to make it equal to the center of the super. This extra warmth, and the fact that the bees find it easier to seek the sides of the hive than the center, induces them to fill all the sections simultaneously, and to make the outside faces of the combs of the outside row of sections as perfect and as nice as those of the center comb.

Although theoretically, at least, this scheme of Mr. Pettit's seems to be good, and although it has worked well in his hands and at the experiment station, Ontario, it may not prove to be equally successful with bee-keepers at large; but nowadays, in consideration of the low price of honey, we should all grasp at every idea that promises to give us more and better honey.

#### EXPERIMENT IN WINTERING.

This experiment related to the advantage of having a horizontal open space through the center of the brood-nest during the winter so that, when the cluster contracts by reason of the cold, it could draw up toward the center. The experiment seems to show that a divisible brood-nest with a horizontal space between the two sets of frames allowed the bees to contract to better advantage than in a deep brood-nest made up of one set of frames. Mr. Holtermann calls attention to the fact that "as long as many bees are together they do not easily chill; but when one or more become separated they soon chill and perish. The natural direction for the bees to travel when the cluster contracts is toward its center; and it will be found that the bees which, by contraction, become detached from the main body of the cluster, perish, owing to their inability to travel around the top and bottom of the combs. With a  $\frac{1}{4}$ -inch space between the two sets of combs the swarm can expand or contract without breaking the cluster, the bees passing between the two sets of frames."

Mr. Holtermann states that "an experiment will be made during the winter of 1896-'97 to test the value of winter-passages cut in ordinary combs." The experiment has now probably been made, and the results determined, but not yet published. Mr. Holtermann expresses himself as believing that "if these passages prove as advantageous as the space in the two sets of frames, they will be much more desirable."

### MEDICINES FREE OF CHARGE; ELECTRO-POISE; THE AIR-SHIP, ETC.

Doubtless many of you, at least if you read the advertisements, have noticed the great number of remedies that are sent absolutely free, postage paid and all. The quantity sent is only a sample, of course, so you may see the thing really has virtue. When I first saw it I said to myself, "Why, it certainly must have something of real merit or they could never afford to send it free of charge and pay postage besides."

But to make sure of the thing I sent for a sample. The first was the wonderful "kakava." The sample received looked like dried bark or leaves of some plant. The taste of the "tea," prepared from it reminded me at once of Warner's Safe Cure. No doubt it is a preparation from the same plant. I once took about a dozen bottles of the Safe Cure, as you may remember. This kakava was warranted to have a wonderful effect on the kidneys. It would "save the trouble of getting up several times during the night," etc. I was very anxious to have the medicine succeed, and I certainly had a great amount of faith. Now may God help me to advise wisely and carefully in regard to this matter of medicines for many infirmities.

Along with the sample came, free of charge, a little box of pills. There were a dozen or more. In order to have the root do its best, the patient was to take a pill every night. I took the pill, as a matter of course. I had been troubled with constipation, as most people are who are on the lean-meat diet. The pills were certainly very good ones—that is, they were the pleasantest and mildest physic I think I ever found, and, as a matter of course, they made me feel better. The pills certainly gave at least temporary relief; but the kakava root without the pills, I honestly believe, had no effect one way or the other. Perhaps I ought to be ashamed of myself to grumble or find fault when the medicine was furnished free of charge, postage-stamps and all. I am not going to complain; in fact, I have sent them enough to pay for the medicine and the postage, because I do not want the remedy for nothing. You may say, "Why not keep on with their medicine, and why not take the physic?" Because I am sure God did not intend that his creatures should force Nature to do her work by the use of physic.

Apples are even now quite plentiful around Medina. Farmers have been bringing in some very fine ones at prices ranging from 25 to 50 cts. a bushel; and there are a few apples in the market at that price even now, this 6th day of May. All along during the spring, I thought of the apples I enjoyed so much from our own trees last fall, and tried repeatedly those offered for sale this spring. Either I am different or the apples are different, I am forced to conclude, for they did not "set" well. They made me think of the Irishman who had just eaten his first peaches. He said he liked the flavor of the fruit very well, but the "seeds" lay rather heavy on his stomach. You see the poor fellow had swallowed stones and all, not having seen peaches in the old country. Well, a few days ago a boy drove up with some remarkably fine apples, and asked me if I did not want some Belmonts.

"Belmonts?" said I in surprise. "Why, my dear young friend, the Belmont is a *fall* apple."

"Yes, I know; but these were kept in cold storage. We just took them out to-day."

He then handed me one. Now, you would all think me foolish if I should tell you just

how *much* I enjoyed those Belmont apples.\* I ate one, then another, and then a third one, then waited to see what Nature said. Why, they were so mellow and rich and delicious I could not believe for a moment they would distress me, and they didn't. In the afternoon I ate three more. The next day I ate half a dozen in the forenoon and half a dozen in the afternoon. Then I ate all I wanted as long as they lasted. Now, please do not call me such names as some of you called my good friend Terry when he ate so many strawberries. Nature was calling for just what my digestive apparatus and physical system in general lacked; and when she got hold of the thing she craved she just in her own way said so, and said, as well as she knew how, "Pass it along, a good lot of it." The constipation let up at once. Every thing got into natural channels, and I felt like swinging my hat and giving a big hurrah, and then using my muscles for chopping wood or doing something useful. Now then:

God did not intend us to use pills, but he did intend that we should select tender, luscious fruit, and that we should use enough of it to induce Nature to perform her appointed work with regularity and thoroughness. Since the Belmonts are gone I have tried greenings, Baldwins, russets, Ben Davis, and other apples that we are likely to find in the spring, but all of them proved to be more or less indigestible. They are something like the Irishman's peach-stones.

The cold-storage building where these apples were kept is in Wellington, Ohio. The apples were worth 15 or 20 cts. a bushel when stored last fall; but they sell now readily at 50 cts. a bushel, and we retail them on the wagon at about 75 cts. Here is an opening for fruit-growers, and here is a hint, too, for those who are in pursuit of health. I have furnished this same kind of apple to my friends and relatives who have been unable to eat ordinary apples, and their verdict is just like mine. Let us now go back to free samples of medicine.

I answered another advertisement, and got a bottle of liquid (postpaid) that tasted to me exactly like brandy and good honey shaken together. Please do not lose your respect for Uncle Amos if he tells you he found it a very nice medicine to take. Along with the medicine came a free box of something to put on chapped hands or sore feet. I found the latter very good; but the medicine, I feel quite sure, had no effect, one way or the other. If this be true, how, then, is it possible for these people to *continue* furnishing *free samples*, yes, and filling our periodicals with expensive advertisements, that they may be *permitted* to furnish

\* The Belmont apple is the same thing, I believe, that is known in many localities as the "Gates" apple; and it is also very similar to what we used to call in my childhood the Golden Pippin. These latter I can remember in my grandfather's orchard. Their special characteristic was a peculiar honey sweetness just about the blossom end; and we children used to think so much of them when they were fully ripe that we devoured them core and all. How well I remember of going down cellar on a winter evening to get some Golden Pippins! Sometimes the tallow candle, held by unsteady juvenile hands, let a drop of melted grease fall on the Pippins. But that did not spoil them for the juvenile taste and appetite. Since I have grown to manhood I have procured trees and grafts of the old Golden Pippins; but of late years they are affected by a peculiar rotting at the core. The Gates (or Belmont) apples do not seem to have this infirmity; but I hardly think they are equal to the Golden Pippin. There is still another apple that, when grown to perfection, reminds me of that old Golden Pippin. It is the Vandevere.

their stuff free of charge, and postpaid besides? What is the explanation of this? Both firms I have mentioned are quoted as being worth many thousands of dollars. They are prompt and straight in their business. What is the secret of all this? How can they afford to throw away their money in this way? Why, I will tell you. If you like the medicine, and want some, it is \$2.00 a bottle, or two bottles for \$3.00. If you buy four bottles at one time they will pay the express charges to any place in the United States. They may have to give away a good many samples free without getting any thing for them; but once in a while a customer thinks he is benefited, or gets better from some cause or other, and keeps on buying. A friend of mine told me her father had used some eighteen or twenty bottles. He at first thought it was doing him good, but finally decided he was not sure it had any effect whatever. It is the old Electropoise business over again.

Take the people at large, and you will find certain impressive natures that imagine they are benefited, and hand over their money. Yes, there is a *great army* of people, perhaps, scattered through our country who stoutly insist they are greatly benefited by a humbug toy hitched to their ankles by a piece of wire. In fact, some of them are offended if you even suggest the thing has no virtue.

Provisionally I have been furnished with a most overwhelming proof of the truth of my position. You have all heard more or less about the air-ship. May be some of the readers of GLEANINGS have seen it. If you have, please write and tell me about it. There certainly is an air ship sailing about the country over our cities and villages at night time, for dozens of people have seen it and are seeing it every day. Their testimony is just as plain and conclusive as that of those who use Electropoise—yes, even more so. If you have been reading the papers you have seen the testimonials, with name, place of residence, etc., signed to it. Now, the air-ship has done us some good, and it is doing good. It demonstrates that, without question, there is this queer phase in humanity. It is scattered all about; it may be in your next door neighbor; in fact, you *yourself* may be one of the victims. Medical men and scientists had long suspected it. Electropoise confirmed this supposition. Why, bless your heart, the proprietors claim to have testimonials from a *hundred ministers of the gospel*, and religious periodicals all seem ready, or at least nearly all, to accept their silly advertisements. I have not yet learned that any ministers of the gospel have seen the air-ship. God forbid! This talk needs a brief summary. The summary is this:

Be careful, dear friend, how you let your imagination lead you into paying out good money for some worthless medicine or other trap that some worthless and swindling concern may try to push off on to you. Furthermore, be careful how you even accept samples that are furnished you free of charge. These men know what humanity is made of, and they are not wasting their postage-stamps or throwing away their money in this or any other way, you may be sure.

The people who declare they have seen the air-ship are honest, or a great part of them are honest, no doubt—at least we will try to believe they are so. Almost every town or village in our broad land furnishes one or more of these peculiar impressive people; and when the air-ship, Electropoise, or a certain patent medicine is talked about these are ready to give their testimony.

Before reaching Prescott we came down out of the mountains across quite a long level plain. This plain is called Lonesome Valley, and no wonder—not a tree, not a human habitation, not any thing except the great mountains away off in the distance. Friend Jordan told me some experiments had been made, and they felt pretty sure that sugar beets could be grown in that "lonesome" valley. They have a little rain along the latter part of the winter; and this rain, it is said, is sufficient to cause the seed to germinate; and after the plants once get down into the desert soil they will mature a crop of beets large enough, and of the best per cent of sugar, without any later rain.

There is one station in the middle of Lonesome Valley. It is called Davis; but instead of being a town or village there is not a building of any sort—not even a coalhouse. All you can see is some lumber-piles. This lumber is brought in from a sawmill away up in the mountains, too far away to be in sight. Jerome Junction has two or three buildings. Between this point and Prescott there is some very fine scenery, but none to compare with that further along. Although the turns in the railway are not quite as sharp as near Jerome, the scenery is grand and beautiful. Great rocks shoot up like needles. All you have to do is to fix your eyes on these and then watch and see how the train curves in and out around the mountains. Great mountain peaks rise up in their grandeur, and the railway seems to hover around them for an hour or two almost as if it were loath to break away from their awful presence. There was one round-topped peak that it seemed to me was in view a great part of the day. The turnings in and out, horse-hoe within a horseshoe, as I described in my last, were incessant. As the weather was mild I spent the greater part of the time on the platform at the rear of the train, drinking in the wonderful scenery before me. Skull Valley I have casually mentioned before. It is so named, I presume, because of the great number of skulls and skeletons of cattle scattered for miles around. I suppose this was caused during some season when the usual amount of rain was lacking, and the vegetation of the whole country was scorched and burned up by the terrible Arizona heat. But when we got several miles away from Skull Valley, down toward Kirkland, we found what is called a "cieneza." This is a piece of land where Nature has worked out sub irrigation, and it is just about as nicely fixed as our folks at the Experiment Station at Wooster have it in their greenhouses. It is caused by a valley or depression with an impervious subsoil, so that the water stands so near the surface of the ground that the roots of plants or farming crops will go down into it; and with the intense heat every thing just thrives wonderfully without any assistance from rain. Such tracts are found at different points all through California, and occasionally in Arizona. At one point near Tempe the ground became so wet from frequent irrigation that water stood on it the year round, and no crops could be raised until some deep canals were cut through to let off the surplus. This surplus was used for irrigating other grounds at a lower level. I climbed down into one of these canals, and saw the water coming out of the gravel like a beautiful spring.

A little further down below this clenega a river takes its source. The name of this river is the Hassayampa. I presume this is an Indian name. Most of the mountain rivers, and even towns in this locality, are called by Indian names, and I am glad of it too—if for nothing else, to keep in memory the existence of the red man. Well, there is an ancient Indian tradition that whosoever drinks of the Hassayampa River can never tell the truth again afterward. Some of my friends cautioned me, and declared that they had known people who had drank of this water who could not tell the truth, even when they *tried* to; and I am really afraid I have seen a few people affected this way who never even *saw* the beautiful Hassayampa. Now, I pledge my word and honor, dear readers, that I did not taste a drop of that magical water. I stood on the car platform and watched the river in its windings; admired the gorgeously painted cliffs and beautiful scenery all along its tortuous course; but I did not drink any, because—I did not have a chance.

In passing through these deserts and over these mountains, for the most part so uninhabited, one begins to wonder if people can really live and be happy amid such wastes; but when it comes dinner time, and the train slows up beside some unpretentious building or dining-station, you look about you in surprise to see a wide-spread table, with roast turkey, and vegetables and fruits to match, almost in keeping with a city restaurant. Yes, there are neatly dressed obliging women to wait on you besides, and the price of the dinner is not extravagant either.

I was so much interested in the wonderful things about Jerome a good many told me I would have to visit Congress; but I decided that *one* gold-mining town was enough for me. I was considerably interested, however, in a white-looking village off from the railroad a piece, up in a mountain canyon, which I was told was called Fools Gulch. It puzzled me at first to know whether it was really a village or a cluster of wigwams made of cotton sheeting. I am told they have there all sorts of dwellings unless, may be, it is a three-story brick. The houses are of all sorts and sizes, but they are mostly made of cotton cloth. Even the "Grand Hotel" has no cover, or walls either, thicker or more expensive than sheeting.

All around in this locality the one topic is mining. A man got on the train at a little station. As he was a resident of the vicinity I asked him some questions, and the subject of bees came up. He said his business was that of recovering gold from the ores by what is called the "cyanide" process. I believe he had an invention along that line. He said when he first built his vats in the open air, to hold the cyanide solution, the wild bees came in great numbers to the vats because the vats made such a convenient place for drink. In the desert, bees go miles for water. The cyanide, as you know, is a deadly poison. Said he: □ □ □ □ "Now, stranger, you may not believe it; but when I saw I was going to poison all the bees in the country I felt a good deal troubled. Pretty soon, however, they seemed to 'catch on' to the fact that every one of their comrades that drank at those vats soon turned up his toes. In my work I have just *one* vat of pure water, and the bees in a very few days abandoned the cyanide-vats entirely, and now they drink regularly, thousands of them, at the vat containing pure water, and nowhere else."

Now, you need not suggest that this man had been drinking of the waters of that enchanted stream. I think he told the truth, but

I rather suspect his deductions were not exactly correct. The bees probably discovered that cyanide is not very palatable, and so settled down finally to the vat of pure water, just as they choose a drinking-place where *salt* water is furnished, rather than the other kind.

At just about sundown the train drew up at the station of Phoenix. I pumped up my wheel, and was soon flying over the limestone road where I started out before daylight just two weeks before that. My brother's folks were rejoiced to see me, tanned up like an Indian. The allotted time for my vacation was up, and I very soon hustled back to old Medina, arriving exactly in the *middle of January*, and you know how it turned out.

## OUR HOMES.

---

---

Inasmuch as ye did it not to one of the least of these, ye did it not to me.—MATT. 25:45.

Dear friends, I suppose you have all read more or less in the papers in regard to the starving millions in India. Yes, it is *millions* who will doubtless starve unless they have aid. There are some people who will say, I presume, "Well, what is that to us?" "We have all we can do to take care of our own people," etc. But here lies the difference between Christianity and no Christianity. The gospel of Christ Jesus admonishes us to love our neighbor as ourself; and it further teaches us by that beautiful parable that our neighbor is anybody who is in want—starving, if you choose. Even though he may be on the opposite side of the globe, he is our neighbor still. It has been estimated, and generally published, that a dollar of our money will, as a rule, carry one of those starving people through the season so as to save his life, in all probability. There are something like three and a half millions who will be likely to starve unless they have help. Three and a half millions of dollars would save them. That is an awful big sum to send away to starving heathen, as some term it, I know; but we have single individuals in this country who alone are worth enough; at least they have control of sufficient funds to do the work. I can not refrain from adding, "More's the pity." This expression may not be good grammar, and it may be slangy, but it expresses the matter. From my point of view it does not seem as if one person ought to control such an amount of money. Never mind; we are not going to discuss political economy or social economy just now. Let us give nourishment to the starving millions, and settle the other questions afterward. Of course, we are not called upon to perform impossibilities. We are not expected to starve or neglect our own children in the effort to feed those in that far-off country; but it does seem to me that God calls on each and every one of us to be careful about extravagance and luxury.\* In our town it is quite fashionable to have various kinds of socials and clubs and gatherings in the evening, and they have expensive suppers and banquets. I have never attended more than one or two of these. In Rootville we all have a good supper at home, every night the year round, and I *always* thank God for my part of it, not only in words when I ask a blessing at

\* Since the above was in type I have found the following in a recent number of the *Chicago Advance*: "In view of the woes and adversities of the poor, no condemnation can be too severe for those rich men who make needless ostentation of their wealth, no matter how honestly gained."

the table, but from the bottom of my heart. I am well and strong now, and enjoy my daily food; but I do think it is wicked to get up expensive suppers, and more wicked still to partake of them *after* we have had a good one at home. I would save the money that these suppers cost, and give it to starving India. Why, one's *conscience* ought to keep him awake nights, even if the unwholesome food at an unreasonable hour does not do it. The saddest part of this whole foolish fashion or craze is that it is mostly done by *Christian people*. Yes, our churches—a great part of them—seem to encourage and foster this feeding of people who have already been *well fed*. The laws of health and the laws of God should protest against it.

Now, this is only *one* of the things that occur to me that we might cut off in order to save suffering and avoid the loss of life. There are things we do not need—things we should be better off without—that most of us are paying money for. We profess to be followers of Christ Jesus; and in our text he himself makes the startling statement that when we are leaving these people to suffer and die for want of food we are leaving *him* to suffer and die. Humanity nailed him to the cross, even after he left his heavenly home, and came to save a suffering and sinful world. We of this age claim we have nothing to do with this act of his crucifixion; but if we leave these people to starve while we are ruining our health in consequence of the great plenty around and in our homes we are neglecting and ignoring the very first principles of Christianity. Our own government, in a Christianlike manner, has agreed to move 4000 tons of corn or other food from New York to India, free of charge; and this makes me feel glad, because in it there is a glimpse that, with all our faults, we are in some respects a Christian nation. The *Christian Herald*, 160 Bible House, New York, seems to be pushing this matter with more vigor than anybody else. T. Dewitt Talmage is in the field, and seems to be taking the lead, and appeals are coming through all the papers.

And now, dear friends, for humanity's sake and for Christ's sake shall we not each and all of us look about us and see what we can spare, and that, too, without very seriously depriving ourselves, that we may help just a little poor famine-stricken India? A human life for only one dollar, or a dollar's worth of something you have to spare!

And that is not all. Jesus' ministry was not altogether preaching. He healed the sick and fed the hungry. America has the greatest opportunity to heal the sick and feed the hungry, perhaps, she ever enjoyed. Corn and other food supplies are in such great abundance that the prices offered hardly pay the cost of production. Our missionaries are on hand already organized, and prepared to feed the starving. There is an opportunity before them such as the world never saw before to gain the confidence of the heathen, to glorify the God of our fathers, and to proclaim the gospel of Jesus Christ to all these ignorant and benighted people. A few days ago Rev. W. E. Rambo was here on a visit from the famine-stricken region. He looked over my high-pressure gardening, and said something like this:

"Mr. Root, your high-pressure gardening is the thing of all things that is needed in India to ward off these terrible famines. If these people knew—if they were once taught—how much good nourishing food can be grown on a little patch of ground, our famines would be ended. They need to have reservoirs to store up the water in time of floods. They need

irrigating-canals to spread the water over the ground. They need to be taught *intensive gardening*."

Now, these people have been backward in accepting our teachings. In China they tore up their one railroad and demolished the locomotives, and, if I am correct, these very locomotives might have saved most of them from starving a few months later on. Now is our opportunity to *teach* and *preach* successfully. That you may not think I am talking about something that does not come within the province of bee-keepers, permit me to submit the letter below from a constant reader of GLEANINGS:

#### A LETTER FROM A READER IN STARVING INDIA.

GLEANINGS has been sent to me for years. I can not forbear writing you a few words as to the sad times that have fallen on India in these last days. Plague on the west of the peninsula and famine over at least one-third of this empire of 300 millions. The plague has done no such damage to life as the famine, but it has caused untold damage to business, and has carried away about 15,000 lives. Three-fourths of all the cases that have been smitten with the disease have died, and all medical skill seems so far of little use. By famine, already in the last few months, about 200,000 have perished of hunger, and at the present time about three and a quarter millions of persons are being fed on famine-relief funds. Of these, one in five is in a state of helplessness, and is in what are termed hospital camps. The famine is not at its worst, in these parts; but the distress is now closing down on the poor, and the next few months are full of dread for thousands about us. We are in a forest part of the country, and the forest produce has kept the people on a kind of food, that answers for the time, some six months longer than the people in the open country could pull on for. Now, even this is fast coming to an end. *Many* in the villages about us are now living on exactly what the wild swine do—that is, on roots, wild yams, berries, flowers, herbs, etc.

Recently I felt that I could not tarry to do something for the poor near by, and so, on a village that I secured for the mission a few years back, I marked out some work in the shape of a dam for the storage of water when the rain comes, and gave a lot of the poor work at very low rates—\$1.00 per 1000 c. ft. I had no funds; but a friend lent me some, and about 100 people are at work. They represent families that number perhaps 500 souls. The work will give about \$1000 in work, and help to pull through, to the time of the expected rains, 1000 souls. We get our regular rains in June; and the thought that rain may not come then is too terrible to contemplate.

All the seed grain has been eaten up; and when rain comes the condition of the people is one of great helplessness. They must be helped then. When I saw your note to-day I thought that some of the bee-men of America might be moved with pity for the distressed of this land, and that you might put some note in your journal that would give them a chance to send them something through you. It may seem incredible, but millions will not get one dollar's worth of food per person in the next three months, and yet will live; \$500 will help us to keep 500 souls here out of the reach of starvation for the next three months.

I have read for years in GLEANINGS what leads me to think that you are Christian men, and thus dare to hope that this plea for the poor heathen of India will not fall on unsympathetic ears, though this writer be an utter stranger.

I have been over 20 years a Methodist missionary here in India, and expect to spend all my remaining days here in the Master's work.

I am an Illinoisian by birth, and all my people still live near Bloomington, Ill. My family are at present in Wheaton, Ill. My wife left India, broken down, in '94, and I expect her and the children back here this year. If you wish any reference to satisfy you as to who I am, I will refer you to Richard Grant, Esq., 181 Hudson Street, New York, or Anderson Fowler, Esq., Produce Exchange, New York. Twenty years have I given to the Lord's work in this land, without salary from any missionary society. I have trusted the Lord and his peo-

ple, and what the Lord has sent me; and what I have been able to earn has supported me and mine, and a great deal of work for the Lord. To this sort of work and life my wife and I are pledged.

In closing, let me ask you to continue GLEANINGS. And if the Lord move your sympathies on behalf of the suffering here, I hope you will speak the word to your friends through your journal, and pray that some help may come through you to the suffering here. *I am not in need, nor are my Christians; but the poor heathen, who know not God to cry to, need your prayers and sympathy. God is full of mercy, and these famine and plague voices are his, and as full of mercy as any ever sent to the perishing.*

C. B. WARD.

Yellandu, Nizam's Dominions, India, Mar. 25.

Let us now come back to our country, and read a letter from a brother bee-keeper who seems to preserve a very cheerful spirit, even although he has had terrible trials and losses: ]

A SAD STORY FROM ONE OF OUR BEE-KEEPERS WHO HAS SUFFERED FROM THE FLOOD.

*Friend A. I. Root:*—I am sitting in our humble domicile, not able to leave our door unless we go in a boat. Our stock is standing on the levee, in front, fighting the buffalo gnats; the younger of the family out there trying to keep the gnats from killing horses and cows; the water at our door is 28 inches deep. What bees we saved, some 30 colonies, are up on stilts, hurriedly made when the levee broke some five miles north of us. We lost some 200 head of hogs, but have saved horses and milch cows so far, though they are getting very poor. We feed them all we can; but being about out of feed, we are cutting and boating to them green willow and cottonwood to try to save them. The river is falling a little, but very slowly—about one or two inches in 24 hours. It looks very dark about making any crops in this vicinity. The levee is crowded with horses, mules, cattle, and negroes, driven from their homes by the worst flood we ever had.

I said the water is 28 inches deep in our dooryard; but it is much deeper in most of the town. On the main street, on which are the court-house, postoffice, and most business houses, it is from 5 to 8 feet deep. All business is suspended; no trains here in 25 days. The levee broke on the last day of March, and we were flooded in a few hours. I saw Mr. Diver, and he tells me he lost all his bees, as did Sydes at Gun-nison, 8 miles north of us. When our bees swarm, which they have been doing, we have to let them go, can't save them. This is a gloomy picture, but not nearly as bad as it actually is.

There have been several persons drowned, and a great amount of stock; in fact, the stock are still dying fast after being gotten out on scaffolds and the levees. I guess there are 200 or 300 head dead within less than a mile of Rosedale; and, to make matters worse, they have the measles among the people, and some are dying from that cause. I have received but one copy of GLEANINGS since the water got us.

R. J. MATHEWS.

Rosedale, Miss., April 26.

#### CULTIVATING PLANTS AND CULTIVATING BOYS.

Right over in the greenhouse across the way I noticed yesterday, April 27, a good-sized bed of Earliest in the World tomatoes that were getting crowded. In fact, the whole seemed all at once to have got to the point where they were discussing "who should be tallest." With the present fine weather they would be two or three inches taller than I want them, in 24 hours or less. They must be moved. Fred and Frank were busy filling orders for potatoes and other stuff that had to go at once. Mr. Green was superintending the boys planting half an acre of strawberries. I felt as if I could not

have those tomato-plants in that rich soil one day longer.

Pretty soon school was out, and three bright earnest boys were ready for a "job." There was a bed already made, ground tined up and nicely leveled off, and even marked for the plants, 7 inches apart from center to center. The boys would take up the plants and set them out in the bed, without any question, if I asked them to do so, *without* any instruction; but they would get the dirt all off the roots, and would probably make other blunders, and my beautiful early plants, growing so nicely, would be injured, and many of them killed. If I could be with them for fifteen or twenty minutes I was pretty sure they would do it almost if not quite as well as some expert men. The boys were from thirteen to fifteen years of age. I called them.

"Here, Carl, you get every thing ready to put out those tomatoes. Have a couple of bars to stand on; and here, Clyde, you take the hoe-handle dibble\* and make the holes just large enough for the plants that Carl is going to set out; and, Clare, you come with me. Bring along two trays and a trowel." Clare has not had as much experience in gardening as the other two, but he is a skillful boy when he knows what we want.

I showed him how much water to give the plants, where to place his tray, how to handle his trowel, and then held up a plant with a ball of rich black soil hanging to it, say as large as a good-sized hen's-egg. I took up three or four, placed them on the tray, tops all one way, and told him to try it. He soon had a dozen on the tray very nicely. Then I called Clyde to take the tray over to Carl. Carl lifted the plants so carefully that little if any of the dirt tumbled off—set them down in the holes widened out with the hoe handle dibble, and pressed the earth close around them. When he had got out the dozen, Clyde carried back the empty tray and swapped it for a filled one. While he was gone I carried the hose over to where Carl was putting the plants in, and opened the valve just so as to give a small stream. Then Carl let enough on to each plant, without wetting the foliage, to get the roots well soaked. After I had instructed each boy just how to work I watched them for five or ten minutes and knew they would do it all right. In two hours over 500 plants that were crowding and struggling for more daylight were put outdoors and moved from three inches apart to seven. As fast as Carl got a row of plants in, one of the light board shutters was laid over them, and moved along so as to cut off the sun. The plants stand up this morning, April 28, just as proudly and gracefully as they did in the greenhouse; and, shaded by the shutters during the heat of the day, I do not expect a leaf to wither or even scarcely to droop.

Now, friends, when plant-raising can be made to go along like clockwork, and have all the plants live, it is one of the nicest things to work at in the world. But when you do your work bunglingly, and have failure after failure, I do

\*I will explain that our hoe-handle dibbles are made from any hoe that gets broken off at the shank. We have the blacksmith heat up the shank and draw it down to a blunt point. While doing this he keeps the handle of the hoe wet so it will not burn; then it is finished up with a file or emery wheel, and kept polished and bright. Instead of having to stoop over, as you do with short handled dibbles, the operator stands upright, and makes the holes almost as fast as he can walk along. In using this dibble in our plant-beds (rolling it as it goes down) the operator stands on one of the wooden bars laid across the bed, for we never set foot on the ground in the beds at all.

not wonder that people call growing plants a pattering small business, and want to get out of it.

There, I declare! I almost forgot my heading. While you are succeeding with the plants you are also succeeding in training the boys. The boy who can successfully perform the operations I have described, and have his plants *all grow*, is pretty well fitted to do other important business in life. For instance, without the careful instruction I gave them they would probably have taken the plants out of the greenhouse, without watering, and rattled all the dirt off. They would have laid them on a tray or in a basket with the delicate tender tops bent or broken. In watering, if I had not cautioned them and showed them how to do it they would have turned on a flood of water and washed out the plants and knocked them over, besides spattering their clothes and making the paths a sloppy muddy place. As it was, they did not soil their clothing nor the plants. I like to see plants grow and thrive; but, dear friends, I hope I am speaking truthfully when I say I try to recognize every day and every hour that it is of a thousand times more importance that these boys should grow up careful, trustworthy, successful, obedient boys than it is to grow the finest fruit or vegetables that the world ever saw. God gave us the fruits and the vegetables, and they are indeed a precious gift; but Christ Jesus himself came down from his home in heaven, into this world, and lived—yes, *died*—that the boys might have *life eternal*.

#### THAT "EARLIEST" STRAWBERRY.

□ A few weeks ago I spoke about the above strawberry, and alluded to the fact that it was putting out blossoms before any other we have on our grounds, say a week or ten days earlier than Michel's Early, Rio, or any other of the extra earlys. As soon as Mr. E. C. Green saw it he said I would find it had the same fault as Michel's Early—that it makes a great swamp of plants but bears very few berries. Pointing to one of the plants he remarked:

"There, you see those runners coming out already along with your extra-early blossoms."

The plant now has runners a foot long; but each and every plant seems to have stopped the blossom business, and commenced putting its energies into runners. Very likely this is a fault of most of the extra earlys.

#### "THE BREED WEEDER AFTER HEAVY RAINS."

■ After having written my enthusiastic notice on page 353, last issue, we had a heavy soaking rain which settled our clay soil down so solid that it threw the weedeers out for some days. Before the soil was really fit to run the weedeers again, we had a rain lasting three or four days; and now the weeds have got such a start that we are obliged to use the cultivators instead—at least until we get the ground lined up once more in proper condition to use the weeder. At the time I wrote I had a little misgiving, and therefore I used the expression, "This morning I feel like calling the Breed weeder the greatest invention," etc. We can with some trouble get the ground in proper order to use the weeder again; and on certain soil, say on muck land or sandy ground, the weedeers can be used almost as soon as it stops raining. Our ground is very thoroughly underdrained; but notwithstanding this it takes some time for the water to get away; and after a heavy rain it is apt to leave a crust that the weeder can hardly break up. Where we have made heavy applications of stable manure season after season this remedies the defect in a great measure.

Below we give you a cut of the Breed weeder, made especially for onions and other small stuff where there is not room for a horse between the rows.

BREED WEEDER FOR ONIONS, ETC.

□ We use the above mostly with two boys. One of the boys pushes, and the other pulls on a small cord hitched to the front. This cord he puts under his arms and over his neck so the draft comes just a little above the waist. Both boys either straddle a row of the plants or else go between the rows. They are expected to keep the wheels and their feet off the plants. Where the onions are of proper size we run crosswise of the rows as well as lengthwise. In this case the wheels bend a few plants over; but the harm this does is more than counterbalanced by the more perfect pulverizing we get. Where we use boy power instead of horse power these weedeers can be run crosswise on all sorts of crops as well as lengthwise. Good results are obtained by going crosswise at one time of cultivating, and lengthwise the next.

#### "EARLIEST IN THE WORLD" TOMATO.

We clip the following from *Horticulture* for March:

I have just inspected a patch of the "Earliest in the World" tomato, in the garden of an acquaintance in Ontario County, N. Y. It was a sight indeed. All plants were trained to a stake, and trimmed to one stalk each. There were immense clusters, from five to seven specimens in a cluster, all of good, singularly uniform size, and as smooth as an apple, not a wrinkle to be seen in any of them, and evenly colored. My friend claims to have left the specimens unpicked, on some of the plants, until about half of the crop had become fully ripe, and then to have picked as much as half a bushel of perfect ripe fruit from one plant, leaving about as much green fruit on to mature later. This would prove unusually good keeping qualities, too. The plants were seven feet high and upward. Of course, we can train any tomato up like that. When all the growth is forced into a single stem, on rich ground, we can run the plants up 10 or 12 feet high easily enough. From the great thrift of the plants in my friend's patch, I infer that growth has been stimulated by heavy manuring, possibly with liquid manure, and that this treatment may possibly account for the remarkably fine fruit and the great productiveness of the plants. It points out a way how to get fine tomatoes, and plenty of them.

Half a bushel from one tomato-plant, of perfect ripe fruit, is a pretty big story; but I shouldn't wonder if we gathered a good half-bushel from some single plants on our grounds last year, and they were left to sprawl about just as they chose. I was astonished to see so many tomatoes, each and every one "as smooth as an apple." While reading the above it made me feel glad to think we have a tremendous big planting in our plant-beds, of this same variety, both once and twice transplanted. We also have plenty of seed of our own saving, for those who care to plant the seed as late as this. Very nice tomatoes may be grown even now by planting the seeds in the open ground.

#### KILLING APPLE-TREE BORERS WITH BISULPHIDE OF CARBON.

Bisulphide of carbon will surely kill trees if applied to them. Prof. Stedman, entomologist of the Missouri Agricultural Experiment Station, at Co-

lumbia, Mo., and also Judge Wilkerson, horticulturist of this State, made repeated experiments of injecting bisulphide of carbon in the ground around the roots of apple-trees for the purpose of destroying the root-louse, or woolly aphid, and in every case where the bisulphide came in contact with the roots of the trees they were killed.

A full report of these experiments is contained in Bulletin No. 35 of Missouri Experiment Station. I enclose a clipping from Prof. Stedman in regard to keeping borers out of fruit-trees. These wooden wraps are made to encircle the tree, and are for sale by a St. Louis firm who deal in berry-box material.

WM. H. COMBS.

Will you give a subscriber whose orchard is infested with borers a way to keep trees from the attack of this destructive enemy? J. A. H.

Marshfield, Mo.

#### REPLY BY PROF. STEDMAN, COLUMBIA.

There are two well-known methods by means of which one may prevent a large percentage of the injury from apple-tree and peach tree borers. The first (and for some reason the best) method is to surround the base of the tree with a wrapper of some sort. For this purpose a common newspaper is frequently used; but where wire mosquito-netting is too expensive one would do better to purchase common wooden wrappers that can be obtained for about \$3.00 per 1000. These should be loosely placed around the tree, and pushed into the earth just enough to prevent the insects from crawling under; and the tops should be closed up with cotton to prevent the adults from crawling down between the wrapper and trunk of the tree. These wrappers will also prevent rabbits from injuring the trees. The wrapper should be about eighteen inches high.

The other method is to apply a wash to the trunk of the tree. This wash is to contain some substance that is unpleasant to the insect and will cause it to seek trees not so treated. For this purpose carbolic acid is more often used, and the wash varies in the other ingredients. The simpler the wash, however, the better in most cases. A good wash is made as follows: Two ounces of crude carbolic acid is laced in one bucket of water, and one-half pound of sulphate of iron dissolved, and the whole thickened with lime to make a thick whitewash. This is applied to the trunks of the trees by means of a whitewash brush, and is usually effective when so used in the spring, and again later in the summer or early fall.

#### THE CRANDALL "TREE" CURRANT.

I paid Frank Ford one dollar for one root of the above currant the first year he sold them. Late in the season I was at his place at Ravenna, Ohio, and saw his beating bushes. They were all he represented as to prolific bearing. As it was necessary for me to move my bush several times it never had a fair chance; but one or two years it has had a fairly good crop. As to the "tree" part, it is no more a tree style than any other currant or gooseberry bush, only as it is trimmed to represent a tree.

#### THE JAPANESE MAYBERRY, THE STRAWBERRY-RASPBERRY, AND THE LOGAN OR RASPBERRY-BLACKBERRY.

I got some of each of the above last spring. All were very small, in two-inch pots. Of the four strawberry raspberry, all lived and made a good growth; one set two blossoms in August. One blossom amounted to "nix," the other set and matured one seed. They have come up very thickly this spring, each original plant filling a space of two feet in diameter. One entire plant I dug up and divided into 125. They sucker from the roots, like the red raspberries, and very freely too. My three Golden Mayberries grew to average about 15 inches high, and quite branchy, but winter killed about to the ground, but are sprouting nicely now.

My one Logan made one branch 6 feet, and one 4 feet, the tips of which I put into the ground.

I will give reports on all next fall.

Brooklyn, O., Apr. 19.

A. A. FRADENBURG.

#### A GOOD WORD FOR THE WHITTAKER ONIONS.

The White Multiplier onions, set last fall, were almost a failure—only two or three surviving, set same time and manner with my common potato

onion. The winter was very hard on onions, however, the very warm autumn bringing them up to 6 or 10 inches in height; then the January freeze, down to 16 degrees below zero, took them. I expect to lose all. The Whittaker, however, stood the test, and are the best-looking onions I have.

Rugby, Tenn.

M. S. PERCIVAL.

The Whittaker onions have wintered again with us the best of any we have ever had except the winter Egyptian. Our stand this spring is regular and complete; and they make the largest onion early in the season (far ahead of the American Pearl in size) of any we have ever got hold of. Your experience points a caution. If onions to be wintered over outdoors make too strong and rank a growth they may not winter as well as those planted later. With us the best time for American Pearl, Whittaker, and White Multiplier seems to be just about the time farmers are sowing wheat, or, say, with the late sowing of wheat.

#### NEBRASKA CORN, MUSHROOMS, ETC.

Our Homes is read with much interest, and also your travels and Ernest's. In April 15th issue it seems you do not exactly understand our western way of corn bushels; 56 lbs. of actual corn is a bushel if it is shelled; in early gathering (before the corn is dry), 80 lbs. cob and all; later, as the corn and cob become dryer, 75 lbs per bushel; and after about Christmas it is called seasoned; and from that on to 70 lbs., cob and corn go as a bushel. Our to-day's market here is, corn, 17 cts.; oats, 15; hogs \$3.75 to \$3.80; but the cholera took nearly all last fall and winter, and so the corn must be sold at some price. The winter has killed most of the wheat. There will not be nearly enough this year to seed us.

I think if you were here I could feed you on mushrooms that are not poisonous. They are not the shape of a toadstool, but more like a corncob, point end up; in length from 1½ to 5 inches, and diameter ½ to 3 inches. They grow under or near dying apple or oak trees. Yesterday I picked 80 on less area than 16 feet in circumference, under one tree.

M. W. MURPHY.

Cuba, Ill., May 4.

## Health Notes.

#### WHEAT FLOUR CONTAINING A LITTLE RYE, ETC.

Your Notes of Travel are very interesting to me, especially those from the thinly settled country through which I have been traveling. We find but few places for any distance without some settlers far or near. What surprised me the most of any thing all over the Rocky Mountains is how they make their living. In some places indeed it is a mystery until you get acquainted with their occupation. Of course, they live more simply, with fewer luxuries and less high style than is fashionable in thickly settled places. Their common food, as a rule, keeps them in good health and spirits, while we live too finely and luxuriously, as well in food as in clothing.

This cracked wheat surely beats the lean meat and hot water all to smash. I believe a little rye mixed with the wheat will make it still better for many people. The other day I rode on the cars with a baker. In our conversation I told him that I had about 400 bushels of wheat, with a little volunteer rye in it, which is rejected by wheat-buyers. I got part of it ground for flour, which we use for our family. We like it better than clear wheat. This baker will buy all I can spare. He told me he had regular customers for such bread—those who are costive naturally—and this bread regulates their system.

C. THEILMANN.

Theilmanton, Minn.

Friend T., no doubt the cracked wheat and rye will do very well with many people, without the necessity of lean meat; but where one is badly out of health I would advise him to adopt the lean-meat diet, using just enough of the cracked wheat or rye, or both, to avoid the ne-

cessity of using physic. A great many of us, probably, can get along very well without the lean meat. In that case we should thank God that we are more fortunate than some other people.

## A Dollar Saved

is better than one earned. Read my 37th annual catalog, and don't send out West for goods you can buy cheaper here at home.

I have added 2400 feet of floor-space to my store-house and shall keep in stock Root's polished one-piece sections. Dovetailed hives, new Weed foundation, etc., in addition to my old line.

Best breeds of bees and queens at bottom prices. Don't buy until you see what you can do with me.

W. W. CARY, Colrain, Mass.

## Our Prices are Worth Looking at!

IN THE

### New Champion Chaff Hive Especially.

All other supplies accordingly. Send for catalogue and price list. Address, mentioning GLEANINGS,

R. H. SCHMIDT & CO., Box 187, Sheboygan, Wis.

### MUTH'S HONEY-EXTRACTOR, SQUARE GLASS HONEY-JARS, ROOT'S GOODS AT ROOT'S PRICES,

Bee-keepers' Supplies in general, etc., etc. Send for our new catalog. "Practical Hints" will be mailed for 10c in stamps. Apply to

CHAS. F. MUTH & SON, Cincinnati, O.

"WATCH POWDER'S AD"

### SEE THAT WINK? BEE SUPPLIES.

Root's Goods at Root's Prices.

Pouder's Honey Jars and every thing used by bee-keepers. Low freight rates; prompt service. Catalogue free.

WALTER S. POWDER,  
162 Mass. Ave., Indianapolis, Ind.

## One Cent

Can save you money.

Invested in a postal card will get my large catalogue of all Root's goods.

M. H. HUNT,  
Bell Branch, Mich.

## Tested Queen

for 90 cents; untested, 65 cents. One frame nucleus, 65 cents; 2-frame, \$1.10. Discount on quantities. Send for circular.

Cooper & Gillett, Quebec, Tenn.  
Money-order office, Sparta, Tenn.

\$ \$ \$ \$ \$ \$ \$ \$

are lost by keeping old and poor queens. It pays big to replace them with young vigorous ones early in the season, and get a crop of honey with little swarming. I have now untested queens—either light or dark Italians—single 75c; 6, \$1.00; 12, \$1.50; tested, \$1.00 up. Guaranteed to arrive safe at your office, and to be good queens, or replaced free. Remit by M. O. Send for catalog free for particulars.

## Are You Going to Buy

### Apiarian Supplies or Bees?

If so, You Want the Best.

This is the only quality we offer. Our prices are right, and our '97 catalog describing them, and the management of bees, is yours for the asking.

We carry a large stock, and can ship promptly. Freight is a big consideration often amounting to 20 per cent of the value of goods. Let us quote you prices on what you need, delivered at your station.

## Freight Paid.

They will cost but a trifle more than others charge at the factory. Our aim is to please.

Apiary,  
Glen Cove, L. I.

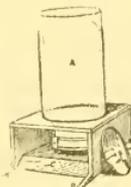

I. J. STRINGHAM,  
105 Park Pl., N. Y. City.

## Don't Neglect Your Bees.

Bee-keeping may be made uniformly successful by judicious feeding. It is just as important with bees as with other stock.

Success in feeding depends very much on the feeder used. When you have tried the

### Boardman Atmospheric Entrance-feeder

you will be convinced of this.

For descriptive circulars and price list, address

H. R. BOARDMAN, East Townsend, Ohio.

## Dovetailed Hives.

Sections, Extractors, Smokers, and every thing a Bee-keeper wants. **Honest Goods at Close Honest Prices.** 60-page catalogue free.

J. M. JENKINS, Wetumpka, Ala.

## Look Here!

Do you need queens? The purest and best. If so, we are prepared by return mail to ship the 3 band and golden Italians, and silver gray Carniolans, untested, warranted purely mated, for 50c; tested, 75c; breeders, \$2.25.

JUDGE E. Y. TERRAL & CO., Cameron, Texas.

## Just Arrived!

My second carload of goods from The A. I. Root Co. has arrived, and I am in shape to fill all orders promptly at their catalog prices. Send for my 36-page catalog; also send a list of what goods you will need, and I will make you special prices on early orders.

GEO. E. HILTON,  
Fremont, Mich.

## FOR SALE. The Great French Strawberry,

"LOUIS GAUTHIER."

The only large fruiting kind that bears on young runners. Old plant fruits in June, making runners which fruit in September. Write for particulars.

ARTHUR T. GOLDSBOROUGH,  
West Washington, D. C.

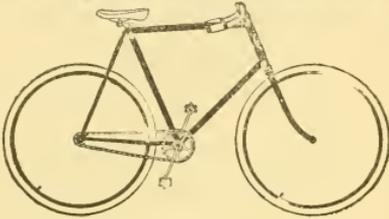

## Queens.

Either Golden or Imported by return mail. Untested, 75c; Tested, \$1.00; Breeders, \$2.00. None better.

NO. 2 SECTIONS, OPEN 4 SIDES.

Our friends who order No. 2 sections will, some of them, have to be disappointed unless they can use them open 4 sides. There are very few places where a section open 4 sides will not work just as well as the regular open-top-and-bottom sections. Over in Europe they use at least twice as many sections open 4 sides as they do of the 2 openings. We can supply the No. 2, 4 openings, 2 inch, 1 1/2, 1 3/4, and 7 to foot. When you order No. 2 grade, let us know in order if we may send the sections with 4 openings provided we are not able to supply those with 2 openings in No. 2 grade. If you order from any of our branches or wholesale dealers, advise them as well, if you can use those with 4 openings.

BUSINESS BOOMING.

We never had quite such a run of orders as we are having this spring. If we were no better organized for taking care of so much business promptly than we were in 1896 we should be hopelessly behind. As it is, we are working a man in every available place; and in the wood-working department two turns of workmen keep the machinery going 22 hours out of the 24. In the shipping department there are several who are working 14 or 15 hours almost every day to get orders off promptly. By these extra efforts we are able to keep the goods going out as fast as the orders come in, so that orders do not remain in our hands unfilled very long.

We have shipped a carload of 420,000 sections and numerous other goods to M. R. Madary, of Fresno, Cal., who is the principal supply dealer in Central California. Another car has gone to Buell Lauberson, Portland, Or., our agent for Oregon and Washington. Two carloads, the fourth and fifth for this season, to Jos. Nysewander, Des Moines, Ia., have been shipped since our last. We have also shipped one to our Chicago branch, and are loading another for same place as we go to press.

We have also shipped the ninth car for export for the season, this one going to London. Wm. Boxwell, of Patrickswell, Co. Limerick, Ireland, is our wholesale representative for the British Isles. He has stores 1. London, Liverpool, and Glasgow, and has had five carloads of goods of us this season.

Special Notices in the Line of Gardening, etc.

By A. I. Root.

SWEET-POTATO PLANTS.

As we now have an excellent stock we will make the Yellow Jersey and Early Peabody, 25 cts. per 100, or \$2.00 per 1000; either of the vineless sweet potatoes, bunch yam, or General Grant, as you choose, 40 cts. per 100, or \$3.00 per 1000. If wanted by mail, add 25 cts. per 100 for postage and packing.

BEEF SEED FOR MAKING SUGAR.

We are finally prepared to furnish the very best, giving the largest per cent of saccharine matter, and the kind most generally used for the purpose, at the low price of 15 cts. per lb.; 5 lbs. for 60 cts.; 10 lbs. or over, 10 cts. per lb. If wanted by mail, add the usual 9 cts. per lb. extra for postage and packing. We have two kinds.

HAVE YOU GIVEN ALL YOUR FRUIT-TREES A THOROUGH SPRAYING?

Our apple-orchard, and, in fact, all of our fruit-trees, were thoroughly sprayed when the leaves began to show. Then they were thoroughly sprayed again just before the blossoms began to open. The spraying was done with the Bordeaux mixture, with 1/4 lb. of Paris green in every barrel. We not only gave the new leaves and blossom buds a thorough drenching, but we took pains to make the solution run down the limbs and trunk of the tree. The latter I regard as specially important. The limbs and body of our fruit-trees are very perceptibly

improved since we began this thorough spraying. The trunks are clean and smooth, and the wood has a thrifty, healthy look. Our currant-bushes were given the same treatment. We expect to spray them two or three times more after the blossoms have fallen. You need not be afraid of rain unless it should wash off the mixture before it gets dry.

THE WET WEATHER.

I do not know how it is with you, friends, but right here we are having a tremendous time in getting our ground in condition. I have plowed one piece to get in some cabbage, cauliflower, and early potatoes when it was too wet. The teamsters scolded, and the horses remonstrated, and I made up my mind I would not try to work ground again when it was in that condition; but the condition has been getting worse pretty nearly every day since; but the cabbages and cauliflower are doing pretty fairly, even if they have not had any cultivating, and the potatoes are coming up pretty well. It is very well to say, "Wait till your ground is dry enough to work nicely." But suppose it gets to be the first of June, and you have not got any thing planted. Our Alaska peas, put in in March, are now a foot high, and we are looking every day for blossoms. The plant-beds are all booming; but that is about the only place where we can make garden at all. Never mind; there will be all the better demand for early stuff when we get it.

POTATOES TO BE GIVEN AWAY.

We still find ourselves with more or less of a stock on hand of all the potatoes in the list below, except Carman No. 3; and for the rest of the season we make every reader of GLEANINGS the wonderful offer that we made just about a year ago. Every one who sends us \$1.00 for GLEANINGS, past, present, or future, may select a dollar's worth from the table below; or you may have GLEANINGS for one year for every dollar you send us for potatoes. You can send GLEANINGS where you choose, or the potatoes either. We give the table once more to facilitate making your selection. We have seconds of only the following: Thoroughbred, New Queen, and New Craig. Of these three we can furnish seconds at half the prices below.

| NAME                   | 1 lb. by mail.                                                                                       |                | 3 lbs. by mail. |            | Peck. | kg bushel. | Busnel. | Barrel—11 pk. |    |

| Carman No. 1           | 12                                                                                                   | 30             | 20              | 35         | 60    | 1          | 50      |               |    |
| Carman No. 3           | 15                                                                                                   | 35             | 20              | 25         | 40    | 75         | 2       | 00            |    |
| Kostikonog             | 15                                                                                                   | 35             | 30              | 35         | 40    | 75         | 2       | 00            |    |
| Manum's Enormous       | 15                                                                                                   | 35             | 20              | 35         | 60    | 1          | 00      | 2             | 50 |
| New Craig              | 15                                                                                                   | 35             | 20              | 35         | 60    | 1          | 00      | 2             | 50 |

Now, even if you do not want the potatoes to plant, in many localities they are well worth the money for table potatoes at this time of the year; and if you have never tasted of a genuine Freeman, I would advise you to have a barrel of these, grown by T. B. Terry, for your table—that is, if you want something extra. At the present writing, May 11, they are, the most of them, in almost if not quite as good order as when put in last fall.

MAULE'S EARLY THOROUGH-BRED.

This, although not the earliest potato we have, is undoubtedly the best early potato so far as yield and quality are concerned. All things considered, I believe it has given us the largest yield of any potato we ever planted; and the general decision, the country over, indorses our opinion. Now, in order that everybody may have a chance to get a good start with this very valuable new potato, we make the following exceedingly liberal offer:

A BARREL OF THOROUGH-BREDS FOR ONE NEW SUBSCRIBER.

These, of course, will be seconds; but you may have half a barrel of firsts for one new subscriber.

We make these exceedingly liberal offers because we have still a large stock on hand. The Thoroughbred matures so early that you can plant them through the remainder of this month, through June, and even up to the middle of July, and still get a good yield. We hope that none of the readers of GLEANINGS will fail to try at least a few Thoroughbreds.

Our first planting of early potatoes was half Thoroughbred and half Early Ohio. At present writing, May 11, the Thoroughbreds stand head and shoulders above the Early Ohio. Very likely they will not mature the crop as early as the Early Ohio, and judging from the looks and from the experience of last year they will give a yield of about four times as many potatoes. If you have not grown any Early Thoroughbreds, by all means avail yourselves of the liberal terms on which we now furnish them to the readers of GLEANINGS.

#### THE NEW CRAIG.

While this potato does not give as great a yield in every locality as it does with us here in Medina, I believe it has generally been received with favor. It has been one of the best late potatoes, and we think its power of resisting bugs and blight is equal to any. It is also, perhaps the best potato known for making *rites* to mulch strawberries. In consequence of a large stock still remaining on hand, we make the following liberal offer on Craigs:

For every new subscriber we will send a barrel of firsts, worth \$2.50, and for every renewal a barrel of seconds worth \$1.25.

Perhaps our friends may be interested in knowing just how many potatoes we have at this date, May 15, to be given away to our subscribers. We have the following number of bushels of each kind: White Bliss, 9; Maule's Thoroughbred, 250 (also 300 of seconds); Early Ohio, 23; Early Northern, 4; Burpee's Extra Early, 4; Freeman (Terry's growing), 200; New Queen, 110 (also 120 of seconds); Monroe Seedling, 18; Rural New Yorker, 15; Sir William, 30; Carman No. 1, 30; Koshkonong, 5; Manum's Enormous, 12 (3 of seconds); New Craig, 100 (70 of seconds)—nearly 1500 bushels in all, as you will notice. All of these are to be given to our subscribers, a dollar's worth of potatoes for every dollar sent for GLEANINGS, as long as they last.

#### LETTUCE, SPINACH, AND ONIONS.

Lettuce is still retailing at 20 cts. per lb., and the demand is greater than the supply. I tell you it is fun to get a nickel for a stalk of Grand Rapids lettuce before it is fully grown. We have one competitor in our town, and he has quite a good-sized greenhouse. Both of us are sold short. We are cutting ours before it is much more than half grown, because people keep wanting it. Spinach has also brought 10 cents per lb. till just now (May 14); and real nice spinach, grown on extra-rich ground, will bring 10 cts. per lb. now at retail. Of course, our town does not furnish a market for a very large supply of either; but it is refreshing to note that, notwithstanding the low prices on most crops, we have sold more lettuce this spring than ever before, and have obtained a better price for it. I suppose that, as soon as strawberries get to be plentiful, however, people will drop off on the lettuce.

People are calling now for onions large enough to cook; but with the backward spring we have none yet quite the size of hen's eggs, and it hardly pays to pull them when they will probably double in weight inside of a week or ten days. I see onions are quoted in the cities at \$5.00 a barrel. Imported Spanish onions are somewhere about \$2.00 a bushel. Now, there is a moral right here: I have never yet seen the time in the gardening business when there were not a few things that commanded good prices, what you are to do is to be on hand with the thing that people are willing to pay a good price for. If by extra care, rich soil, thorough cultivation, and protection, you are able to get a crop a little ahead of the general run, you are pretty sure of a big price.

#### A BOOK ON RHUBARB CULTURE.

I have for some time been thinking that we ought to have a book on growing rhubarb for market; and I assure you it was a pleasant surprise when I discovered that there was such a one already. It was written in 1891 by Fred S. Thompson, of Bay View, Milwaukee, Wis. W. W. Thompson & Sons grow rhubarb by the acre. In fact, they have one plantation of several acres, and they sell

about 10,000 dozen annually in Milwaukee alone, for making pies. They also make quite a business of growing it in winter, and they even commence putting it on the market for the holidays in December.

One thing I was warned to learn was to find that, like asparagus, rhubarb must be frozen first, and then thawed out by an artificial spring or a real one before it will grow successfully. This tells us why so many failures have been reported in regard to growing rhubarb in Florida. It can be done successfully, however, by shipping roots south after they have been once frozen up.

The book contains several illustrations from photographs pertaining to the industry, that are valuable. The author says, "No reliance can be placed on the seed producing the identical variety of its parent." If this is true, what are we to think of St. Martin's rhubarb, the seed of which is offered by Pete Henderson at \$10.00 per lb.?

The book treats of two different varieties in particular—the Victoria, the kind we grow and recommend, and the Mammoth Red. This latter, from the description, we should call much the same thing as a plant introduced years ago as the "wine plant." It was to be grown for making wine; and not only were wonderful stories told in regard to it, but some of our people paid out a "wonderful" lot of money for it, only to throw it away and get back to the Victoria when they wanted good pies. I believe several made wine by the barrel; but as it was all soon dropped and forgotten, I judge it did not amount to much as a wine-plant; and, by the way, I am heartily glad of it.

This rhubarb-book contains 76 pages; price 50 cts. In fact, that is what I paid for the one I have in my hands. We have, however, made arrangements with the publishers so we can furnish it to our readers for an even 40 cts., postpaid. The author is supposed to be the largest grower of pie-plant in America. Their yearly output is something like 125 tons of "pie-timber;" and it is estimated that it takes 120,000 lbs. of sugar to sweeten up the tartness resulting annually from their plantation.

#### A NEW (?) PROCESS FOR KEEPING APPLES.

In a recent number of the *Ohio Farmer* we find the following:

##### WRIGHT'S PERFECT APPLE-PRESERVER.

I have a discovery of incalculable value to apple-growers. For the small sum of fifty cents I will send a printed recipe for the preservation of apples in their natural state throughout the winter. Fruit put away by my method will remain as solid, crisp and perfect as when picked from the trees. No rot, no shriveling. My method will not only keep your apples safe and sound through the winter, but by its use you can have them for use or market late in the spring when the fruit commands a higher price. This is no lumbing, but a valuable discovery that has been tested, and its great merit fully demonstrated. Any person putting away ten bushels of apples for the winter will save money by using my method, which is quite simple, and costs nothing. Send 50 cents for the recipe; try it, and if it does not prove satisfactory your money will be refunded. Address:

C. B. WRIGHT, Belmont, Belmont Co., O.

The readers of GLEANINGS, at least the older ones, are well aware of the position that we have taken for twenty years or more in regard to selling information, recipes, etc., for doing something. The above illustrates the point exactly. If Mr. Wright really had something valuable, why did he not sell it to the *Ohio Farmer* folks and let them give it to their readers? He offers a printed recipe. Each reader of the *Farmer*, if he wants it, is expected to send 50 cts.; and yet the whole recipe could be put in the *Farmer* and occupy less space than the advertisement. Besides, what is to hinder the first man who gets it from publishing it to the world, thus saving a large amount of money spent uselessly? We sent the 50 cts. just as soon as we saw the advertisement. Below is the recipe:

##### RECIPE FOR USING WRIGHT'S PERFECT APPLE-PRESERVER.

In storing your apples, if using either barrels, boxes, or bins, first cover the bottom with two inches of dry sawdust; then place a layer of apples, covering the same with another layer of sawdust of like depth, and so on, alternating each layer of apples with one of sawdust. Leave room at the top for a covering of six inches of sawdust. This will make the fruit perfectly air-tight, and the pre-preservation will be complete. C. B. WRIGHT, Belmont, Belmont Co., O.

I judge that Mr. Wright soon found this method of doing business was not quite satisfactory; for inclosed with the letter was perhaps half a teaspoonful of gray powder. The envelope containing the powder had printed on it the following:

TAKE NOTICE.—Dissolve the powder contained in this envelope in one quart of hot water. Sprinkle a sufficient quantity of sawdust with the solution, and mix thoroughly. The

use of the powder is essential for perfect results. The powder dissolved and used with the sawdust as directed will be sufficient to perfectly preserve 100 barrels of apples or potatoes.

Parties having already purchased a recipe for Wright's Perfect Apple preserver will send a package of the powder for use the next year on receipt of 15 cents and a stamp to pay postage.

C. B. WRIGHT, Belmont, Belmont Co., O.

Mr. Wright may be honest—at least I hope he is; but I take the liberty of telling him that the powder he sends has nothing whatever to do with making the sawdust preserve 100 barrels of apples or potatoes. Very likely he has kept apples nicely by the dry-sawdust plan. The method is not by any means new.\* Sometimes the fruit keeps all right, and sometimes it does not; but the plan has not been sufficiently successful for anybody to continue using it. This man may be honest, as I have said; but, notwithstanding, his plan of taking 50 cts. from our people at large, especially from our impoverished farming people, is a lumbag and swindle, and I appeal to our experiment stations to back me up in what I say. I do not know how many other papers are accepting this advertisement. I know that there are some others besides the *Farmer*; but the periodical that helps to swindle the farmers just now will lose a hundred times more than the small amount it gets for the space occupied by the advertisement. Whatsoever a man saveth, that shall he also reap. Instead of a dozen lines of printed matter on a small card, 50 cts. should pay for a considerable book, with appropriate illustrations, in regard to keeping winter apples, or any other rural industry.

## KIND WORDS FROM OUR CUSTOMERS.

GLEANINGS, April 1, I consider well worth a year's subscription.  
ALONZO KNIGHT,  
Plain City, Utah.

Mr. Root:—In regard to your footnote article on "New Celery Culture," pages 300 and 301, we will say the author's full address is Mr. W. H. Jenkins, Sidney Centre, N. Y.,  
Springfield, O. EDITOR FARM AND FIRESIDE.

I like GLEANINGS very much. I especially enjoy reading Mr. A. I. Root's Notes of Travel and Home Talks, especially through Arizona, as I lived there for five years.  
MARIA FRASER,  
Terminous, Cal.

I received the barrel of potatoes yesterday. They were larger and nicer than I expected to get. The freight charges were 90 cts. Thank you for being so prompt in sending them.  
GILDEN, IOWA. MRS. M. E. MOFFATT.

Thanks for the very valuable assistance of advertisement in GLEANINGS. It appears the GLEANINGS people are a very pleasant and progressive family; and the surprising thing is, there does not appear to be any other kind of people in it.  
Terre Haute, Ind. L. H. MAHAN.

The sections you so kindly forwarded have come to hand, and are very satisfactory indeed. I am surprised to get such good sections for "creams." They are even better than the No. 1 sections made at a local mill or factory, and the dovelits put together fifty per cent better.  
W. J. MANLEY,  
Sanilac, Mich.

The goods ordered Mar. 11 reached me April 1, all right; and to say I am pleased with the manner in which the goods were put up is putting it very mildly. I also find that I can get goods cheaper from the Department Store, after paying freight, than I can at home. Please accept thanks for the careful attention you gave my order.  
A. E. ROOP,  
Estey, Mich.

The car of goods has arrived, and I have been unpacking them. I am very much pleased with the improvements in the hives. Surely the Danzy cover

\*Other substances, such as bran, oats, cut straw, etc., in place of sand for potatoes, have been used successfully in lieu of the sawdust. Protecting the fruit from the air by wrapping it in tissue paper, exactly as oranges and lemons are shipped, amounts to the same thing. It usually helps to preserve the fruit, but it is not a sure thing, by any means.

is by all means the nicest I have ever seen. But what surprised me most was the new Weed foundation. I thought sure at first I was 500 lbs. short on foundation, but on opening a large box I found it filled with nice paste-board boxes. I said, "What in the world is this?" I opened one, and was I pleased? Well, I can not find words to express my pleasure. Surely, The A. I. Root Co. leads in improvements in bee supplies. I now feel sure that whoever gets an order filled with this foundation will be a customer for all time. I have never seen any thing to compare with the packing or the fine appearance of this foundation.  
J. B. MASON.

Mechanic Falls, Me., Apr. 12.

As long as there is "Our Homes" department in GLEANINGS (I haven't owned a colony of bees in three years!) I do not know how I can get along without GLEANINGS. It is the only thing that comes to me now which came to my once happy home away back in Ohio. I then had a kind and loving wife, and nearly a hundred colonies of bees. But continued poor seasons and foul brood I succeeded in eradicating the latter, however, drove me to other business, and in May, 1893, pneumonia robbed my home of its only charm—my precious darling wife; and, friend Root, GLEANINGS was one thing that helped to make my home a happy one, for it helped me to be a better man than I ever would have been had it not been for GLEANINGS; and my wife, too, used to enjoy the Home Papers so much.

I hope you, Bro. A. I., will be spared many years. I am afraid I should lose my interest in GLEANINGS if the time ever comes when there are no more "Home Papers," and I may lose my interest in the bees too; but I hope I shall never lose my interest in the risen Lord, in whom you have helped me to strengthen my faith.  
BASIL T. BLEASDALE,  
Shell Rock, Iowa.

A KIND WORD FROM "MERRIE ENGLAND."

My Dear Mr. Root:—I suppose I may call you a brother, not only as a bee-keeper, but as a follower of the Lord Jesus Christ. I must express my sincere thanks to you for GLEANINGS, with many valuable points, not only bee-wise but otherwise. I lend GLEANINGS to my friends here who are not bee-men, and they are charmed with it, and look out for it as anxiously as I do. I may say, also, I have your A B C, 1891 edition, and consider it one of the most valuable and helpful books I have among my bee-books, and I have over forty volumes devoted to bees and subjects pertaining to bees.

I note in GLEANINGS several articles on foundation with deep cells. Would you kindly mail me at once several samples of some? I am making up a bee-cultural exhibit for our Notts County Show, in June (early), and I should be grateful if you could send me at once a few samples of deep-cell foundation. I used the Weed foundation once last year, and had splendid results. In this district (Nottingham) we have had a trying spring for bees, and in my own apiary spring dwindling has been greater than I have ever known. If the fine warm days do not come soon I shall not have my colonies strong enough to take full advantage of the honey-flow.

Let me also say I join hands with you in your crusade against smoking. I am (please without egotism) a local preacher, Sunday school teacher, Band of Hope worker, and am anxious for any thing to lift up my fellow men and women around me; and I must sincerely thank you again for the inspiration and help I have derived from your Home Talks, etc. I may not meet you on this side; but, dear brother, I will meet you at "the fountain" by and by, in God's good time. With every good wish I remain, dear sir and brother, faithfully yours.

Stapleford, Eng. PETER SCATTERGOOD, JR.

[Many thanks for your exceedingly pleasant words, my good friend S. By the way, it occurs to me that you are rightly named. I have been wondering whether it is because of your name that you have taken up all of this good work. If it were the fashion nowadays to give a man a name according to his habits, we might understand why they should call you Scattergood. I assure you Mrs. Root will value your kind letter, for England is her old home. We have been talking some of visiting the scenes of her childhood; and if we do we shall try to give you a call, dear brother. May God bless and sustain you in your good fight.—A. I. R.]

## Root's Goods.

Before placing your order for this season, be sure to send for Root's

**1897 Catalog, ready now.**

Our 1897 hives, with improved Danzy cover and improved Hoffman frames, are simply "out of sight." Acknowledged by all who have seen them to be a great improvement over any hive on the market, of last year.

## Comb Foundation.

Cheaper and better than ever; clear as crystal, for you can read your name through it. Process and machinery patented Dec. 8, 1896, and other patents pending. Samples of the new foundation free.

## The A. I. Root Co.,

Main Office and Factory, **Medina, Ohio.**

Branch offices at 118 Michigan St., Chicago; Syracuse, N. Y.; St. Paul, Minn.; Mechanic Falls, Me.; No. 10 Vine St., Philadelphia, Pa.

## Untested Italian Queens.

Queens ready to mail, either golden or dark queens from select stock, at 65 cents each;  $\frac{1}{2}$  dozen, \$3.50; dozen, \$6.50; two or more dozen at \$6.00 per dozen. Tested queens, 75 cents each.

W. A. COMPTON, Lynnville, Tenn.

Orders filled by return mail or freight for A. I. Root Co's supplies, our choice strain Italian queens; one, two, and three frame nuclei. If you want good goods at low prices and in a hurry, send us your orders. 36 page catalog free.

JOHN NEBEL & SON, High Hill, Mo.

**BEES QUEENS**  
Smokers, Sections,  
Comb Foundation,  
and all Apianian Supplies  
cheap. Send for  
FREE catalogue. E. T. FLAGGAN, Belleville, Ill.

**QUEENS,** Either 3 or 5 banded, 75c each; 6, \$1.25 Nuclei, and all kinds of supplies cheap. Eggs for hatching B. P. Rocks, 75c; S. C. B. Leghorns, 50c per B. Catalog free.

CHAS. H. THIES, Steepleville, Ill.

**Italian Queens,** either golden beauties or 3-banded imported stock. Tested, \$1.00 each; untested, 70c each; half dozen, \$4.00. One queen to new customer, 65c. P. O. M. O. Rice, Lavaca, Ark.  
E. A. SEELEY, Bloomer, Ark.

## Pure Italian Queens.

Fifty cents each. Warranted first-class. No black bees here, and no disease. Safe arrival guaranteed.

W. C. GATHRIGHT, Dona Ana, New Mex.

FOR SALE AT A BARGAIN. **40 SWARMS OF FINE BEES,** in healthiest locality in the South. Address **F. J. ROHNER,** Forest Home Apiary, Grand Bay, Ala.

FOR SALE.—75 Colonies of Italian Bees, in eight-frame Langstroth hives. Price \$4 to \$4.50 per colony. Discount on five or more colonies. L. Vandereike, Lake Mills, Jefferson Co., Wis.

## Second-hand Bicycles

offered recently have all been sold, but we have two more. One **Remington Racer** (made by the Remington Arms Co.), weight 20 lbs.,  $1\frac{1}{2}$ -in. tubing; nearly as good as new, and listing \$110.00. We offer for \$45. Reason for selling, A. I. R. expects to ride 1897 model.

One second-hand **Victor**, '95 pattern; wood rims; wood handle-bars; Morgan & Wright tires. Sold originally for \$100.00. We offer for \$25.00. It is in good riding condition, having been overhauled in our bicycle-repair shop.

Wax at market price will be accepted in place of cash.

**THE A. I. ROOT CO., Medina, O.**

FOR SALE.—200 Cases, two 60-lb. cans to case, at 35 cts. a case. I have a large quantity of them; they are new cans, clean and nice inside, but my using steam in storage warehouse caused them to be a little rusty outside. Order 10 cans as sample; speak quick.

W. I. SELSER,  
10 Vine St., Philadelphia, Pa.

The A. I. Root Co's Philadelphia office.

## Wants and Exchange Department.

WANTED.—To exchange Italian queens, bred from imported mothers, for plants, seeds, pet stock, or Cowan extractors. What have you to offer?  
J. H. GARRISON, Cor. Louisville and Cheltenham Aves., St. Louis, Mo.

WANTED.—To exchange single-case World type-writer (good as new); also hybrid bees in full colony, for extracted honey or offers.

A. W. GARDNER, Centreville, Mich.

WANTED.—To exchange Pekin ducks or eggs for Italian bees, African geese, or offers.  
JOHN BURR, Braceville, Ill.

WANTED.—To exchange a Given press, as good as new, for offers, or any thing useful on a farm.  
J. W. H., Bronson, Mich.

WANTED.—To exchange empty L combs, free from disease, in Hoffman frames wired, drawn from full sheets foundation for sections, shot-gun, foundation, talking machine, team harness or offers.  
C. S. YOUNKIN, Confluence, Pa.

WANTED.—To exchange a 2-horse-power gasoline engine. Wanted—lathe and mechanical tools.  
ROBERT B. GEDYE, La Salle, Ill.

WANTED.—To exchange for any thing useful, St. Bernard puppies at greatly reduced prices; also pure-bred Poland China hogs and Pekin ducks.  
W. W. PREVEY, Elroy, Wis.

WANTED.—25 second-hand bee-hives. Describe, stating price. E. T. BROCK, Danby, N. Y.

WANTED.—To exchange Belgian hares, homing pigeons, White Leghorn eggs or breeding-stock, for Italian queens from imported mother, pure-bred geese, ducks, or ducks' eggs, or offers.  
EUGENE MANNING, Jacksonville, N. Y.

## Honey Column.

## CITY MARKETS.

CHICAGO.—Honey.—Fancy white, 13; No. 1, white, 11; fancy amber, 9@10; No. 1 amber, 7; fancy dark, 8@9; No. 1 dark, 7; white extracted, 5@7; amber, 5@6; dark, 4@4½; beeswax, 27. Choice comb honey would sell freely at top quotation, as market is bare.

R. A. BURNETT & CO.,

May 19. 163 So. Water St., Chicago, Ill.

MILWAUKEE.—Honey.—Fancy white, 12@14; No. 1 white, 11@12; fancy amber, 10@11; No. 1 amber, 9@10; white extracted, 6@7; amber, 5@5½; dark, 4@5; beeswax, 26@27. The trade in honey since our last has been dragging, and demand fallen off somewhat. Our supply of choice quality is not large, and think will all be wanted before new crop. The common grades of comb will be the last to dispose of. Hence the moral, improve the quality to a perfect degree, and better sales will follow and better values will accrue.

A. V. BISHOP & CO.,

May 19. Milwaukee, Wis.

ST. LOUIS.—Honey.—Fancy white, 12@13; No. 1 white, 11@12; fancy amber, 10@10½; white extracted, in bbls, 4½; in cans, 5; amber, in bbls, 4; in cans, 4½; dark, 3½@4. In bbls.; beeswax, 24½@25. The demand for honey is and will be light from now to the first of October. Bakers and candy-factories not using any this season of the year, and they consume most of our extra stock.

WESTCOTT COMMISSION CO.,

May 20. 213 Market St., St. Louis, Mo.

DENVER.—Honey.—Fancy white, 11; No. 1 white, 10; fancy amber, 9; white extracted, 6; amber, 5; beeswax, 25. We are having an unusual demand for our brand of extracted honey. It has been well advertised in late, and our customers know a good article when they use it. There are several brands of honey shipped to our market that are not pure, but we believe all Colorado honey on our market to be pure. The great trouble we have to contend with in this dry climate is granulation. We are looking for a good crop of honey this season.

R. K. & J. C. FRISBEE,

May 22. Lock Box 1014, Denver, Col.

NEW YORK.—Honey.—Our market is in good shape—the old crop well cleaned up, both comb and extracted. New crop extracted is arriving from the South, and in fairly good demand at 50@52 per gallon for average common, and 55@60 per gallon for better grades. Beeswax rather quiet at 26@27.

HILDRETH BROS. & SEGELKEN,

May 20. 120-122 W. Broadway, New York

MINNEAPOLIS.—Honey.—Fancy white, 12@14; No. 1 white, 11@13; fancy amber, 10@12; No. 1 amber, 9@10; fancy dark, 8@9; No. 1 dark, 7@8; white extracted, 6@7; amber, 5@6; dark, 4½@5½; beeswax, 25@27. Comb honey nominal. Movement very light and will probably continue so during warm weather. Extracted steady demand, moving on new water white at full quotations.

S. H. HALL & CO.,

May 20. Minneapolis, Minn.

PHILADELPHIA.—Honey.—White extracted, 5@5½; amber, 4@4½; dark, 3½@4; beeswax, 25. No comb honey in this market but odds and ends. Nobody wants comb honey now. Considerable call for extracted. Beeswax in constant demand.

W. M. A. SELSER,

May 21. 10 Vine St., Philadelphia, Pa.

KANSAS CITY.—Honey.—Fancy white, 12@13; No. 1 white, 11@12; fancy amber, 10@11; No. 1 amber, 8@10; fancy dark, 8@9; No. 1 dark, 8; white extracted, 5@5½; amber, 4½@5; dark, 3½@4; beeswax, 25.

C. C. CLEMONS & CO.,

May 20. 42½ Walnut, Kansas City, Mo.

BOSTON.—Honey.—Fancy white, 13; No. 1, 11@12; white extracted 7@8; amber, 7@6; beeswax, 25@26. Our market is without change as to price, but we note a lighter demand natural to the warm weather.

E. B. BLAKE & CO.,

May 19. 67 Chatham St., Boston, Mass.

DETROIT.—Honey.—Fancy white, 10@12; No. 1 white, 10@11; fancy amber, 8@9; No. 1 amber, 7@8; white extracted, 5@6; amber, 4@5; beeswax, 25@26. Dark comb not much called for, and what there is in sight is not attractive, and buyers of it can make the prices.

M. H. HUNT,

May 20. Bell Branch, Mich.

SAN FRANCISCO.—Honey.—Fancy white, 10; No. 1 white, 9; fancy amber, 7. No. 1 amber, 6; fancy dark, 5; No. 1 dark, 4; white extracted, 5; amber, 4; dark, 2; beeswax, 24. New honey of very fine quality is coming in the market. The crop will be a good one, but less than expected three weeks ago. Looked for late rains did not come.

HENRY SCHACHT,

San Francisco, Cal.

CINCINNATI.—Honey.—No. 1 white, 10@13; No. 1 dark, 8@10; white extracted, 5@6; amber, 4@5; dark, 3½@4; beeswax, 22@25. CHAS. F. MUTH & SON,

May 18. Cincinnati, O.

COLUMBUS.—Honey.—Fancy white, 12@12½; No. 1 white, 11; fancy amber, 8. Strawberries are now arriving so freely that honey is slow sale. Advise no shipments without direct communication with us.

THE COLUMBUS COM. & STORAGE CO.,

May 22. 409-413 N. High St., Columbus, O.

CLEVELAND.—Honey.—Fancy white, 12@12½; No. 1 white, 10@11; fancy amber, 8; fancy dark, 7.

A. B. WILLIAMS & CO.,

May 25. 80-82 Broadway, Cleveland, O.

FOR SALE.—Fancy extracted in 60 lb. cans, and fancy comb (Danzy sections) mangrove honey in 30-lb. cases. Cash offers wanted, f. o. b. here.

H. PRICE WILLIAMS, Miami, Florida.

Barred & White Pl. Rocks, Lt. Brahmas, Langshans, Bf. Cochins, White Wyandots, Brown & Buff Leghorns, Pekin Ducks. Our stock will surely please you; order now.

## POULTRY SUPPLIES.

We are America's Headquarters. Biggest Stock, Lowest Prices, Quick Shipments.

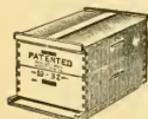

NISSLY'S POULTRY ANNUAL and catalogue of "EVERYTHING FOR THE POULTRY YARD" is a book of 80 6x9 pages, finely illustrated and full of information. The book is FREE TO ALL, but we request a 2c stamp for postage.

GEO. J. NISSLY, Saline, Mich.

# 1000 First-class Sections for only \$1.50.

I have on hand about 40,000 strictly first-class 4¼x4¼ one-piece sections. For such sections the leading dealers are asking from \$2.25 to \$5.00 for a single 1000, but I am anxious to turn these sections into money as soon as possible, and also anxious to increase my subscription list; therefore, as long as any remain unsold, I shall offer 1000 sections and the Review, to new subscribers, for only \$2.50. I will also furnish a tested Italian queen and the Review one year, to new subscribers, for only \$1.50; or a Bingham Conqueror smoker and the Review for only \$1.75.

W. Z. HUTCHINSON, Flint, Mich.

## DANZENBAKER HIVE AND HONEY

won Highest Honors at the Fairs, and pays Premiums to purchasers

Bingham Smokers have all the new improvements. Before buying a Smoker or Knife, look up its record and pedigree.

FIFTEEN YEARS FOR A DOLLAR; ONE HALF CENT FOR A MONTH.

Dear Sir:—Have used the Conqueror 15 years. I was always pleased with its workings, but thinking I would need a new one this summer, I write for a circular. I do not think the 4-inch Smoke Engine too large. January 27, 1897. Truly, W. H. EAGERTY, Cuba, Kansas.

T. F. BINGHAM, Farwell, Michigan.

## A Penny Saved is a Penny Earned.

Yes, it's better than that, for the saved penny you don't have to earn twice. Well, the Weekly American Bee Journal will help you save your pennies. It is a real money-saver to the bee-keeper who will read and practice its teaching. The regular price is \$1.00 a year, or only about two cents per copy. But in order that new readers may give it a trial we will send it for only 50 cents from the time we receive your subscription to the end of 1897. Now, the sooner you send the half dollar, the more copies you will receive. Send to stamps if more convenient. Sample copy free.

## STRAY STRAWS

FROM DR. C. C. MILLER.

THE *Pacific Bee Journal* reports good prospects in California. Glad of it. Some nice people there.

BOKHARA CLOVER probably is not so called because the seed is hulled, but because it comes from Bokhara, in Asia.

BOTTOM BOARDS painted with heated coal-tar 27 years ago are good yet, says C. P. Dadant, in *American Bee Journal*.

REPLYING, Mr. Editor, to your remark, page 361, the extra-thin foundation that didn't suit me was several years ago, so of course it was old process.

EDITOR YORK thinks there is a possibility that, in the near future, bee-keepers might do well to co-operate with the American Fruit-growers' Union in effecting sales of honey.

TOOK FIRST HONEY of the season May 8. Didn't extract—just *shook* three combs, getting two pounds of thin dandelion honey—light, with a very pronounced flavor; liked by some, disliked by others.

R. C. AIKIN is heterodox when he says of hive-escapes, "They will not do the work rapidly enough;" but some others of us can't wait for them at out-apiaries, and don't like to offer a premium to thieves by leaving them on over night."

TREES barked by rabbits can be saved, says Fred Grundy, in *Epitomist*, by splitting open a drain-tile, wiring the two parts together around the tree, then filling up the space with earth. Why not *prevent* the gnawing in the same way?

LE PROGRES APICOLE says the British Bee-keeper's Guide Book has reached its thirty thousandth copy, and that no other apicultural work has reached so large a circulation.

*Mais, mon cher Progres*, Root's A B C has about doubled that.

THE MORE STORES a colony has in winter, the less it consumes; for honey is a splendid thermic regulator, making the bees suffer less from sudden changes of temperature, so consuming less.—*Dr. L. Latimne, in Progres Apicole.* [There may be something in this.—Ed.]

C. C. PARSONS, in *American Bee Journal*, says that, after a trial of seven years, he has never had a swarm desert its hive, no matter what the shade or ventilation, if he put into the middle of the hive an empty comb, filling out with frames of foundation or starters.

WHAT YOU SAY, p. 371, Mr. Editor, reminds me. Years ago a citizen of Marengo called my attention to some shade-trees four feet high in his yard that he had just got from the nursery. They were lindens, and he had cut down some big basswoods to make room for them. Actual fact!

WATERING BEES. Take a common stone crock; cut a board  $\frac{3}{8}$  inch smaller than the diameter of the crock, then bore several  $\frac{3}{8}$  holes in it, and fill each hole with a wick. Put more boards under it when water-soaked, so as to keep it a little above water level.—Michael Haas, in *American Bee Journal*.

HIT 'EM AGAIN, friend A. I. (p. 387). The idea that a number of sensible people can not meet socially of an evening without eating something unseasonably is an absurdity worthy of the dark ages. But, say! You just report to us when you have a gathering of that kind at your house without feeding them. Dassent!

I'M NOT DIETING NOW—I'm eating. I never had so much fun in my life eating apples. Three for breakfast, three for dinner. When I don't eat three I eat four or five. Before the beef diet, half an apple was too much for me. [Yes, indeed; the beef diet, after one has been on it for a year, puts him in much better condition to eat articles of food that formerly were almost poisonous.—Ed.]

THE NEW UNION, since it has turned out there are to be two, needs another name so the old and new Union will not get mixed. "Alliance" has been suggested, also "League." The latter has the advantage of brevity. [I do not like either name. What is the matter with "Association"—the name we formerly had? "The United States Bee-keepers' Association"—that sounds well.—Ed.]

R. A. TOBEY, p. 375, gives a fair showing of the variation in the weight of sections. While the average of all was 14½ oz., that of the heaviest case was 16.6 oz., and that of the lightest 13.2 oz. Of course, single sections in the heaviest were more than 16.6, and in the lightest less than 13.2. Is it just the thing to sell such sections by the piece, charging as much for the lightest as the heaviest?

WM. McEVOY, Canada's Foul-brood Inspector, says the Wisconsin foul-brood law is the most perfect one in the world, and one that every State and province should copy after.—*American Bee Journal*. [McEvoy's opinion of the Wisconsin law is worth much, for certainly he ought to know. Perhaps it would be well for bee-journals to hold up this law as the ideal law for: other States to enact.—Ed.]

R. WILKIN thinks we ought to have a word to express the contents of a hive exclusive of the box containing the bees. Seems to me there are several new words needed. Who'll furnish them? [Supply-dealers, in referring to that which goes to make the inside of the hive, without the bees, speak of it as "inside furniture," as "fixtures," as "frames and sections." To my notion, the first name is the best.—Ed.]

SUPERS ought to have been put on my hives the first week in May, according to the orthodox rule, that they should be put on as soon as white wax is seen along the top-bars. Possibly some of them might store dandelion honey in sections, but I'd rather have the honey worked up into bees for the clover crop. [The season is considerably later this year, and we shall have to make our calculations accordingly.—Ed.]

PROF. A. J. COOK, in *American Bee Journal*, says, "We used to hear a good deal about dividing bees, or artificial swarming; but in these latter days I think very few attempt any increase except by natural swarming." Tut, tut, professor! don't think that, because we don't talk as much about it as when it was new, we don't practice it—lots of us. Last year I increased 121, only two of which were natural swarms, and one of them ran away before it was hived.

THAT GOOD-LOOKING AUSTRALIAN presents a strong argument in favor of queen-cells in drone-comb, p. 365. [Photography always tells the truth, and a half-tone reproduction is the same thing in printers' ink. If friend Jones

had told us what he could do, may be we might have disbelieved him; but when he gave us a peep of the thing itself, so that we could actually see it, then there was no room for doubt. I hope many of our readers will try the method there described.—Ed.]

SO MAGIC CEREAL is ahead of postum cereal, is it? First I've heard of it. Can't you send me a sample, Ernest? [Just ask your grocer for it and he will have to get it. It is made, I think, by the Akrou Cereal Co., Akron, O.; and while you are about it, ask him to give you a sample of "Gran-o." This is another substitute for coffee, and it is said to go twice as far as any other for the money. We are just trying it at our house, and have not come to any definite conclusion.—Ed.]

BEEs STINGING each other are generally supposed not to lose the sting. R. Wilkin rescued a queen from hostile bees, but one of them had stung her below the eye; and when pulled apart the sting and poison-sac remained firm with the queen, killing her. [It seems to me that, when I was working with the bees in queen-rearing, whenever a queen was stung in a ball she was more apt to hold in her body the sting she received than not. I remember very distinctly of drawing the stings from several queens, hoping thereby it would not be too late; but they were all fatal.—Ed.]

PROF. BRUNER, so favorably known by those who attended the Lincoln convention, has been employed by the Argentine Republic to study the grasshopper plague they've had for ten years. He sailed April 24 from New York, having a year's leave of absence from the University of Nebraska. Success to him. [The selection of Prof. Bruner from the number of very able men in this country, by the Argentine Republic, is indeed a compliment. The bee-keepers who attended the Lincoln convention will not soon forget his very interesting lecture on the "Wild Bees of Nebraska," and the kindly way in which the many questions which were piled to him, right and left, were answered. If I mistake not, his selection was due to the fact that he is a real student of nature. He does not go to other authorities so much as he goes to Nature herself, and from her gleans the actual facts. From a boy up he has been a bug-hunter.—Ed.]

"IT WOULD HAVE a tendency to keep others from making the same mistakes if we would be a little more frank in reporting ours," is a truth G. C. Greiner puts on page 367 that will bear repeating. If a department, "Mistakes and Blunders," is published in GLEANINGS, I'll promise not to skip it in my reading. ["Mistakes and Blunders" as a department in GLEANINGS—a capital idea! and for fear that I may forget to carry it out, I will ask you right now, doctor, to give us the first batch. They

may be short, like Straws, if you want them so, or they may be longer, just as you see fit to touch them up. After you have given us the first batch, then I should be glad to have Mr. Greiner give us the second; later on, perhaps Mr. Doolittle, Mr. Crane, Mr. Manum, and others, can keep the department alive. I am rather of the opinion that some of our best and most successful bee-keepers can give us some interesting and valuable facts from their experience. Such a department may show the truth of what Josh Billings once said: "Eggsperience keeps a good skule, but the tewishun comes purty hl."—ED.]

ON PAGE 343 it reads as if prosperity never brings a man nearer Christ. You don't mean that, do you? friend A. I. When I'm full of real gratitude for prosperity, I'm sure that is being brought nearer. [Dear old friend, it seems a sad reflection on humanity, but I am afraid it is true that prosperity seldom if ever moves one nearer to Christ Jesus. When I had that pleasant visit at your home some years ago, your pastor said to us something like this: "I presume each person who sits before me would like to take the risk of sudden prosperity; and each and all of you think *you* would be an exception to the general rule. But the sad fact remains, demonstrated over and over again, that there is more to be feared from riches than from poverty." Since I heard that, I have been watching for instances to the contrary; but if I have found them, they are few and far between.—A. I. R.]

UNCLE AMOS, why can't you be fair? You come down on me because I couldn't in four months do what Maria Fraser did in four years—make good jumbles without sugar or molasses. After four years she thinks she has found a recipe that can be relied on, but I don't think I could find it in twice four years on page 375. At any rate, I give it up. Now tell me where to find it. [My dear old friend, I will take back every word I have ever said against you, and I won't ever try to look down on you again if you will forgive my stupid blunder. We went and published the good lady's remarks about that beautiful honey-cake, and told how we manage it, and then left out the recipe entirely. I wonder what Maria Fraser thought of us, to see her recipe come out in that style. But, fortunately, we have succeeded in hunting up the letter, and fishing the recipe out of the waste-basket, and here it is: "Two cups honey; one cup butter; four eggs (mix well); one cup buttermilk (mix); one good quart flour; one level teaspoonful soda or saleratus. If it is too thin, stir in a little more flour. If too thin it will fall. It does not want to be as thin as sugar cake. I use very thick honey. Be sure to use the same cup for measure. Be sure to mix the honey, eggs, and butter well together."—A. I. R.]

By R. C. Atkin.

#### MARKETING HONEY; A VALUABLE ARTICLE.

This is another subject much written upon and talked about. However much has been said, the subject is by no means exhausted, and comes up at every convention, and will not settle.

Go with me into any grocery and look at the goods there handled. Every thing in the way of liquids, except perhaps vinegar, sorghum, and honey, are so put up that they can be handled by the piece. All solids are either in package form, or in such shape that they can very quickly be weighed or counted out. Vinegar, coal oil, and such, are measured out, it is true; but there is of necessity a vessel in each household for these things, and the vessel is taken to be filled again, when empty. Just think it over for yourself and answer the question: Is there a single article in the grocer's line so awkwardly handled as extracted honey? I have no particular criticism to make in regard to retailing comb honey, but I must say that extracted is very poorly marketed.

We put our extracted honey in 60-lb. cans, barrels, etc., and ship to the wholesale or commission dealer. These in turn sell it out to the retail men in small lots; and when they come to get out the honey they find it candied. Even if it did not candy, it is a hard article to retail in this way, because it must be kept warm or else the dealer must spend much time waiting on it to run out. I have retailed a number of tons of extracted honey, and I know what kind of a job it is. If you were a storekeeper, and had your choice of selling maple and other syrups in regular packages, or honey drawn out into the customer's vessel, would you not choose the regular package? I am sure you would, and that is just what is done.

But how are we to get it into regular packages? There is the rub. We have no suitable regular package—in fact, no regular retail package. The Root establishment is supposed to carry about every thing of value going, and I will just look over their list. First, I find glass vessels. There are the Pouder and Muth jars. One-pound size costs about 4 cents each by the 100. Other glass packages of 1-pound capacity from 2½ cents to nearly 5 cents each. These are the prices *there*, not delivered to the producer. We must pay the freight on these, and then we must be at the expense of casing

or crating them in some safe way to ship. The result is, that by the time the honey is ready to go to the wholesale market it has cost us about 5 or 6 cents per pound for packages alone. If the honey is worth 5 and the packing 5 more, there is 10 cents right at your honey-house; and by the time we add freight, and commissions to both wholesale and retail dealer, say 1 cent freight and 25 per cent for commissions, it costs twice as much as the best sugar.

Of tin packages, first comes the 60-lb. can. These are wholesale packages, and cost us, the can and freight,  $\frac{3}{8}$  of a cent per pound on the honey put in them. Next comes the 12-pound square screw-nozzle cans. These will come at about  $1\frac{1}{4}$  cents per pound—possibly a little more. Then there is the "Jones honey-pails with screw-cap," that the catalog says "are the most convenient pails that we know of, that are suitable for shipping liquid honey in." One-pound size comes at  $4\frac{1}{2}$  cents—all of 5 cents by the time we get it; five-pound pails at almost 2 cents per pound. There are next "tin pails with raised covers," but these do not seal, and will not answer. The last on the list is "Record's tight-seal cover pail." These are not made for honey, but for butter and lard. I don't know whether they will shut tight enough to risk shipping honey in them when they are stood on their heads or in any position other than right side up. The cost of these is a trifle less than the others.

These vessels are not crated or boxed ready to ship full of honey. Even if the cost were low enough, every apiarist is not fixed for crating them. By the time we crate them we have put the cost of packages considerably above the foregoing figures—just about what the honey now brings at wholesale in 60-lb. cans and barrels. We can not put honey in packages that cost as much as the honey alone will bring. Suppose the honey worth 4 cts. and the packing 4, then the freights, etc., on that, and "where are we at?" Do not forget that I am not talking about the local retail trade from our honey-houses, but the general markets.

We must have a regular package. We have a standard for comb honey, sections of certain weight, and so many in a case. A dealer can order so many cases of 12 or 24 pound size; and when he retails it he sells it out by the piece or pound, and no bother; but here we are with extracted honey in all sorts of vessels of wood, tin, or glass, some of the packages costing more than the honey itself can be bought for. The only way a retail dealer can get extracted honey to his customers is to get it put up for him by a local apiarist, or buy it in wholesale packages and then repack it, and run the cost to or above comb, or draw it out into the purchaser's pail. If we are to sell to bakers or manufacturers, then the large can or barrel is all right; but we want to sell for table use too.

and the purpose of this article is to tell why we do not, and how we can get the table trade.

Extracted honey is not nearly so largely used as it should and would be, because it is not put up so that the people can get it as they do the competitive sweets. I know that Mr. C. F. Muth and some others are doing good work; but Muth can not handle all the honey. What we must do is to get our goods in shape so that, when it is once packed, it is there to *stay till the consumer gets it*. Other syrups and sweets are so put up that the packages are regular, go from packer to wholesale house, and through the regular channels of trade, in unbroken cases till the local grocer gets it, when the case is broken and the original can sold to the consumer.

But how are we to get it so? At present I see but one way. We must co-operate. We can establish packing-houses at suitable places to receive the product in its vicinity. This house (or association) can have its trademark or label; buy its cans in car lots; can, case, and market the goods in a regular way. You will say, "Why not each apiarist pack his own honey, get his cans from the general house, or depot, and pack at home?" The reason why this will not work is plain. Suppose the apiarists about Denver would undertake this. Perhaps no two of them would grade just alike. Perhaps one out of 10, 25, or 50, would either ignorantly or willfully pack a lot of off-grade honey. It would, of course, go out with the rest, and eventually damage the reputation of the association or firm which guaranteed it. No; it must be packed by an experienced packer who knows his business. The farmer may just as well pack his own pork, or the fruit man his own apples; but these and other products must go to the regular packer. We may pack for local trade or special customers, but we can not do this for the general trade.

One difficulty that meets us here is that there is not enough honey produced. There, now, won't I catch it? The idea of saying there is not enough produced when we can not sell what we have! Yes, I say it, and it is a fact. If there were ten times as much produced there would be some inducement for capitalists to start packing-houses, depots, or honey headquarters in every city, so that, when we have honey to sell, we should have a place to put it. Let me illustrate this: I am supposed to be writing this in Colorado; but I am really writing it in Iowa. Well, Iowa is a corn, hog, and cattle country. There are here always corn, hogs, and cattle; and since these things are always here, and in abundance, there are always places to market them. Buyers ride the country hunting up the products. In Colorado, where I live, wheat is the main product, and hogs are scarce. Well, Colorado has its wheat-elevators everywhere, so there is always

a place to put wheat; but if you want to market a hog you must hunt a buyer. Now don't you see the point? Our honey is always hunting a market, like the Colorado hog.

Since, then, we do not produce in quantities that will cause the market to come to us, we must take measures to help it to come. We can organize in some way that we may have market-places that take our honey, put it into suitable shape, and find customers. There is all the work of "introducing our goods;" that the small producer can not do; but if it were packed in regular cases and weights, so that the traveling salesman can represent the goods and take orders just as they do for other lines, honey might be sold so as to make a demand that we know nothing about now. Thousands upon thousands who never eat honey would do so if it were to be had as conveniently as maple syrup. I see no reason why honey may not be put up in cheap cans as fruit is now put up. Put up in this way it might go into the homes of the poor people who never see honey. We have been working the fancy trade by the use of glass and other expensive packages at such prices that it must be a luxury, while the poor people and laborers have been left out.

There is yet the question of honey candying, local markets, etc., that will receive attention in our next article.

Loveland, Col.

[This, I am free to say, is one of the best articles we have received this season. It discusses this very important subject of marketing extracted honey, not in the old stereotyped ways, but on lines that are both sensible and feasible, and I hope every reader will take pains to peruse it carefully.]

Before discussing some of the points, I would state that friend Aikin, either because of error in figuring or because he had got hold of an old catalog, has put the price of retail honey-packages too high. The Powder and Muth jars, in lots of 100, cost a little over 3 cts., instead of 4, as Mr. A. has it. Then there are some other reductions that should be made on the other figures. Square cans, in ten-box lots, cost about  $\frac{1}{2}$  cent per lb., for the honey, not including freight, and the same can be shipped from Chicago, St. Louis, or New Orleans. Two-thirds of a cent per lb., including the freight from a locality in Central Colorado, would not be very far from correct. But very few would have to pay such freight.

I grant that the self-sealing honey-packages seem rather expensive; but they are designed for a fancy city trade. Some of the self-sealing devices are patented, and that makes the packages expensive. Perhaps the most popular honey-package is the Mason jar. The 3 lb. size (1 quart) in gross lots, costs about  $1\frac{1}{4}$  cts. per lb., and the consumer rarely objects to the expense of this jar, because it has an intrinsic value in every household. In the case of any other package, with the possible exception of the jelly-tumblers, the package itself is of no particular value after the honey is out of it.

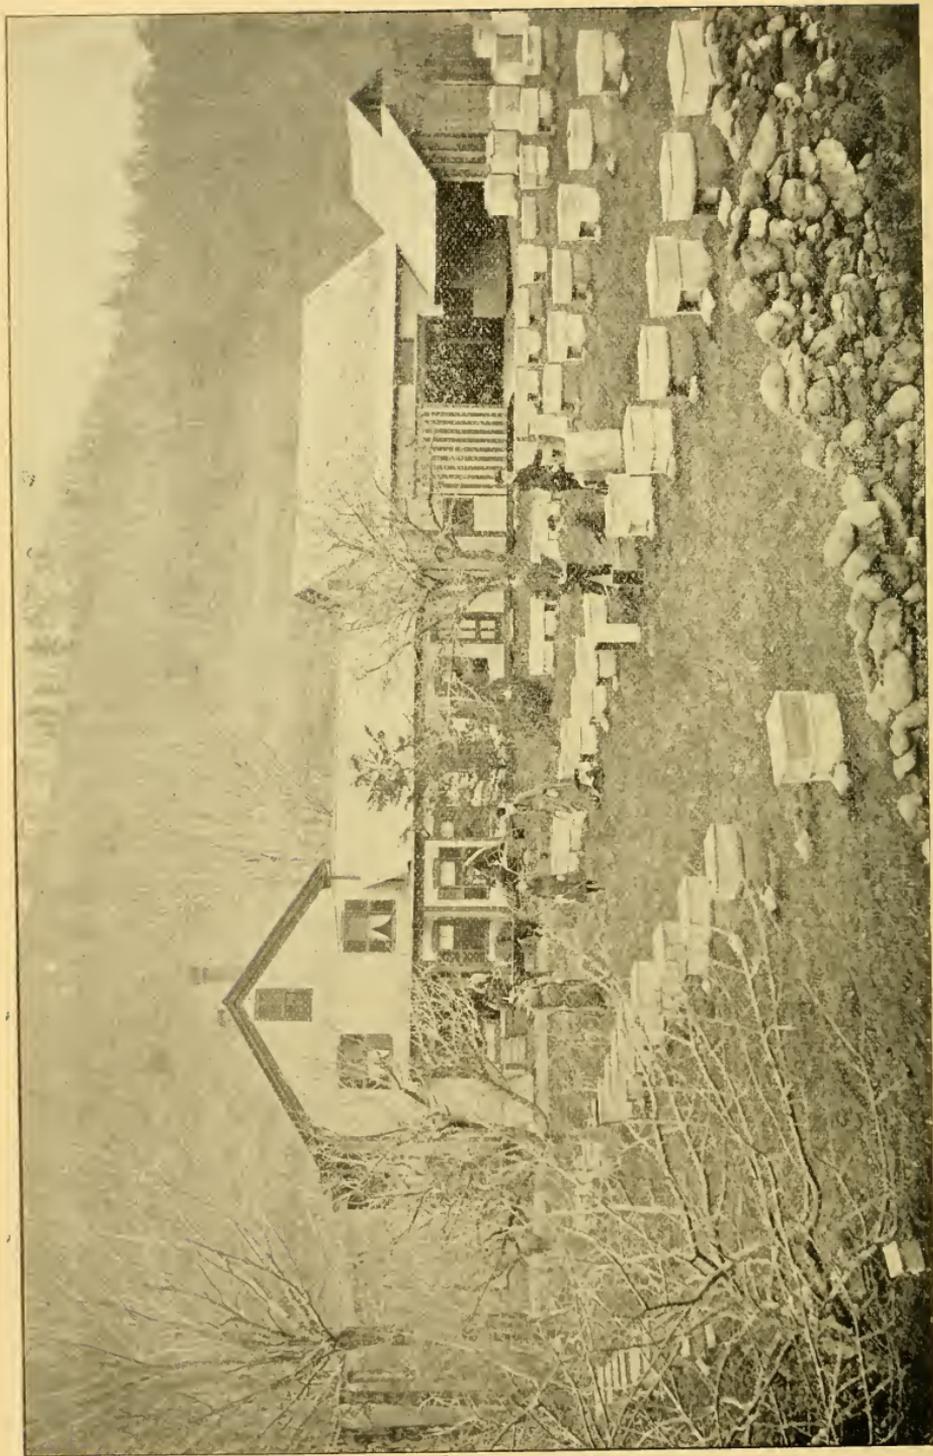

I have said that self-sealing devices make the ordinary screw-top packages expensive. In the case of some, the price is 2 and 3 cts. per lb. Without it, it would be less than half. It has

occurred to me, in view of what Mr. Aikin has said in the last paragraph, that we as bee-keepers ought to make use of some standard tin package, such as is used for canned tomatoes, peaches, etc. Fruit-growers have long since come to the conclusion that a 3-lb. tin can, made of light tin, having the fruit itself soldered in, is the cheapest of any package they could get. This same 3-lb. package would hold about  $4\frac{1}{2}$  lbs. of honey, and would cost the bee-keeper, who bought it in a large way, probably not to exceed a cent a pound for the honey they would hold. But, you say, bee-keepers are not skillful enough to solder these fruit cans when filled with honey. Perhaps; but I know a good many who are. We will suppose, for instance, that Mr. A. has bought 500 cans, each can to hold about  $4\frac{1}{2}$  lbs. of honey when filled. We will say that he has filled them, and is now ready to have them soldered. I venture to say he can get his tinsmith to solder the whole batch in about one day's time; and the cost ought not to exceed \$2.50, or half a cent a can. Honey put up in this shape can be put up in standard packages; and, when neatly labeled, said label going clear around the can, will compare favorably with any other goods on the markets. They can be tipped upside down, any way, and there will be no danger of leaking. I grant that this idea of tin fruit-cans for honey is not new; but I am of the opinion that it has not received the recognition it deserves.

But it would be no very great trick to do the soldering oneself. Soldering-kits are furnished very cheaply now, and the directions that go with them make the whole thing plain. I have known of a number of instances in California where the bee-keepers soldered all their own square cans.

In Mr. Aikin's last paragraph he touches upon a point that is by no means a visionary scheme. The California Bee-keepers' Exchange is organized, if I am not mistaken, for the very purpose of seeking an outlet for the honey from its members; that is to say, it is to take the annual crops of honey from bee-keepers, in the bulk, and put them in uniform packages of various sizes for the general market. Such a scheme ought to be favorably considered by the bee-keepers of the East; and I believe it would be well for the United States Bee-keepers' Union to discuss the matter at its next meeting.

Let us now consider some of the advantages. One large packing-house, or, if you please, several of them, scattered at strategic points, could buy up the honey from bee-keepers in every direction, in the bulk form. If uniform packages were agreed upon, and this honey were put into such packages, with neat labels, and a guarantee of absolute purity, it would do much to help bee-keepers secure better prices. I know of one large under-buyer who mixes his strong-flavored honey with that which is milder flavored, thus making a honey that is both uniform and pleasant. One honey-buyer mixes alfalfa and strong basswood, and calls it "lucerne." The alfalfa alone sometimes has a flavor that is too mild, and the basswood is sometimes too strong. Combining the two makes a flavor that is just right. You see the point is here: A large packing-house could take the honey from several sections of the country, and combine them in such a way as to make one kind of honey of uniform flavor, and thus it would bring a good price. I do not mean to say that buckwheat should be mixed with clover, but that two or three grades of amber might be mixed, or two or three grades of white honey, and both the white and the amber would be much the better. I hope this question will be thoroughly discussed.—Ed.]

THE W. W. CARY APIARIAN ESTABLISHMENT, COLRAIN, MASS.

### W. W. CARY'S APIARY AND BUSINESS.

My father's apiary was established about 1840. Mr. Langstroth was a familiar visitor in my early recollections, and made many experiments with my father when inventing his hive.

My apiary usually contains about 100 full colonies, and in summer is sometimes increased to 300, including nuclei, and has been for 35 years devoted almost exclusively to breeding bees and queens, only a few colonies being run for honey, and these for experimental purposes. My father was the first man to propagate the Italian bee, as you will see by catalog, page 4; also testimonial of Mr. Langstroth, page 45. I have spent considerable money in testing all the different races of bees, and find none but the Italians that seem to fill the bill for all purposes.

I have reared and sold many thousands of queens, and my trade in full and nucleus colonies has amounted to 150 to 200 in a single season.

My mill and storehouses contain over 12,000 ft. of floor space. I have made a specialty of the manufacture of bee-keepers' supplies ever since the invention of the movable-comb system, and have added 2400 sq. ft. of floor space during the past season, including a new room for working wax, 12x50, which is fitted with four foundation-mills and a steam-heater for melting the wax. My father and I bought two of the first mills sent out by A. I. Root, and have used several different machines since. I can not tell you what my annual output of goods is, but will say that it amounts to several thousand dollars annually.

W. W. CARY.

Colrain, Mass.

[Mr. Cary, senior, was one of the old pioneers in American bee culture, and one who did much to help father Langstroth in his apiarian career. Some years ago there appeared in these columns a portrait of him, the biographical sketch having been written by Mr. Langstroth himself.

It was a pleasure to do business with the elder Mr. Cary, as it is now with his son, who like his father has been one of our good customers.—Ed.]

### SOME SPECIAL TOOLS FOR THE APIARY.

SOME GOOD IDEAS.

By George W. Leonard.

I send you models of some tools that I have been using with much satisfaction. When I sold my farm, and apiary of one hundred colonies of bees, I sold all my tools and bee-fixtures. I send you a sample of foundation that was made on a set of foundation-plates that I made. The die-faces are dipped into melted wax, the same as the sheets for other machines are prepared; consequently the septum is formed when the wax is in a liquid state. That leaves the grain of wax in a compact state. When the bees draw the foundation out, it does not

expand and bulge as foundation does that is manufactured on machines where it is pressed into shape while in a cold or plastic state. This leaves the grain of the wax in a crumbled form. The bees do not tear it down when not in use.

In making this foundation I use three plates, one of which is engraved on both sides, and the other two on one side only. The plate engraved on two sides is dipped into melted wax, then taken out and quickly laid squarely on one of the other plates, and the third plate is laid on top. The three plates, with the two intervening films of wax, are then run between rolls, the same as in other machines, except that the rolls are not engraved. I then plunge the die-plates into cold water, trim off the edges, and strip off the two sheets of foundation. The plates do not require any lubricant—nothing but pure soft water. Alkali in hard water cuts the wax and makes it sticky. If one wishes to wire the foundation he should wind the wire around the middle plate before it is dipped. I used that machine fifteen years, and made thousands of foundation sheets on it, and it was good when I sold it.

### CENTRIFUGAL COMB-FILLER FEEDER.

The model will speak for itself (see Fig. 1). The quantity of honey put into the reservoir regulates the quantity that is put into the

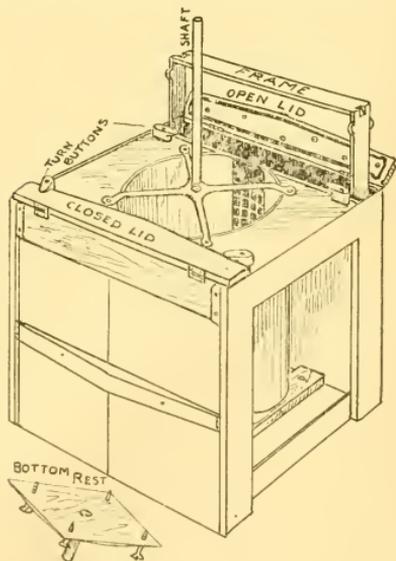

FIG. 1.

combs. To fill the combs full, the reservoir must be two-thirds full. If it is wished to have a large brood-chamber left, fill one-third full. A few turns of the crank of extractor will fill one side. Then open the lids, and with the pliers reverse the combs, and turn as before. Next take out and set over something to drip.

Put sticks between to prevent their touching, or-it will form a siphon and the honey will run out. If the honey is blood-warm the machine can be worked much faster.

FIG. 2.

The pliers (see Fig. 2) are forged out of Bessemer steel. The wide handle is made for scraping propolis and burr-combs. When dull, file square across the edges. The spurs on the inside of the handles are made for lifting sections and drawing separators out of the hives.

#### QUEEN AND DRONE TRAP.

I use mica springs for the escape. These being transparent, the bees make more effort to get through than when metal springs are used. Some twenty-six years ago I used metal springs. When you wish the queen to return into the hive, draw out the mica slide that covers the escape,  $\frac{1}{4}$  inch or more. The only objection to mica springs is, that some swarms will nick off the edges until they ruin the springs.

#### BELLOWS SMOKER.

I did not send a complete smoker, but only the lower part of the barrel (Fig. 4), to represent the double-action mica valve; also a mica valve for the bellows, on a piece of board (see Fig. 5), to represent its attachment to the outside of the bellows, where it can be easily removed when it

FIG. 4.

needs repairing. I find mica the best material for valves. It is light, and prompt in action, and not apt to get out of order. When you blow with the bellows it presses the valve against the draft-tube (see Fig. 4), and that forces the air out of the nozzle. When you stop blowing, the valve springs back and closes the tube connecting the barrel to the bellows, which prevents the smoke and cinders from going into the bellows.

FIG. 5.

I have for a number of years been using an automatic-spacing reversible-frame hive (see Fig. 1). Fig. 6 shows the position of the frames in the package.

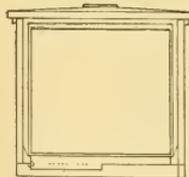

FIG. 6.

The wooden tweezers (Fig. 7) are for picking queens out of the cluster of bees, by the wings. Queens should never be touched with the

FIG. 7.

fingers when it can be avoided. Scent of the fingers causes the bees to ball the queen.

Central Valley, N. Y., Feb. 5.

[Frame-pliers will never become very popular with practical bee keepers. The bare fingers with perhaps a screwdriver is all that is needed to loosen frames and handle them properly.

The smoker-valve arrangement is quite ingenious, and there may be something in it. We purpose trying it in a sample smoker; and if it works I will report regarding it further.

There may be cases where queen-tweezers may be an advantage, but in my hands I should be more afraid of pinching the queen. The ends of the fingers are about as good as any thing that can be used, at least by the average queen-breeder.

The idea of filling empty combs by centrifugal force in the same way that we extract them is feasible; but any thing that the bees can do for us can be done by them far cheaper. I should prefer to let the bees take the syrup from feeders and put it in the combs. It is a rule in plowing to save the man and make the horses do the work as far as possible. The same should be true of the bee-keeper and his bees.—ED.]

#### THE USE OF SWARMERS.

THEIR ADVANTAGES AND DISADVANTAGES; HOW TO CONSTRUCT ONE.

By A. Getaz.

Every once in a while somebody asks me if non-swarmer could be used to any advantage when the apiarist can not be at the apiary every day. If the apiarist can be there twice a week, or at intervals of not more than three or four days, a queen-trap will do as well as a non-swarmer; or even an entrance-guard will do. With the trap there is the advantage of finding the queen there, and also the dead drones, which would obstruct the entrance-guard more or less.

In using an entrance-guard it is necessary that the hive proper should have an entrance the full width of the hive, and at least  $1\frac{1}{2}$  in. high. The guard should be not less than 2 in. off the entrance, full width of the hive, and four or five inches high. All this is in order that the ventilation be not obstructed. All this applies also to swarmer and queen-traps.

If, notwithstanding, the colony is too hot, the best way is to add one or two or even more empty supers on the top, enough to bring the temperature down to the proper point. These supers may have sections, or be without them if necessary.

Under no circumstances whatever have any opening above the entrance in order to have better ventilation. In warm weather, when the outside temperature is nearly as high as the inside, they are almost useless, as they ventilate only on account of the difference. On the other hand, during the night and the cool days they create a draft which, under such circumstances, is a positive damage to the colony, es-

pecially concerning comb-building in the sections. If the apiarist can be there but once a week or less, then a swarmer or non-swarmer or self-hiver, or whatever name you may call the apparatus by, is better than a queen-trap.

After trying all sorts of contrivances imaginable during several years, the only kind I can recommend is something like a queen-trap with the upper part large enough to admit two or three combs. These need not be full size, except for convenience. The lower part of the upper apartment in front of the cones must be of perforated zinc, partly to allow the bees to go in and out, partly because the cones must be where the light strikes them. Neither queen nor drone will go up a cone placed in the dark.

Well, a swarm issues. The old queen goes up into the swarmer. There she will remain with a certain number of bees, and go to work. The bees of the brood-nest, relieved of the quarrelling between queen and queen-cells, or, rather, their attempt to protect the queen-cells against the queen, will also do good work until a young queen emerges. Then the racket starts again; the young queen comes out with a swarm, gets into the swarmer, and kills the old queen. The others follow until there is but one left in the swarmer and one in the brood-nest. This last comes out to mate, and meets the other in the swarmer, and then there is but one left in the swarmer. By that time the apiarist must be on hand, and permit the last queen to mate. Further delay would practically ruin the colony.

When the apiarist comes he will probably find some that have just swarmed, and some that have swarmed or have been repeatedly swarming.

If the old queen is yet in the swarmer, the colony can be divided. If no increase is desired it is necessary to prevent further swarming, to destroy or remove the old queen, and allow requeening. It is not absolutely necessary to destroy all the queen-cells, but yet it is better to do so, except, of course, one or two. At the next visit, only one queen will be there, probably in the swarmer, no brood young enough to raise more queens, and possibly some of the last queen-cells constructed. These can be destroyed, and the young queen allowed to mate.

If a young queen is present, destroy all the remaining cells and let her mate. There is no danger of more swarming if the brood is all capped or too old to raise more queens; and I think there is very little danger, if any, even with young brood, destroyed cells, and a virgin queen; still, I am not positively sure. At any rate, requeening as described above will end the swarming for that year, provided enough room is given in the surplus apartment, even if the brood-nest is not larger than 8 L. frames.

If, instead of allowing the colony to requeen, the apiarist will introduce a young laying queen, it will be necessary to wait until the

bees have been two or three days with no uncapped brood. The nurse-bees have not then taken to the field, and there will not be enough of them to construct more queen-cells after the young queen begins to lay.

Two points need consideration here:

Dr. Miller says the perforated zinc will not prevent the queen from going out with the swarm. Well, my experience disagrees completely with his. I have had but one case where I *think* the queen went through the zinc; but in all the other cases where the queens were missing with the swarm I found some crack somewhere, generally in the most unsuspected places. The queen will remain in a swarmer; but with a queen-trap she will eventually (in the course of two or three days) find her way back through the cone; and if she is then killed by a young queen the apiarist may think that she has escaped through the zinc.

Another drawback is this: It may happen that, when a young queen goes to mate, a swarm comes out from another hive, joins the young queen, and the whole outfit goes to the woods, but not often. I once had a young queen that brought the swarm to her own hive. In fact, the young queen will often return to her hive without paying any attention to the flying queenless swarm; yet a few may be lost that way.

The only way I know of to prevent such loss absolutely is for the apiarist to let the young queens mate only when he is present. After a young queen has tried several days to go out, and failed, she is very keen to do it; and if, after one or two o'clock in the afternoon, the apiarist opens the zinc, she will, in nearly every case, mate at once. Should a swarm issue at that time, the apiarist being there could take care of it.

#### HEATING A BEE-CELLAR ARTIFICIALLY.

OIL-STOVES NOT SATISFACTORY.

By G. C. Greiner.

The closing sentence of Dr. Miller's answer to Mr. Fred B. Cavanagh's inquiry, "Better warm it up some way," is exactly what I should want to do if the temperature of my cellar averaged as low as 35 to 38 degrees; but the question is, "How?"

Years ago I had the same trouble. My cellar was not at that time filled to its full capacity, perhaps not more than one-half or one-third the number of colonies it would accommodate, allowing about 15 cubic feet to the colony. Besides, it had not the outside protection it now has. I mistrusted that, through the colder part of winter, artificial heat would be necessary, and planned to use an oil-stove in the entry.

The latter was a four-foot room, divided by an air-tight partition from the cellar proper. As I had had some experience with oil-stoves before that, I was well aware of the fact that one could not be used in a bee-cellar without being more or less detrimental to the comfort of the bees on account of obnoxious gases and befouling the air. For this reason I took special pains to make the partition air-tight (as I thought), and provided, as an additional safeguard, an extra ventilator, 6 inches square, right over the place which the oil-stove was to occupy.

When the temperature went down to 38 degrees, after it had stood at about 42 the fore part of winter, I lit the stove, which was well trimmed and filled, and the blaze was turned up to where it would give, according to directions, the most perfect combustion, and leave no smell in the room. After six hours (the time that amount of oil is calculated to run the stove) I went to see the effect. On opening the door I found the little room dark, quite warm, and with an offensive oil smell. As the stove went out on account of the oil burning out, I gave the dying blaze the credit of the bad odor, and decided that, thereafter, I would either refill the stove or turn it out before it would have another chance to die a natural death.

The next time I entered the cellar after I had the stove started again, it was still burning at full blaze, but, to my surprise, the disagreeable smell was the same. The bees seemed to be equally displeased. On listening I could hear their roaring through the partition—a decided increase over their natural quiet hum when not disturbed.

Further investigation showed a rise of temperature of 2 degrees in the further end of the cellar, where the thermometer is placed. Now, whether this rise of temperature was caused by the heat of the stove alone, or whether the excitement of the bees had something to do with it, I am not certain; but I am inclined to think it had. The oil scent had also penetrated the partition, and, undoubtedly, disturbed the bees more than the rise of temperature. I agree with Dr. Miller and the A B C, that stoves in the cellar have done more harm than good.

Since making the above observations I have made but very little use of oil-stoves for that purpose; neither have I tried wood-stoves or boiling water; in fact, I do not need either since finding, by experience, better, cheaper, and safer means for keeping my cellar at the desired temperature. First, better outside protection; and, second, filling the cellar to its full capacity, or, if the necessary number of colonies is not available, reducing the size of the cellar. By these means my cellar maintains an average temperature of about 45 degrees, with a variation of not more than one or two degrees either way.

Naples, N. Y.

[While the A B C does not exactly recommend artificial heat for bee-cellars Dr. Miller certainly does if the temperature goes too low; but he uses a small hard-coal stove in the bee-cellar itself, and of course there are no odors because the products of combustion go up the chimney. Oil-stoves, I know, he would not use. A common stove carries away the foul air at the bottom of the cellar, starts the good air circulating, and raises the temperature.—Ed.]

#### PREVENTION OF AFTER-SWARMS.

*Question.*—I wish you would tell us in GLEANINGS how to prevent after-swarms. I know you have written on the subject before, but I can not now turn to it; besides, I wish you to go into the minutæ of the matter so that "a wayfaring man though a fool need not err therein." Last year I thought I could stop such swarms; but I failed, hence appeal to you. Please give the matter your attention in the first issue for June, as my bees commence swarming about that time.

*Answer.*—There are various methods of preventing-swarms, such as removing the old colony to a new stand as soon as the swarm has left it; setting the hive containing the new swarm on the stand it previously occupied; cutting off all of the queen-cells but one on the fifth or sixth day after the first swarm issued; hiving the after-swarms in a box on top of the old hive till the next morning after they came out, when they are to be shaken out of the box in front of the old hive, and allowed to run in, so that the young queens will, all but one, be destroyed, etc. Each of these plans has its various advocates. I have tried them all, besides many others put before the public, and not so given; and, after trying the many, have settled down on the two following as being the cream of the whole. I have used these plans with success for years, and use them in accord with what I wish to do with the old colony.

The first is used only where the old hive is carried to a new stand while the swarm is in the air, on the principle of using the new swarm for the main dependence for comb honey, hiving the new swarm on the old stand. To accomplish what I desire, I proceed as follows:

As soon as the swarm is seen issuing from any hive I go to the shop where I get a box or hive used for carrying combs, which has previously been prepared, having the desired number of frames in it, either filled with combs or comb foundation, taking it to the hive from which the swarm came, when the frames are set out of the box near the hive. I now take off the super and take out the frames of brood, putting them into the box. If the combs of brood

seem to be well covered with bees, and the weather is warm, I shake a part of them off in front of the hive before putting the combs into the box. If few bees or cool weather, I put all into the box, setting the box in the shade, and a rod or so from the hive, as soon as all of the frames of brood and bees on them are in the box.

I now put the frames brought from the shop into the hive and rearrange it, by which time the swarm will return, if the queen has a clipped wing. If the queen is not clipped, then the swarm is to be hived in this prepared hive on the old stand, the same as any swarm is hived. I next put the combs of brood and bees which are in the box into a hive where I wish the colony to stand, and adjust the entrance to suit their wants, when they are left till the next morning. By this time nearly all of the old or field bees have gone back to their old location, so that the young bees which remain are ready to accept any thing in the shape of a queen.

I now go to my queen-nursery, where I generally have on hand virgin queens just hatched (or if I do not have these I get a ripe queen-cell), and select such a queen as I wish them to have, place her in a wire-cloth cage, and take her to this hive. Upon opening the hive I take out one of the central combs, holding the same up before me. As the bees are all young they will at once take to filling themselves with honey; and while they are so doing I let the queen run on the comb where there are a few cells of honey not occupied with other bees filling out of them, when the queen will commence to fill herself the same as she sees the others doing.

The frame is now lowered down into the hive, and the hive closed. In this way the bees and queen appear natural, and I have yet to lose the first queen put in under such circumstances.

As the bees now find they have a queen, they proceed at once to destroy all of their own queen-cells, so that no after-swarm ever issues—at least an experience covering 15 years says that none do.

The other plan which I use is fully as successful as the above, but is used where I wish to treat swarms the way they are generally treated by hiving them on a new stand, in which case I proceed as follows:

As soon as the swarm is hived I go to the old hive from which it came, and mark on it with a pencil, "Sw'd, 6-10," which tells me at a glance that a swarm came from that hive June 10, should that be the date on which the swarm issued, and the one which was marked on the hive. If it should be another day the date is different; but the plan is the same, and suited to any day on which any first swarm is cast. On the evening of the eighth day from the date on the hive I listen a moment at the side of the

old hive; and if swarming has been "according to rule" I hear the young queen piping, when I know that a queen has hatched, and an after-swarm will be the result if not stopped. If no piping is heard I do not listen again till the evening of the 13th day; for the next rule is that the colony swarmed upon an egg or small larva being in the queen-cell, which allows the queen to hatch from the 12th to the 16th day after the first swarm. If no piping is heard by the evening of the 17th day no swarm need be expected. With cool weather and a failure of nectar very few after-swarms issue, or none at all; but with continued good weather and honey-flow, scarcely a colony will fail to try for after-swarming so that, with the bad weather, it is hardly worth while to listen at all. In nine cases out of ten, if the colony intends to swarm, the piping will be heard on the eighth day after the first swarm is cast, so that this listening is no tedious job, for not more than a moment is generally required at any hive. When it is heard, I go early the next morning and take every frame out of the hive, shaking the bees off from each (in front of the entrance) as I take them out, and return them again, so I may be sure not to miss a queen-cell, but cut all off, for we know that there is a queen hatched from the piping which we have heard. Once in a great while the bees will take a notion to go with the queen when she goes out to be fertilized, but such an occurrence is rare, and has nothing to do with what is known as after-swarming.

In the above two we have sure plans for accomplishing what we desire, under all circumstances which may arise, while those spoken of at first will work at times and at others not. The sure plan is to be preferred in the end, though it may take a little more time when doing it.

#### PROTECTING THE APIARY FROM THIEVES BY AN ELECTRIC ALARM.

I wish to protect my bees from thieves, with an electrical bell, such as you describe on page 266, 1895, but "I don't know" the first thing about putting up the wires. I might fasten them so the current would be grounded, or lose all of its strength before reaching the bell. Will a home-made battery, such as you use for wiring frames (described on page 105, 1895), answer? Does it need three batteries? Will an ordinary door-bell ring loud and long enough to wake a sound sleeper? I can get an electric door-bell for 75 cts. of Montgomery Ward & Co., Chicago; a battery for 50 cts., or the whole outfit for \$1.75, including 100 feet of insulated

wire, etc.; but this is simply a door-bell, and I don't know whether it is the right outfit or not.

There is a gang of wild boys here who take delight in robbing bees—not only mine, but all over the neighborhood. They took about \$3.00 worth of nice white comb honey from one hive last year, and held a grand pow-wow on the corners. I saw honey and wads of wax there the next morning; found out who was there, got the sheriff on track of them, but they denied having any honey or any knowledge of it. I could not prove it in court, or, at least, the prosecuting attorney thought so. No arrests were made, but the sheriff told me he knew I was on the right track, for they all showed guilt when questioned. I have lost honey every year. Sometimes they destroy the whole hive, and I am getting sick of it. I always give them all they want to eat, but there is no "fun" about it then. They like the fun of "cooning" it. I can't work hard all day and watch every night, so I wish to try some kind of alarm to wake me.

H. L. HUTCHINSON.

Mayville, Mich.

[The battery described in GLEANINGS, page 206, current volume, would hardly be suitable for an electric alarm; that is, it would be too strong and too expensive. The one that you mention, which you can get of Montgomery Ward & Co., including battery, door-bell, and insulated wire, is just about the thing, and the price is very reasonable. The bell should be stationed in your bedroom, and the two wires should attach the bell to a point outside the house. The bell and battery may be in the same room. Directions which go with the outfit would show you how to arrange the bell and battery, so there will be no trouble along that score. But very little wire will be needed. The spool of linen thread, mentioned on page 206, 1895, should be long enough to go clear around the apiary, or the space of ground that you wish to protect from depredations of thieves. As there explained, the thread should pass through eyelets fastened to trees or posts, and should be low enough, say about two feet from the ground, so as not to be seen by those who go into the apiary. As there explained, one end of the thread is made fast, and the other end fastened to a wooden plug that separates the two brass springs forming the two poles of the battery, as explained in our journal, 1895. By following directions there given, together with the directions that go with the battery outfit from Montgomery Ward & Co., I think you will be able to make the thing work all right.—Ed.]

#### QUEEN-BEES IN THE MAILS; SLIPSHOD QUEEN-BREEDERS.

The monthly Postal Guide for May is before me, and I see in the classification of mail matter that queen-bees are mentioned as admissible when *properly packed*, and this is a matter I think you ought to call the brethren to in big words of warning. Have a notice in every journal, and ask the other journals to do likewise. It is a serious matter, and one that needs attention. A few years ago I was going to write you, but neglected to. I got a queen, sent

me from a queen-breeder, in a second-hand cage. The candy was put into the wrong end of the cage; and in place of the cork he used a piece of corn-stalk. It must have dried out, or was too small when put in; anyhow, when I took the cage out of the mail-bag, the queen was nearly out. I just said then I wouldn't have had those bees get out in the mail for a dozen such queens.

C. M. HICKS.

Hicksville, Md.

[I am glad you have called attention to this matter, friend Hicks. We can not afford to lose the valuable privilege we now have of sending queens in the mails, by such carelessness on the part of queen-breeders. If there are any queen-breeders who put their queens up in any such manner as above explained, send us the particulars.—Ed.]

#### HOW BEES CHOOSE A LOCATION SOMETIMES, PREPARATORY TO SWARMING.

On page 293 of the A B C book you say that bees choose a location *sometimes* before swarming. This I know to be true. To-day it was verified. Yesterday, when I returned to the ranch, my brother told me that there was a lot of bees out in the wagon-shed. Going there to see what the matter was I found probably a hundred bees buzzing excitedly around some empty hives that I had tiered up. By dark all had disappeared. This morning I closed the entrance to all but one, the highest, and in the front tier I prepared it with frames of foundation, and left it. This afternoon the hive was taken possession of by a strong colony of black bees. They are not from my own apiary, half a mile away, as I have only Italians and hybrids.

JOHN M. FRANCE.

Moreno, Cal.

#### BOARDMAN EXTRACTOR AND OLD COMBS.

Does the Boardman solar extractor take out the wax of old combs near enough so that the refuse is not worth while fussing with, even with sulphuric acid?

GUSTAVE GROSS.

Milford, Wis.

[The Boardman wax-extractor, if used properly, will get almost every particle of wax out of old combs; but the old stuff needs to be stirred occasionally so as to let the wax out of the refuse. It may take a week, however, for all the wax to run out. The stuff that remains is hardly worth fussing with.—Ed.]

#### WEED DRAWN FOUNDATION.

A step in the right direction has been taken by our American cousins in the manufacture and introduction of the new "Weed" foundation, which must necessarily mean a saving of time and labor to the industrious insects; and experience has taught us that, where drawn comb is used, bees commence work much sooner. The "Weed" foundation will be especially useful in comb-honey production.—R. HAMLIN-HARRIS, Bristol, Eng., in *British Bee Journal*, March 18.

*J. M., Fla.*—We should be glad to hear from you further in regard to how you cured bee-paralysis; but, as you know, this disease very often goes away itself, and comes back again in some mysterious way which no one can explain. We should be very much inclined to question whether you have a remedy which is infallible.

*G. W. M., Pa.*—It is the usual rule among some honey-producers to kill all queens over two years old, as it has been found more profitable to do so. Young queens are more prolific, and consequently the colonies are stronger, and strong colonies mean honey; but where a queen-breeder has a valuable queen as a breeder, it is usual to keep her just as long as she will live, as her daughters of the last year are just as good as the daughters raised during the first year.

*C. H. P., Neb.*—We can not explain why the bees should be robbing the colony if, as you say, it is strong and the entrance contracted so that only two or three bees can pass at a time. Possibly they are black bees. Such bees usually do not make a very good defense. If you can put in a frame of hatching brood from a pure Italian queen, shortly after the young Italians hatch out, they will begin to defend the entrance. Italian bees are very much better than black or hybrid for defense.

*M. D., Ohio.*—It will be a good plan to cut out all queen-cells just before swarming-time, before putting on the supers. Some cage their queens at that time and then cut out the cells again. This effectually prevents swarming, and at the same time puts the bees into that condition where they will keep on storing honey in the supers. If the bees swarm out from under the super, you can take the queen out, as you suggest, or you can cage her; but you will need to cut out the cells in about eight or nine days, otherwise they will swarm out as soon as one of these cells hatches. To make sure that you miss no cells, shake the bees all off the combs, and then scan them very carefully, destroying all cells that you discover.

*C. H., Minn.*—It is quite a common practice to hive two swarms in one hive, especially if both are not quite as strong as the average. Of course, one of the two queens will be killed. It very often happens during swarming time that several swarms will come out at once, and then when they cluster together in one place it is the practice to take out enough to make one swarm and put them into a hive, and then another, and so on until there are as many swarms as

originally came out into the air. When they unite in this way there is no fighting; but there is a liability of there being a loss of some of the queens, owing to the fact that one or more queens may get into one bunch of bees and be put into the same hive.
